LALA LAJPAT RĀI

I. Early Impressions

BY ST. NIHAL SINGH

I

SIX years ago, on November 17th, Lala Lajpat Rai was flung from his earthly activities into the mysterious beyond.

Even now the tragedy of his passing overwhelms me. But a short time earlier I, then residing in Colombo, had received a hastily written note apologizing for not having fulfilled his promise to pay Mrs. St. Nihal Singh and me a visit and pledging his word that he would make amends as soon as he could.

A few years stood between him and me. His intellectual and spiritual outlook, at least in the beginning, differed from mine.

These differences kept us apart for a considerable time. But for them we might have known each other some twelve or fifteen years longer than we actually did. Of this matter I shall speak a little later.

Once we had met face to face, however, we took to each other instantly. As time went on our intimacy increased. He did not hesitate to ask me for introductions when he sailed across the Atlantic to the United States of America, then to him a strange land filled with people of whom he knew little. Several years later, when he started the *Bande Mataram*, an Urdu daily in Lahore, he prevailed upon me, busy almost to the shrieking point, to become its London correspondent. When I visited India I went to the jail in the city of his adoption to hold converse with him. After he had turned Swarajist, he visited England and learning that I had been pressed to accept the editorship of a daily newspaper in Colombo, chided me, as if I were a mere lad, for deserting my motherland; and secured my promise that I would train one or more of his young men in the art and practice of journalism.

During these years of intimacy we saw each other frequently whenever we happened to be in the same city—usually London, where such a large slice of my life has been spent. When land and sea separated us we exchanged thoughts by letter—he a far better correspondent than I.

Perhaps because he was an exile, more often than not through necessity rather than choice, he opened his heart to me, a voluntary exile through a great portion of my life. I thus came to see him from an angle somewhat different from the one from which others, associated with him in one undertaking or another, viewed him.

To know him was to love him. Few men I have known have been more lovable or more loving than he. Never was a more genuine patriot borne by Mother India.

II

Lalaji—as I and other friends of his usually called him—had shifted his legal

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

practice from the mofussal to Lahore just about the time I entered the Government College there. Soon after occurred an incident that awakened me to his presence in the capital of the Panjab. Mr. Robson, the Principal, took it into his head that all the students should wear blazers. With him, as I remember him, action followed thought with lightning speed. Without, I believe, consulting any of his colleagues, he issued an order carrying that idea into effect.

Had he discussed this matter with some of the senior students and roused their enthusiasm, a blazer might have been adopted without any dissent and might have become a symbol rousing pride among the under-graduates. Either that the thought did not strike him or he did not wish to take the trouble that such action would involve. He soon found however that the students were not putty to be moulded by him as he pleased.

Most of us did not know what a blazer was. It was necessary for us—myself included—to look up in the dictionary the meaning of the word, which we now heard for the first time. I discovered, upon consulting my lexicon, that it was a jacket, usually coloured or decorated in a distinctive fashion, worn especially for sports.

The play-grounds and hostels hummed with the word. Many of the students did not see the necessity of incurring expenditure upon a blazer. They could not understand why, when our predecessors in the college had not been asked to wear one, we should be ordered to do so.

Finding himself opposed, Principal Robson did a little propaganda work. He got hold of the students who took pride in presenting what they regarded as a "smart appearance," and used them to popularize his idea.

Then, all of a sudden, the controversy took a new turn. A small group of students announced that they had been talking with a pleader who had pointed out to them that while the colour of the blazer and the way it was cut and decorated, might be an important issue, nothing had been said of the cloth of which it was to be made. Was it to be of Indian manufacture and would the money for it remain in India to benefit the traders and workers of our country? Or was it to be imported from abroad and the money be drained away to add to the wealth of foreigners?

The pleader who had given this new turn to the blazer controversy was Lala Lajpat Rai. I had not heard of him before. He stood, at that time, at the foot of the ladder that was to enable him to climb to dizzy heights of fame.

III

I was urged by some of the older students who cherished a friendly feeling for me to accompany them to Lalaji's house. I would no doubt have done so but for another incident that occurred about the same time and prejudiced me against Arya Samajists.

A little explanation is necessary to enable the reader to understand the inwardness of this occurrence. Sikhism, as evolved by the ten Gurus, made no differentiation in respect of caste or sex. Such differentiation however asserted itself some decades after the demise of Guru Govind Singh—the last of the founders of the faith. Even "untouchability" crept in and certain groups among the Sikhs were treated as depressed classes and were known as *maxbi* Sikhs, etc.

Some Arya Samajists brought a number of Sikhs to Lahore and "purified" them in front of the sacrificial fire. Choudhri Ram Bhai Dutt* delivered a highly emotional speech that ended on the note: "now the tonsure ceremony begins."

Immediately the *maxbi* Sikhs took off their turbans and were shorn by barbers of their long hair and beards.

No love had been lost between the Sikhs and the Arya Samajists even before this incident took place. The tonsure ceremony added to the bitterness of feeling. It was taken by the Sikhs as an affront deliberately offered to them. It helped them however to see that between the theory and practice of

* Better known as Ram Bhuj Dutt Choudhri. He altered his name about the time he married Sarala Devi Ghosal, a niece of the Poet Tagore, as Dutt, though in the Panjab a Brahman caste, was not regarded as such in Bengal. I met him shortly afterwards and our friendship lasted until death claimed him. He told me in 1910, when I reminded him of this episode, that the "tonsure business" was a great mistake.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Sikhism there was a wide gulf; and led to a crusade against "untouchability."

I did not take the trouble to find out whether Lala Lajpat Rai had anything to do with this "affront" or not. Even had I been assured that he had not, it would have mattered little. I was soured against the whole tribe. The aversion I felt was not for a particular person or group of persons, but was of a generic character.

How foolish the attitude I then assumed was appears to me nearly thirty-five years later! But warm, red blood coursed through my veins when I was an under-graduate at the Lahore Government College and blinded me to the realities of life.

IV

It was easy enough for me to turn my back upon the opportunity to make Lalaji's acquaintance, but I could not become oblivious of his activities. They obtruded themselves upon my attention at every turn, through conversation, newspaper reports and (soon afterwards) leaflets and books.

Polemics seemed to be the very breath of his nostrils in those days. He appeared to be ever on the look-out for contention and if he discovered none did not hesitate to create one. As I told him years later, he reminded me of the Irishman who, happened to see two men going at each other with their fists, inquired eagerly: "Is this a private fight, or can any one join in it?"

No young man can remain indifferent, for any length of time, to a challenging personality like Lalaji's. I at least did not.

One of the earliest controversies in which he engaged interested me greatly, as soon as one of his admirers told me about it. The attitude of a section of our Muslim countrymen towards the Indian National Congress enraged Lalaji, who, almost from the very beginning, had been attracted by that movement.

He felt that they were doing a great disservice to their own co-religionists as well as to their fellow-nationals professing other creeds.

Instead of laying the blame upon the shoulders of the officials, he attacked the leader of this section of Muslims—Mr. (afterwards Sir) Syed Ahmed Khan. In hot haste he indited a pamphlet in Urdu in which he joined issue with the instigator of the separationist move, as he called it. The fire he put into the language he employed set youthful hearts aflame.

A copy of the pamphlet did not fall into my hands. I therefore set down here only what I remember of it as it was related to me at the time.

I distinctly recollect that it must have made as many enemies for him as friends—perhaps more enemies than friends. The Muslim separationists, whose number unfortunately grew rapidly, never forgave him for his attack upon their adored leader. They certainly never forgot it. Again and again in later life this matter bobbed up in the Indian Muslim mind and even many followers of the Prophet professedly nationalists in outlook and aspiration did not believe that Lajpat Rai could rise superior to credal and caste consciousness.

V

Had he not been so completely identified with the Arya Samaj—or rather with one section of it, as I shall presently mention—I have little doubt that his burning patriotism would have branded itself upon the minds of his—and my—generation. But for that fact we should have realized that he was much more than a staunch and active member of a protestant Hindu sect—a man who thought in terms of the people in general and of the country as a whole and not merely of the province upon whose strong breast he had been nurtured. His Arya Samaj work overshadowed everything else in his life in those days. Such indeed is the impression that I have carried all these years.

Before he had shifted his legal practice to Lahore he had fallen in love with the doctrines preached by the Maharishi Dayanand Sarasvati. The pristine purity of the Vedic times that that great teacher wished to revive appealed to his heart as nothing else had done.

Belief was no dead letter to him. It was an impelling force. It made him an enthusiast in the propagandist cause. He joined issue with Hindus of the old type who believed that caste was born with a man and died with him. True to the teachings of the Maharishi, he

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

held that caste was not in reality regulated by birth but by a person's *guna, karma* and *swabhava*. He also believed that image worship represented a decadent phase of Hindu thought. He inveighed against it in terms that lacerated the feelings of the Sanatanists.

His mind was not however of a negative kind. Destruction, as such, did not appeal to him. He demolished what he considered to be a mean building so that he might raise a magnificent structure in place of it.

VI

The work of rebuilding the nation, he then thought (as I afterwards heard from his own lips) could best be done through education. His concept of education was however materially different from that entertained by many of his contemporaries. He believed in a type of education that would free the mind from servility of every description, including subjection to Europe, which then held the Panjabi—indeed the Indian—mind in subjection.

He therefore gave all the time and energy he could spare from his professional work to the promotion of education—especially higher education—through private effort untrammelled, as far as possible, by official control. He went about the Panjab and the neighbouring provinces raising funds for the Dayanand Anglo-Vedic College that had been started not long before he came to Lahore.

Lalaji possessed a constitution of iron. It was nothing for him to visit four or five towns during the week-end and address one or more meetings at each place. He devoted the long vacations during which the Chief Court was closed to propaganda work in behalf of the "D. A. V." College, going from station to station, delivering addresses and collecting donations.

He possessed a silver tongue. More often than not he spoke, in those days, in Urdu, over which he had gained a mastery that surprised even his worst Muslim critics. His highly emotional oratory loosened purse-strings that ordinarily were held very tight. His words were potent because he put them into practice in his own life. At an age when most men waste their substance upon the pleasures of the flesh, he adopted a simple way of living so that he could save money to be applied to meeting the expenses of the "D. A. V." College. All his savings, at this period, were handed over to the managing committee of that institution. The example of self-sacrifice set by him, Lala Hans Raj and a few other Arya Samajists had, I remember, a most powerful influence upon young men like myself who were their juniors only by a few years.

VII

Had he not neglected his professional work in favour of his public activities he undoubtedly could have risen to dizzier legal heights than he did. He had a natural aptitude for law. His retentive memory enabled him to remember even obscure provisions in the legal code and to recall, without effort, judgments handed down by the Chief Court (it had not then been raised to the status of a High Court) and the Privy Council, which would be useful to his clients. Words came to him without fumbling for them, whether he was pleading in Urdu or in English, which he studied with great assiduity. His charm of manner and magnetic personality drew hearts to him. These assets enabled him to acquire a reputation at the bar that brought many clients to him.

Less able lawyers than he rose to the Chief (now High) Court Bench at Lahore. Lajpat Rai however never hankered for that or any other job. Quite the reverse. By cultivating interests that were unpopular with the officials, and by pursuing a manly, independent course, he gave umbrage to the very persons who had high office in their gift.

Many litigants insisted upon engaging him even though they knew that the law was only a matter of bread and butter with him, in preference to obtaining the services of legal practitioners who placed private gain above public good. Nor were they wrong in making that choice. Lajpat Rai possessed honesty of purpose that made him do his utmost for any client whose case he accepted. With his power of concentration he could master a brief in a remarkably short time, quickly seize upon his adversary's weak points and adopt a line of argument that usually enabled him to win the suit.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

The law therefore yielded him a rich harvest, at least judged by the standards of those times. I remember him telling me years later that shortly after joining the bar he had saved enough money to buy a house for his mother. A little later he was able to make it possible for his father (Lala Radha Krishan)—a schoolmaster—to retire and devote himself to the study of religions and ethical literature, which had fascinated him ever since his boyhood days, when he had sat at the feet of a Muslim teacher.

The work of studying briefs and pleading before the Courts held no interest for Lalaji except as a means of livelihood. He, in time, grew to hate the profession. On more than one occasion he spoke of it as "crooked." He declared : "It not only makes men dishonest, but also turns them into cowards." I reminded him that lawyers had played a great part in every movement for freedom.

"Lawyers are too calculating," he replied, "to risk their necks for freedom. They are the greatest cowards on the face of the earth."

VIII

In view of the hatred he had for his profession, he would have done far better had he taken to banking rather than to law. He had inherited a remarkable financial genius from countless generations of forbears. He was an Agarwal *bania* by caste. Many of his near relatives were traders and money-lenders, as his and their ancestors had been. His grandfather had been a village accountant who knew no characters other than the *Mahajani* ones, yet whose book-keeping was invariably correct.

As if his professional and public work were not heavy enough for him, he seized the opportunity that the Panjab presented during the first decade of the present century for organizing banking and insurance and was singularly successful in the enterprises he launched. I had it from his own lips that personal gain did not constitute the sole or even the main motive in his starting the Panjab National Bank and the Bharat Insurance Company. He felt that improvements in the material conditions of our people could be hastened by the organization of banking and insurance.

Not until financial institutions in which the people could place reliance had been created could they be expected to bring their treasure out from the holes where they had secreted it. Nor would it be possible, until such confidence had been inspired, for joint stock concerns to take root in the Panjab soil.

Lalaji realized that the methods of banking in vogue at the time, especially in his part of India, were antiquated in the extreme. Unless they were modernized, it was useless to expect that India would ever be able to compete successfully with Britain or any other country in any walk of life. He wished above all other things for our people to be financially independent. He knew that every other kind of independence was, in the last analysis, dependent upon economic independence.

He looked upon sound banking, moreover, as the hand-maiden of modern industrial progress. His reading—remarkably wide for an Indian in those days who had never left his native shores—had amply satisfied him in that respect.

Motivated by these diverse objects, he gave a great deal of time and energy to organizing the money-power of Panjabis. In this respect, as in many other ways, he was far ahead of his time. Conservative persons looked askance at his projects. They feared that it would be risky for them to invest their money in a joint liability company. They not only personally refused to embark upon such an enterprise, but used their influence to dissuade as many other persons as they could to refrain from doing so.

These were not the only difficulties that Lajpat Rai had to encounter at this juncture. He came into conflict with another Panjabi who, unlike him, had been educated at a British University and who had abandoned a professorial career to engage in banking in the province of his birth. Rivalry between the two inevitably resulted in friction and involved much waste of time and energy. I still remember the zest with which I used to await the publication of the leaflets that both parties issued frequently while the fight between them was proceeding in the early years of this century.

IX

About this time a terrible catastrophe occurred in the Panjab. An earthquake

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

wrought great havoc, particularly in the Kangra Valley. Thousands of houses were destroyed. Many villages were wiped out of existence.

The men, women and children left without shelter or means of subsistence were, if anything, worse off than their relatives and friends who had perished. Private agencies that could rush to their relief did not then exist, as they do now.

The agonized cries of these hill-folk were borne on the wings of the breeze to Lajpat Rai's ears. He arranged with friendly lawyers to look after his urgent cases and, accompanied by a party of young men who, at his command, would face any ordeal, proceeded to the distressful valley to render such succour as he could.

Men who saw him at work—some of them by no means enamoured of his Arya Samajist activities—never tired of praising the devotion with which he served these sufferers. Foreigners who had talked of Indians lacking both the instinct of humanity and the capacity for organization, were forced to revise their opinion after seeing his accomplishment in that connection.

X

The time was coming when politics would crowd professional and social activities out of his life. The work done by Mazzini (pronounced as if written "Matzini") for unifying Italy and freeing it from the Austrian grip had caught his fancy early in life. He had published a biography of that hero in Urdu that, to my knowledge, passed from hand to hand among young men of my generation. He did not however feel within him the call to devote his energies to promoting nationalism in India until after the close of the Russo-Japanese war, which I have reason to believe galvanized him.

Were Britain served in India at the time by an agent who possessed the gifts of imagination and tact, the victories scored by Asiatics over Europeans on the Manchurian battlefields and the Tsushima Straits might not have had the repercussion on Indian minds that they actually had. Lacking the ability to see beneath the surface, the Earl (afterwards the Marquis) Curzon chose the moment when a thrill of pride was running through every Asian breast, for forcing his will upon the Bengalis—then in the vanguard of Indian political progress. Instead of meekly submitting to the *fait accompli* as he no doubt thought they would do, they organized a movement that ultimately succeeded in upsetting the partition.

No one outside Bengal was more powerfully influenced by this Curzonian blunder than Lajpat Rai who had come to hate the policy of the officialization of the Universities that the Viceroy had inaugurated. That policy threatened the work to which the Panjab patriot had given the best that was in him almost ever since he came of age.

The spirit of independence that had actuated Lalaji to promote higher education untrammelled, as far as possible, by official interference and to engage in campaigns to file social fetters, led him inevitably towards the left wing of the Indian National Congress. He threw his influence into the movement for the boycott of British goods that had originated in Bengal.

There would have undoubtedly been a split in the Indian National Congress but for the skill shown by Gopal Krishna Gokhale in presiding over the session of that organization held in Benares in December, 1905. Lajpat Rai had raised the temperature in the Congress *pandal* by joing forces with Bal Gangadhar Tilak and Bepin Chandra Pal.

The details of the proceedings of that memorable assemblage reached me in China, where I was then engaged in journalism. It was apparent to me that Lajpat Rai was swayed by nationalism of an aggressive type. It was patent that he had no patience with the political sycophants who looked upon petitions and prayers as the keys that would unlock the door and set our country free.

XI

I was living in Chicago—the chief city, but not the capital, of Illinois, one of the mid-western States of the American Union,—when the news was published that Lala Lajpat Rai had been suspected of complicity in an agrarian trouble in the Panjab colonies and, with Ajit Singh (of whom I then heard for the first time) had been arrested. The telegram

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

reproduced in the American newspapers with which I was connected at the time was laconic. I knew that intelligence sent out from India could not always be taken at its face value and therefore eagerly awaited the papers from Home that would contain the full report of the affair.

When I finally had the opportunity of reading these accounts however I found them hardly more satisfactory than the reports in the American papers had been. That was not the fault of the reporters and editors of the Indian publications. They could only print such information as they could get hold of. In this case no details were forthcoming. There was only the bald fact of Lalaji's arrest and deportation. Everything else was conjecture.

After racking my brains in the effort to solve the conundrum I formed the view that Lala Lajpat Rai had been arrested under an ordinance of which I had never heard and without being so much as charged, much less tried, had been locked up in Mandalay, because the officials must have regarded him as dangerous. From my student days I had known that he was not in their good books. He was not one of those Indians who took off their shoes before entering their offices—who fawned upon them—remained standing while they were seated—retreated from their presence backwards like crabs, bending half-double with salaams. He cringed before no one, however mighty.

He never minced his words. Nor did he have any patience with the slogan: "Half an inch, half an inch, half an inch onward." He was for forcing the pace of progress at a rate that, I can easily realize, must have appeared "catastrophic" to the officials who had no use for him, and even less for the Arya Samaj, with which he had been so prominently identified since his early manhood.

My faith in Mr. John (later the Viscount) Morley, who, after the victory of the Liberal Party in England, had been appointed Secretary of State for India, had already been shaken. In Canada and the United States I had come across men who had closely followed his career when he was Secretary for Ireland and they assured me that he, as an official, was quite different from the Morley who prattled pretty platitudes about Liberalism from the private benches of Parliament or enlarged upon them in essays.

During my Indian tour in 1910-11 I expected to meet Lajpat Rai who had some time earlier been restored to freedom. To my great disappointment I found that he was away from Lahore on the only occasion when I could visit that city.

I did not have to wait for long. Shortly after I had taken up residence in Britain I received an invitation to attend a dinner that was being given in celebration of our "feast of lights," at which Lalaji was asked to preside. As we arrived at the hall in which the function was to be held a man of medium height, bold features and a sallow complexion shook us warmly by the hand and expressed his great pleasure at meeting us. He had a typical Panjabi face—pleasant to look at but conveying a suggestion of strength. His eyes were large and luminous. They showed mirth as well as flashing fire. The nose was prominent. The mouth was well-shaped. The lips were firmly set. Infectious laughter could ripple through them as I found almost immediately afterwards. Words could pour out of them that could lift men from their feet or (what is probably more difficult) could make them dip their hands into their pockets and bring forth money to finance a deserving cause.

It was hardly necessary for me to be told that I was meeting Lala Lajpat Rai—meeting him for the first time. No introduction was necessary. We felt as if we had known each other for years. I had devoured everything emanating from his pen that came my way and he lost no time in telling me that he had been reading my articles and books almost from the time they began to appear.*

ANGLO-JAPANESE RIVALRY IN COTTON INDUSTRY AND INDIA

By TARAKNATH DAS, PH. D.

GREAT Britain's national wealth and power is largely due to her national industry and export trade ; and her cotton industry has contributed considerably to augment British national prosperity. This national prosperity is seriously threatened by Japan which has successfully ousted Lancashire cotton goods from the markets of the world. The Japanese are determined to maintain their newly acquired markets by every possible means ; because Japan's loss of markets for the export of textile goods would mean economic chaos leading to bankruptcy and revolution. This aspect of commercial rivalry between Japan and Britain may produce serious international political repercussions.

From recent debates in the British Parliament, one can realize that there is virtually an economic war going on between Japan and Great Britain. In one of these debates Mr. Runciman, representing the National Government of Great Britain, assured the Parliament that the Anglo-Japanese commercial difficulty will be solved through negotiations. But it was quite apparent that many British statesmen did not share this optimistic view of the complicated situation. It is well known that in some quarters in Britain there is open talk about the necessity of retaliatory measures against Japan, if necessary by making a common cause with those nations in Europe and other parts of the world which are feeling the pressure of Japanese competition. More sober, yet definitely anti-Japanese policies were advocated by Hon. Mr. Bailey, a Conservative member of the British Parliament, representing Manchester, during his speech in the House of Commons on the 23rd of November 1933. Mr. Bailey has been reported to have said :

> "Today Japan was selling more all over the world than ourselves, and the reason was that twenty years ago Lancashire was blind to the danger. You could not prevent the Japanese competition by merely putting on a tariff. The fundamental difficulty was not our home market, but our oversea markets, where tariff could not be imposed by this country. *The Government should take steps to abrogate the most-favoured-nation clause with Japan as regards our colonies, and endeavour to induce the latter to accord to our textiles a preference, while as regards foreign countries we should bargain for purchases equivalent to our exports. The sale of second-hand machinery to Japan should be prevented, and apprentices should not be allowed into our engineering shops to take away our skill."—The Manchester Guardian,* Nov. 24, 1933.

It is generally asserted that the Japanese success in textile industry and capturing the world markets is due to lower wages of Japanese workers, so-called dumping method or unfair competition, depreciation of Japanese currency. Some even naively charge the Japanese of selling below the cost of production. Lord Snowden, whose patriotism as a British statesman cannot be questioned, has expressed his views on the subject in the following manner :

> "We are hearing complaints that Japan is driving us out of the Asiatic market. It is not long hours and low wages which are the reasons for this. There is nothing to be feared permanently from the competition of low wages and long hours. Japan's commercial success is due to her adaptability to the needs of the markets. For the countries with low purchasing power she produces an attractive cheap article of such a low quality that the British manufacturer says he would be ashamed to make it. If the British trader wants to capture these markets, he must stop blushing and face facts."

What are the real facts in respect to Japanese-Lancashire competition in textiles ? I, for various reasons, wish to answer this question, by quoting some interesting passages from an exceedingly well-informed article on "Japan's Way and Lancashire" published in

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the editorial page of the *Times* (London) of November 23, 1933 :

"The greatest direct menace to Lancashire is the meteoric increase of Japan's competition in our former markets. Ten years ago this competition was insignificant; five years ago it became acute in a few markets; today no market exists, to which Japan has access, where she does not undersell all comers by impossible margin. *With fewer than 9,000,000 spindles Japan has a larger export trade than Lancashire with 50,000,000; in five years she may eliminate us. To assess the true value of her striking force we must disregard tales of Government subsidization, selling under cost, and sweated-labour. The prosperity of Japan's export trade is due to her efficiency and organization of industry combined with certain adventitious benefits and natural advantages not possessed by Lancashire.*"

* * * *

"Largely owing to its modernity and an almost fanatical belief in scrapping the obsolete, the Japanese industry is equipped with the most up-to-date plant in the world. *There is not a single mill and scarcely a weaving-shed in Lancashire today which could produce economically* (*as measured from the mechanical standpoint*) any of the mass-produced cloths which forms the backbone of the Japanese industry, no matter how elastic and accommodating trade-union regulations might be."

* * * *

"The all-powerful influence in Japanese progress is the immense driving power of its organization and direction. This embraces complete knowledge of every requirement of the productive side of the industry, combined with instant contact with demand in all parts of the world, relating the one to the other in the manner best suited to Japan. Absolute control is in the hands of the Japan Cotton Spinner's Association, which governs the industry's entire spindlege and 60 per cent of its export looms, and by dominating the entire yarn output, has a scarcely less effective control of the independent looms···The pattern on which this marvel of industrial enterprise is built is not a chance product, but a carefully planned edifice of unshakable strength in which the builders have utilized complete knowledge of what is aimed at with every process through which the raw material passes. Such comprehensive knowledge in those controlling the industry is the key of Japanese supremacy. It implies an economy of production beyond the power of an industry in which ignorance of the next of final purpose is intentionally preserved by those in charge of each section. Until this medieval obstruction between each horizontal layer of our industry is removed Lancashire can never hope to challenge the single-minded effort of Japan. The horizontal structure of the Lancashire industry is largely responsible for its decadence; it maintains a perpetual clash of interests between one section and another; it excludes the master-hand and the master-mind···"

The sum and substance of the above arguments regarding Japanese ascendency is that Japanese national efficiency in the whole field of textile industry—production as well as distribution of the product in world markets—is far superior to that of Great Britain. Japan is beating Britain at her own game. Japan is demonstrating that "Anglo-Saxon superiority" and the so called "Asiatic inferiority" is a myth. In the past western admirers of Japan often classed her as an excellent imitator without any originality and ability to assimilate. This has also been completely disproven.

The Anglo-Japanese struggle for world markets are fought in many lands; but India is a very important battle-ground. In India Britain has the initial advantage over Japan, because of Imperial Preference and discriminatory legislations against Japan. Under the present circumstances Indian cotton mill-owners have no chance to compete with Japan even in India, although they have easy access to raw materials, home markets and the cheapest labour. This is due to the fact that Indian national efficiency in textile industry is far inferior to that of Japan. This inferiority is not due to any innate inferiority of the Indian people. There was a time when Indian textiles had ascendency all over the world. It is due to the selfish policy of Indian capitalists—textile mill-owners who are most concerned with their profit and not anxious to spend any substantial part of their profit for raising the efficiency of workers and bettering their plants. To make this point concrete I wish to emphasize that Indian mill-owners during the last twenty-five years have made profits of several millions of pounds sterling; and if they were anxious to raise Indian national efficiency in the field of cotton industry, they might have spent one per cent of their profit for providing facilities for the study of textile engineering in India! Alas there is not one institution in India where the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

technique of the textile industry is adequately taught. What have the Indian mill-owners done to raise the standard of efficiency of Indian workers? Indian mill-owners like many other Indians wish to get something for nothing. They even now are not concerned with the question of raising Indian national efficiency but howling against the supposed "Japanese dumping" and siding with Lancashire cotton magnates against Japan; because Indian mill-owners think that by taking such a stand they may secure such favourable legislation—high tariff—as will help them to make easy profit. Lest I may be misunderstood, I wish to say that for the purpose of protecting an infant industry tariff may be justified; but by mere imposition of tariff and without systematic efforts for increasing national efficiency no nation can build up an industry nor maintain it. The question that comes before me is this: Are the Indian politicians and industrialists as well as educators doing their best to raise India's national efficiency?

Anglo-Japanese rivalry in world commerce is bound to be more acute than it is today; and it may lead to a serious international consequence, because every economic conflict, unless peaceably solved, is bound to lead to a political conflict. One of the underlying causes of the Anglo-German conflict was Anglo-German commercial rivalry; and Anglo-Japanese commercial rivalry is no less acute today than was the Anglo-German commercial rivalry in 1910. Here lies the real seriousness of the situation. Unless the Indian people—especially Indian industrialists, capitalists and political leaders—show evidence of practical and genuine patriotism, then the present day Anglo-Japanese economic rivalry, instead of becoming an indirect impetus to India's economic and commercial regeneration, may become a source of terrible misery and degradation.

THE INDIAN RENAISSANCE IN MEXICO

By SUNITI KUMAR CHATTERJI, M. A., D. Litt. (London)

SOME time ago I read in the *Literary Digest* an item of news about Mexico which both surprised and pleased me. I felt surprised—at seeing the impossible happen, at seeing the coming back to life of what we all knew to be dead; and I was pleased to see that a people which had built one of the great original cultures of the world and which had lost its very soul and was being crushed out of existence through centuries of extraneous tyranny and pressure was at last recovering something of its consciousness and was trying to get back something of its spiritual and cultural life. I am a man of the present age, and I am a Hindu: and for both these reasons, the necessity of each kind of culture, of each type of religious experience and faith continuing its own existence (in so far as it is in harmony with the rights of others) and maintaining its honoured place in the comity of cultures and creeds strikes me as something axiomatic. Unity in the midst of variety, and variety in spite of a fundamental unity—this is what appears to be most desirable in life: in fact, life is nothing but that; consequently I would consider it a sin if an attempt is made to destroy a particular localized expression of a common and universal human culture and human mentality. It would thus be only natural for me and for others who believe in the fundamental unity and the inevitability and justification of the civilizations and in all kinds of human endeavour that manifested themselves in different lands at different periods, to feel glad when some unique type of culture and mentality seems once more to be on the eve of a new existence, for the enrichment of the spiritual and mental experience of the whole of mankind.

To cut short this preambulatory digression—the item of news regarding Mexico was simply this; that the Mexican Minister for Education had circularized to all the schools in the land to the effect that school children were to be told that it was *Quetzalcoatl*, the benign deity of the ancient Mexicans, who gave children presents on Christmas Eve: the name of Quetzalcoatl was to be substituted for that of Saint Nicolaus, the familiar *Santa Claus* of English children. In the Christian lands of Europe little children are taught that Saint Nicolaus or Santa Claus comes down from heaven on Christmas Eve with a bag full of toys for them, and children keep their stockings near their beds for Santa Claus to fill them with his gifts, and when they are asleep, parents act on behalf of the Saint, filling their socks with things that would please them when they wake up the next morning. This is a pretty domestic custom which adds greatly to the joy of the children. The story of Santa Claus seems to have originated in the cold lands of Northern Europe where it is all snow and ice at

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Christmas time. Santa Claus largely embodies in himself some of the old Teutonic and Slav conceptions of godhead—at least in his appearance and his habits. He is a jolly old man with a red nose and a snow-white beard, dressed in a fur-lined coat and cap of red collar, with top-boots, and he comes riding along the snow on a sledge. He is a veritable god of Christmas cheer, kind and jovial, the beloved Father Christmas of children. Saint Nicolaus came down to the warmer lands of Southern Europe, and did not lose a bit of his popularity. With the other gods and godlings of the Roman Catholic pantheon this presiding deity of Christmas time lost no time in coming to Mexico after the conquest of that country by Hernando Cortes and his Spaniards in 1521. Mexico as a civilized country possessed its own religion and other institutions. But after the fall of the Aztec empire, the national life was crushed entirely. The old religion was taboo, and a *regime* of the worst type of religious persecution and suppression was inaugurated which went hand in hand with wholesale forcible conversion. The old gods of Mexico had to yield to the new ones of Christianity, but the olds are very hard to kill—their attributes and functions and their functions lingered on, and were foisted on the foreign gods—called Saints and Angels—imported from Europe. Saint Nicolaus also came, although his costume and his sledge would be totally out of place in a land like Mexico, and there are hundreds of thousands of sandal-wearing Mexican children who never saw snow or a sledge and who never wore socks in their life which they could hang on by their beds for Santa Claus's toys. The circular of the Education Minister of Mexico was just to save the Mexican children from this silly and ridiculous imposition. Quetzalcoatl was the ancient Aztec deity of all the gentler virtues—kindness and civility, and arts of peace. He was the only Aztec god to whom human sacrifices were not offered. The Aztec and Maya-speaking Mexicans have not wholly forgotten him, although they have been Christians (even if only in name) for the last four hundred years. It would only be natural for a Mexican child of American Indian origin to think of Quetzalcoatl or some other god, at the time of festivity, more than to think of a fur-clad Santa Claus, and when they would think of Quetzalcoatl, they would unconsciously feel a sort of national pride in their past, of which Quetzalcoatl is but a symbol. All these evidently were in the mind of the Mexican Minister for Education when he sought to graft the name of a Mexican deity upon the greatest of Christian festivals,—when he attempted to bring about a remarkable type of synthesis in which the thought and imagination of ancient Mexico was combined with Christian and European institutions.

A similar synthesis has been effected by Indian Muslims also. The cult of Allah and His *Rasul*, and the idealism of Iranian Sufidom, have not been able to eradicate from the deepest consciousness of the Indian Muhammadan the world of ideas of his Hindu forbears. And in many a sphere a compromise has been effected; and in spite of the sporadic attempts of Muhammadan orthodoxy which pins its faith on the Koran and on the Traditions, this compromise forms the actual or living faith of the larger portion of Indian Muslims. This kind of compromise is the rule in Indian Muslim art of all kinds—architecture and painting, music, and literature. As a typical example, mention may be made of that oldest and most important Urdu drama—the *Indar Sabha*. It is a musical ballet with a very slender plot, with the thinnest of love stories with a happy ending in the background, but it is a curious mixture of Hindu ideas and those of extra-Indian Islam. The work was composed in 1853 by Amanat, the Muhammadan court poet of the last independent Muhammadan ruler of Oudh, Wazid Ali Shah. In this work, in the court of Raja Indar—Indra, the King of the Gods, that is—*Paris* (from the Paristan of Persia) sing and dance in place of the *Apsarases* of Hindu mythology, there are no Hindu *devas*—gods—in Indra's heaven,—only two *Devs* or Demons from Persian mythology figure. *Lal Dev* and *Kala Dev*, the Red Demon and the Black Demon, who obey the behests of Indar. The *Paris* are named *Pokhraz Pari*, *Nilam Pari*, *Sabz Pari*: they make their obeisance to Allah, and sing in Indar's court. The King of the Gods has been transformed into a sort of inferior angel, and the sanctity of the Muhammadan *Bihisht* or Heaven has been kept intact by having Indar's *Sabha* or assembly in a separate and far away locality. No one objected to a compromise like the above,—neither the Muslim King, nor his courtiers, nor the three generations and more of Indian Muslim audiences who have been applauding the play in the theatre, and recently in the talkie.

To come back to Mexico. We may ask ourselves—what is behind this circularization by the Mexican Minister for Education? What does this gesture symptomize? On the face of it it appears so puzzling, that in Christian and a Hispanized country there should be official propaganda for the suppressed culture of the Aztecs and other "Indians." Who are the people of Mexico—what are they really? How do they live, and feel, and what do they think? How is it possible for the cult of Quetzalcoatl to be revived—even in this decorative form—at this late hour? In asking ourselves these questions, if we take stock of the actualities all over the world, one noteworthy thing at once presents itself before us, and it is this: that this desire to build up once again the broken link with the age-old spiritual and national culture in Mexico is no isolated thing; it is a product of the Time-spirit,

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

which has manifested itself not only in Mexico but in all lands with a history and a past, where the surging waves of national renaissance is breaking the immediate past, and under the impact of this incoming tide the edifice of a superimposed Christian and Islamic mentality is being battered and broken in many a land.

The original inhabitants of America are believed to have come over from Asia through Siberia and Alaska crossing the Behring Strait at some prehistoric epoch: in fact the Red man of America is distinctly a modification of the Yellow man of Asia. Once in America, they rapidly spread all over North and South America and under altered climatic and other conditions they slightly differentiated in the different tracts. In some parts of the present United States the Red man developed fairly advanced types of culture, but the highest achievement in civilization of the American Indian took place in Mexico and Yucatan, and second to that in Peru and Bolivia. Various American tribes in Mexico and Yucatan built up a city culture of a very high type which included architecture and sculpture, painting, and other arts and crafts, and astronomy among the sciences and the beginnings of this culture go back to centuries long before the Christian era. The cultured groups of Mexico fall into a number of related tribes, like the Nahua, the Tarascan, the Otomi, the Totonac, the Mixtec, the Zapotec and the Maya-Quiche, which spoke different languages but were nevertheless of the same race and possessed virtually the same culture. Of these tribes, the Maya-Quiche were by far the oldest and cleverest nation of ancient Mexico, whose art and whose huge temples in South-eastern Mexico and Yucatan still excite our wonder, and whose astronomical studies have been described as the foremost intellectual achievement of ex-Columban America. To explain the situation in the Mexican world in terms of that of the Mediterranean world of antiquity, the Maya have been compared to the Greeks, and the Aztecs (the most prominent of the Nahua tribes to the Roman, while the other tribes are like the lesser nationalities of ancient Italy.

The Zapotec ruins at Mitla as much as the Maya temples at Chichen-Itza and elsewhere and some of the Aztec edifices are as noble as the architectural achievements of any people on earth. It will not be quite *a propos* to give a sketch of Mexican culture and to appraise the nature and value of Mexican civilization: for that purpose there is a modest but exceedingly well-written literature in English. The greatest blot on Mexican culture was human sacrifice on a terribly large scale as a most important rite of their religion. These human sacrifices were as frequent as they were cruel, and Mexican international or inter-tribal politics was largely based on this practice of making war to have captives for the sacrificial altar. The Aztecs were particularly guilty in this respect. But in this matter we have the voice and evidence of the Spanish Christian priests only. Apologists finding the *raison-d'etre* for this barbaric rite have not been wanting among recent historians and students of Mexican culture and antiquity; and while condemning this aspect of old Mexican religion and culture, we need not shut our eyes to the nobler aspects of Mexican religion where we can join hands with the Aztec priests, forgetting for the time being the blood that is on them from the hearts torn out of the palpitating breasts of human victims sacrificed by the dozen and the score. Leaving aside the tribes like the Mayas, the Zapotecs and others, we can take Aztec religion as typical of the rest of Mexico at the time of the conquest. The Aztec pantheon consisted of a large number of gods and goddesses, and in its richness and variety this pantheon can bear comparison with those of India, Greece, Babylon and Egypt. But three deities were outstanding figures in the Aztec Olympus—namely, Huitzilopochtli, the terrible God of War, the particular tribal god of the Aztecs; Tezcatlipoca, the God of Storms, of Life as well as Death; and Quetzalcoatl. Tezcatlipoca reminds us of our Siva in both his terrible and benign aspects—he was a Cosmic force, embracing life as a whole, he is cruel and death-bringing, and at the same time he is a god of truth and wisdom and a god of mercy. Quetzalcoatl by contrast may be compared to our Vishnu. These Gods were worshipped by most other tribes: among the Maya-Quiche, Tezcatlipoca (particularly in his aspect as a Storm-God) was known as Hurakan, the source of the English word *hurricane*; and Quetzalcoatl was known as Kukulcan, or Gucumatz. There is plenty of evidence to show that the Mexicans—at least the Aztecs—were developing the idea of monotheism through the figure of Tezcatlipoca. Some of the old Aztec prayers to this deity are as fine things as any in the way of prayer and praise, and reveal to us the height of nobility and the depth of sincerity and faith which the man-sacrificing Mexicans were capable of. To give one such prayer to Tezcatlipoca:

> O mighty Lord, under whose wings we seek protection, defence and shelter! Thou art invisible, impalpable, as the air and as the night. I come in humility and in littleness, daring to appear before thy Majesty. I come uttering my words like one choking and stammering; my speech is wandering, like as the way of one who strayeth from the path and stumbleth. I am possessed of the fear of exciting Thy wrath against me rather than the hope of meriting Thy grace. But, Lord, do with my body as it pleaseth Thee, for Thou hast indeed abandoned us according to Thy counsels taken in heaven and in hell. Oh, sorrow! Thine anger and Thine indignation are descended upon us in all our days...
>
> O Lord, very kindly! Thou knowest that

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

we mortals are like unto children which, when punished, weep and sigh, repenting their faults. It is thus that these men, ruined by Thy chastisements, reproach themselves grievously. They confess in Thy presence; they atone for their evil deeds, imposing penance upon themselves. Lord, very good, very compassionate, very noble, very precious! let the chastisement which Thou hast inflicted suffice, and let the ills which Thou hast sent in castigation find their end!

The name Tezcatlipoca signifies "Smoking or Fiery Mirror," (*Dhumradarsa*, or *Jvalan-mukura*, to translate the name into Sanskrit) a round mirror of obsidian stone with fire or smoke issuing from it, signifying his power of seeing everything as in a mirror and his control over everything as of the wind over smoke, forms his symbol. Quetzalcoatl or Kukulcan means "feathered serpent" (which may be rendered into Sanskrit as *Patri-sarpa* or *Patri-naga*), a name and a figure of mystic significance, probably hinting at the god's control over the elements, like a bird on the wing and a snake under the ground. Quetzalcoatl is a civilizing deity, he is also a hero-king, and it is he, as his rites were never stained with human blood in Aztecland, who has now been set up as a fitting symbol of a revived interest in and an intensifying appreciation (we cannot as yet call it a passionate love) of the old culture of Mexico.

Ancient Mexico was thus a land of flourishing culture and was already on the way to unification as a great nation or confederation under the warlike and powerful Aztecs. The human sacrifice which was a blot on their culture would have died out gradually, as it has done in other parts of the world: it was a rite favoured particularly by the Aztecs, but other forces were already working against it. If Mexico could work out her destiny unimpeded by the disastrous foreign assault under the Spaniards, we might have seen the spectacle of a new type of culture independent of that of the old world come to full perfection. But Fate has relegated it to the lumber room of the might-have-been, and has deprived humanity of the richness and the novelty of a fresh cultural and spiritual experience. Nevertheless, the ancient culture of Mexico holds an honoured place among the results of corporate human endeavour and takes its stand worthily beside the ancient cultures of Egypt and Mesopotamia, Japan and China, Greece and India, and of medieval Europe as a great expression of creative energy.

The Spanish conquest came over Mexico as a scourge from God and the peoples of Mexico had to leave their task unfinished,—their destiny remained unfulfilled. To all cultured men this will be regarded as a loss to the world. Mexico fell, and seemed to fall for ever. Her ancient peoples have not wholly died out—the Aztecs, the Otomis, the Tarascans, the Zapotecs, the Mixtecs, the Mayas and the rest are still there in their hundreds of thousands, but they have been brought low; they are completely shorn of their past glory through the last four centuries of contact with Spanish rule, which was so long based on a complete denial of their past and its achievements. All life has been crushed out of the Indians of Mexico through Spanish economic exploitation and religious intolerance and persecution. The history of Mexico for the last four hundred years, from the conquest in 1521, is a history of the gradual decay of the mental and spiritual culture of the native peoples, over and above their economic enslavement. The Aztecs and the other Mexican tribes fought the Spaniards with a superb heroism, but they could not resist the better armed and better armoured cavaliers of Spain: The Mexicans did not know the use of iron—it is surprising how they could raise such huge stone structures and could execute such detailed sculpture work without iron tools. The Spaniards continued the deliberate and systematic destruction of the native culture which had begun with the conquest, with the idea that they were doing a thing pleasing to their God. A most ruthless programme sought during the whole of the 16th century and later to do away with all the vestiges of the old religion and culture. Perhaps nowhere else in the world has the work of destruction been carried on on such a large scale. Wherever the arm of Spain extended in Mexico (as in other parts of America, people were forcibly made to acknowledge themselves as Christians, and their old temples, images, art and literature (the Mexicans had different systems of picture writing, and had a large literature with MS. books, a few of which have somehow escaped destruction and are now being published and studied by scholars) were destroyed. After which the masses were made for all practical purposes the slaves of the conquerors.

But although they were suppressed in this way the people of Mexico did not die. Outwardly forced to accept the Spanish yoke, in both economic and cultural life, the enduring vitality of this ancient and civilized race gave a subtle resistance from within. By a sort of apparent placidity which was nothing but a non-violent opposition offered by a whole people—although unconsciously—the ferocity of the spirit of the Conquistadores and their Padres has been very much whittled down. The conquerors are finding themselves conquered by the environment: they are becoming slowly and inevitably merged among the Indian people. In 1805, the different elements in the population of Mexico were as follows:

Spanish (more or less pure)	1·1 millions,	18 p.c. of the total population
Mestizo (mixed Spanish & Indian)	over 2 millions	38 p.c. „ „
Pure Indian	2½ millions.	44 p.c. „ „

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

According to the estimates for 1910, the percentage indicated below would show how the Spanish element is being absorbed :

Spanish	1.1½ millions,	7.5 p.c.
Mestizo	8 millions,	53 p.c.
Indian	6 millions,	39 p.c.

The second class—Mestizos—are mainly Indian in blood, and in their outward appearance, way of life and their temperament they approximate to the Indian rather than the Spaniard.

The history of Mexico from 1531 to 1917 meant, both to the Mexicans and to the people outside, the doings of the foreign or settled Spanish people in the country. Nobody cared whether the Indian masses existed in the land at all. They were simply native *peons*, simply Indians who were to be suffered to exist as they supplied the labour, which alone made the country go on. Their old faith and ritual was destroyed, or very nearly destroyed—they followed a curious amalgam of Spanish catholicism and their own ideas and institutions. They had their own languages, Aztec and Maya and the rest, which at one time were vehicles of the finest literature the people of the New World produced but there was no study of it, and Spanish was forced on them. There was no unity, and no aspiration for unity ; the memory of their ancient feuds dating back to the pre-Spanish period still lingered in their minds. There were no leaders, as the aristocratic and thoughtful classes had all made the supreme sacrifice during the conquest. It was not possible for the Mexican masses—stunned and made dumb by the calamity of the conquest and the subsequent ruthless exploitation —to be articulate, and to seek an expression of themselves through a cultural life or rebirth.

During these four centuries, again, through the dominant influence of the culture of Spain and Europe, the Mexicans themselves altered a great deal, both in their outer economic life and in their spirit. But the impositions from the outside were slowly engrafted, and have been properly assimilated : otherwise the Indian population would not have lived on and increased. The Spanish contact has been responsible for the introduction of many of the amenities of European life among the Mexicans. The Spanish language, when all is said against Spanish occupation, has proved to be a blessing even when we regret that the development of Aztec and Maya speeches as great modern languages of America could not take place. A perfect Babel prevailed, and does prevail among the different Mexican tribes. There are according to one competent authority, 192 American Indian languages and dialects current in Mexico, to which we might add another 62 which have now become extinct ; another view brings down the number to 59, distributed among 20 different families. About half Mexico is still purely Indian in language ; the other half has been Hispanified. Of the major Indian languages, Nahuatlan or Aztec is spoken by about a quarter of Indian-speaking Mexicans, namely, by some 650,000 people ; then comes Maya, 400,000 ; Zapotecan, 350,000 ; Otomian, 350,000 ; Totonacan, 75,000, and Tarascan, 40,000. The Hispanification of Indian Mexico in language is proceeding rapidly, much as a philologist would regret the ultimate loss of those interesting and historical forms of speech, the unification of the Mexicans by a great Indo-European language like Spanish will not be an unmixed evil : on the contrary it will be a blessing in disguise. The Mexicans cannot deny the last four hundred years of their national existence, and Spanish has been the predominant tone, at least outwardly of their modern life and culture. The Christianity of Mexico has on its popular side preserved a great many things connected with the old religion, among which the most noteworthy are the old dances in feathered costumes reminiscent of the pre-conquest period. The Mexicans have nationalized the Virgin Mary into a great Mother goddess who has a special pity for the Indian masses and at the shrine of Guadalupe near Mexico city the image of the Virgin is fast becoming a sort of palladium for native Mexico to which the pent up faith of the suppressed millions is aspiring. The ancient habits of life are still going strong : the old Aztec and other types of houses still persist, with a great deal of the old type of furniture ; the people have as their staple food maize *tortillas*, or *chapatis* as we would call them in India, made of maize dough mashed over a stone slab by a stone pestle (in the style we pound and pulp our spices into paste for curries), which they eat with local peas and vegetables and meat highly seasoned with chilis.

The frame-work of economic and social life has on the whole persisted and it only requires freedom of movement, a little economical amelioration and education for the masses of Mexico to grow once more into a great nation, worthy descendants of the ancient Aztecs and Mayas.

The Spanish connexion with a viceroy periodically appointed by the king of Spain, was a great economic strain on Mexico, the land with its agricultural and mineral resources being ruthlessly exploited for the benefit of the Spanish royalty and its satellites. The Spaniards who had made Mexico their home felt the pinch more than anybody and with the Mestizos and their Indian tenants they rebelled against Spanish authority. Armed resistance began in 1808, and in 1820 Mexico, with her destinies in the hands of the Spanish upper class, became virtually free. Mexico was rid of a perpetual stream of needy, fortune-hunters in quest of offices and emoluments and privileges from Spain. This stream was closed after the independence, and the native people both Mestizo and Indian, freed from this perpetual drag on their progress, came to the forefront. But nobody looked at the situation from the point of view of the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

submerged Indian masses who were practically slaves bound to the soil. For them the "independence" of their country did not mean much change. In 1877 Porfirio Diaz became the President of Mexico, and from 1884 to 1911, he was continually President and uncrowned autocrat of Mexico. Diaz gained considerable popularity abroad by giving foreign commercial people and exploiters of Mexican resources, considerable privileges at the expense of the Indian masses. A superficial prosperity marked by an increased volume of commerce and building of roads and railways characterized the period of his domination, but the Indians were slowly being driven to desperation by certain old privileges and rights such as the communal ownership of the land being taken away from them. In the meanwhile a sort of pride in the past of Mexico and a changed attitude towards the achievement of her ancient peoples was making themselves manifest among the ever-decreasing Spanish elite of Mexico and the ever-increasing group of Mestizos. The solid block of the Indian masses for the first time began to be given recognition, and cultured Mexicans of Spanish origin realized the great qualities of the people which still retained an ingrained sense of art and civilization even in the days of their fall and full decadence and sought to make amends for the injustice of the centuries done to them. The Mexican *Intelligentzia* turned to the people for inspiration in their life and work. Artists studied their own people with a sympathetic eye and scientists began to advise a more rational attitude towards Indian life and mentality than that preached by the Roman Catholic Church. An anthropologist like Manuel Gamio showed the proper way of guiding the Mexican masses, simple and yet inheritors of a great culture. Of the artists Diego Rivera's is the greatest name, and Rivera is acknowledged to be one of the greatest artists of the world today, a man of international fame. He turned to the Mexican people, and his sympathetic rendering of the life of the masses of Mexico is one of the great things given to the world by art and by Mexico.

In the field of politics and economics and legislation, the influence of this altered attitude began to make itself felt. After a number of revolutions, the famous land law of Mexico was passed in 1917, which has rehabilitated the Mexican peasant and has enabled him to make a fresh start in life to work out his destiny. With the attendant economic freedom, they are now in a position to improve their lot along lines most suitable to their environment and history. With the sort of education inaugurated for them by Gamio and Atl and other leaders of Mexican thought, they are being brought to a position when they can *find themselves*—understand the value of their past culture and give once again their best to the world.

All this movement—economic and cultural—has been called the Indian renaissance in Mexico. (It was through Columbus's mistake that he discovered India when he reached America that the original people of America got the name which properly belongs to us—an original "native" in Spanish America is an *Indio* just as his brother in Anglo-Saxon America is an *Indian* or a *Red Indian*.) One remarkable thing in this Indian renaissance of Mexico is that the descendants of the Conquistadors, among whom the bluest blood of Spain is well represented, have joined wholeheartedly in this "native revival" and naturally enough, it is their superior intelligence and power of organization which has inaugurated the movement and is helping it on. Dr Atl, one of the Spanish leaders of this movement, is typical of these highly cultured men. His original name was Gerardo Murillo, but he has taken an Aztec name (*Atl* means 'water' in Aztec) in order to show his whole-hearted interest in this Mexican renaissance. Another artist, a lady named Carmen Mondragon, has assumed the Indian name of *Nahui Olin* ("the Four Movements of the Sun").

The Indian masses of Mexico never lost their innate courtesy and their sense of beauty. Their folk art is one of the most exquisite things in the world. The woollen *Sarapes* of Mexico or small blankets with a slit in the middle (the garment which is called the *poncho* in Equador, Peru and Bolivia) which forms the characteristic coat of the Mexican peasantry, are woven by hand-looms in most marvellous designs and colour-schemes, and modern decorative art is learning something from these *sarape* designs. Decorated pottery is another old Mexican art which received a fresh impetus from the Spaniards, who taught the Indians a good many things from the coloured pottery art of Europe. The Indian sense of design and colour is wonderful. The leaders of the Indian renaissance have given a great impetus to Mexican folk art, and by holding exhibitions and festivals they are reviving the interest of the people in their national art, their old dances and civic ceremonies, and their regional costumes. The people of Mexico are quite content to follow the lead of the Education Department in this matter.

The power and prestige of the Roman Catholic priesthood began to wane as a result of this national and cultural revival. Education began to undermine the influence of the priests. Unfortunately for the Roman Church, its hand on the economic life was a heavy one, and the morals and piety of most of the priests were deplorable. The Roman Catholic Church owned a great deal of the land, and when the agrarian law of 1917 was promulgated, the Church joined hands with the big *haciendados—zamindars* as we would call them in Bengal—and with spiritual

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

influence persuaded certain sections among the illiterate Indian masses to rebel against the law. The result was that counter-revolutions and small religious wars started and the Roman Catholic Church tried all its weapons of excommunication and cursing delinquents to eternal damnation, besides inciting its supporters to armed revolt. But the mass of Mexican peasantry remained sound and rallied round the regime which gave them land and liberty. The Mexican Republic finally in disgust and as a necessary self-protective measure banished all Roman Catholic priests who would not register themselves with the Government. After the long period of four hundred years, Mexico at least became free from the Roman Catholic imposition. This has been a great help to the Indian Renaissance.

It would of course be a great exaggeration to suggest that the worship of Quetzalcoatl and Tezcatlipoca, of Tlaloc and Xilonen could be revived once again, or that the better and bright side of Christianity would ever cease to influence the Mexican masses. The old traditions are gone: although here and there some fragments of it are peeping behind Roman Catholic ritual—there are always these heathen idols behind Christian altars—it would be too much to expect a wholesale revival. But the Mexicans will not regard, as they have always been taught to do so by the Christian *Padres*, that when their ancestors loved and worshipped was merely they did so at the instigation of Satan. It can be hoped that they will feel a proper glow of pride in the achievements of their ancestors, and they will accept thankfully from their national life and culture and from the religious heritage from their ancestors those elements which are noblest and which are most enduring and can help to build up a noble and beautiful character, and will consciously harmonize it with the moral training and discipline of Christianity. They will be able to beautify their lives much more with the aesthetic sense of old Mexico. And they will be established once again in self-respect and self-confidence through this revived self-knowledge.

After four long centuries, Mexico is becoming alive once more to her ancient natural culture. A similar thing has manifested itself among the Turks, and from time to time we get glimpses how it is reacting upon the Moslem side of the Turkish character: the Turk now wants to be great as a *Turk*, and he does not want to suppress the *Turk* by the Mussulman: the faith born in the desert of Arabia has not been congenial to the man from the steppes of Central Asia nurtured in the atmosphere of Byzantine Greece—that is the opinion of many a Turkish intellectual and thought-leader. The highly-cultured Aryan Persian was conquered by the Semitic Arab in the 7th century, and had to adopt the latter's creed. Persia has never been able to forget the sorrow and the shame of this foreign conquest, physical and cultural: and because deep down in the Persian mind there was this sense of resentment that Persia could express her most profound self in her Sufi poetry and philosophy, which, although opposed to the spirit of the Koran, is one of the greatest things in Islamic culture. Persia could not forget her glorious past even when under the tutelage of Islam; that is why she feels exalted at the mention of her pre-Islamic heroes, Rustam and Darab, Ardeshir Babagan and Shahpuhr, and Nushirvan. At the touch of the magic wand of European culture and European training, the sleeping consciousness of Persia is awake once more, and she is feeling a sort of repugnance for the Arab's language and mentality, and even for the religion that came to her from Arabia. This is clear on all sides. The movement to purify the Persian language by removing its Arabic element (which would appear to be an impossible task now), to substitute the Roman script, or even the Avestan, for the Arabic in which Persian began to be written from after the Arab conquest, the welcome accorded to the Parsis, banished Zoroastrians from Persia, and an increased interest in Zoroastrianism and in ancient Persian history—these are outward symptoms of an inward change. What all this will result in we can only wait and see.

Thus in most lands which have been under the shadow of an alien culture we see a movement for a revived nationalism. The people of Egypt have become Arabized in language and religion, but they are the true descendants of the pyramid builders of ancient Egypt. They have now grown self-conscious once more, as the sons of this oldest people, and are once more studying the history and literature, religion and art of their ancestors: and a modern school of painting and sculpture in Egypt is even seeking inspiration from the deathless creations in art which emanated from ancient Egypt and which form such a valuable heritage of man for his aesthetic, even spiritual exaltation.

The Indian Mussalman similarly is bound to look back sooner or later with pride and affection upon the achievements of his ancient Indian ancestors, upon the heritage which he will learn sooner or later to regard as the fountain-head of the highest mental and spiritual culture, howsoever much he might direct his attention to other lands now: his creed will continue to take a deeper and deeper colouring imaginable from his environment and from his fundamental race-consciousness. The mind of the cultured Indian Mussalman is slowly becoming responsive to all this: the call of Mother India will have its appeal to her Mussalman son, as much as the call of Quetzalcoatl is being listened to by the present-day Christian Mexican. On that auspicious day when the Indian Mussalman will whole-heartedly respond to this call all the miseries of India will end.

NEED OUR SCHOOLS CONTINUE GODLESS ?

By J. M. KUMARAPPA, M. A., PH. D.

PARADOXICAL though it may seem, religion has been and is as much a divisive force as it is a binding factor in the evolution of society. In the name of religion man serves man and in the name of religion man persecutes man ; in the name of religion man loves man, and in the name of religion man hates man. And whenever religious differences happen to coincide, however slightly, with lines of political or racial cleavage, the opposition developed becomes hopelessly implacable and horribly destructive. Hence to avoid religious wars and inhuman persecutions, religion has been made the concern of the individual rather than that of the State. Political evolution therefore has tended naturally towards progressive separation of Church and State. Because of such divorce, the State, which once was supposed to depend on the Church as means of fullest service and control, and which, consequently, fostered religious education in a variety of ways, has gradually eschewed it from the curriculum of public schools in the interest of religious neutrality, and made it over to the tender mercies of religious organizations themselves.

In India also the plea of non-interference in matters of religion has been remarkably successful. In the interest of this principle of neutrality, our Government has so secularized the educational system as to exclude moral instruction completely from public schools. And unfortunately these godless schools have also served as models for numerous founders of private schools. Strange as it may appear, even Christian Mission institutions, which used to give compulsory religious instruction, have sold their religion for 'thirty pieces of silver,' and have accepted for the sake of Government's financial support a purely secular curriculum. Since man is 'incurably religious' in India at least, and since the goal of the entire educative process is moral, it is hard to understand how we have been so far satisfied to receive a purely secular education. Our leaders seem to have been unaware of the fact that at each step in the elimination of religious instruction from public schools, our society was assuming increased risks, since an education which is not religious is unsafe both for the individual and for the State. The business of education, it is maintained, is to develop the physique, train the mind and cultivate the soul. While our institutions have been trying to function, however imperfectly, in the first two directions, they have sadly, but deliberately, been neglecting the cultivation of the pupils' spiritual resources. And the result is that we find modern India in the grip of a frightful inertia, caused partly by political subjection and partly by the domination of irreligion. Our ideals have sunk low ; our character has become weak and our will feeble.

However, we must be thankful for the new national awakening which has made us conscious of our moral deterioration, and of the shortcomings of our present system of education. "The schools, it is felt, (and the criticism is extended to the colleges), fail" says the Calcutta University Commission's Report, "in the formation of character. Put more explicitly this criticism charges the schools with failure to convey to a boy's mind a clear apprehension of an ideal of duty. Pressed further home, the charge amounts to more even than this : it implies that the schools have no spiritual life which touches a boy's inner nature, no corporate unity which appeals to and can sustain his affectionate loyalty, no moral or intellectual flame which may kindle his emotions." Hence "it must be acknowledged," concludes the Report, "the work of the schools as a whole is bleak and barren." In view of this deplorable condition, our educational experts and political leaders now feel that something must be done to save our people from a moral collapse, but they fight shy of making religious instruction a part of the public school

curriculum. They declare, and that not without reason, that our educational institutions should be kept free from sectarian dissension, difference and conflict. But then some solution must be found, and ways and means must be devised, for the building up of character in the future citizens of India.

There is a widespread recognition not only in India but in all progressive countries of the world, that an education which does not rest on a religious foundation is worse than ignorance. History shows that nations have made their education a means for the attainment of the things they value most. As power, learning, piety, skill, wealth and the like, became in turn the object of desire, so the means of securing them became the object of study. Athens, valuing beauty, symmetry and harmony, both physical and intellectual, sought through her great teachers to cultivate a love of the true, the beautiful and the good. Rome, exalting law, authority and conquest, instructed her youth in oratory and military tactics. So also if we really desire sterling character, it must be made an educational objective, and all our schools must be compelled to give moral training to their pupils. England requires moral instruction in her national and church schools on the plea that it is necessary to "maintain her commercial supremacy;" Germany wants it "for the sake of industrial efficiency." And we want it in order to provide our youth with the necessary moral stamina to bear the burdens and responsibilities of a free India.

We must not become discouraged because of the difficulties we are likely to encounter in enforcing religious instruction in public schools. Such difficulties, we must bear in mind, are not peculiar to ourselves. The recent conflict between the Pope and the Premier in Italy was at bottom a question of religious education of the young. Somewhat similar to our own situation is that which obtains in the United States of America. In India we have the Hindu, Muslim, Parsee and Christian communities; besides these there are ever so many smaller groups. Is it possible to satisfy the demands of so many communities? This problem is not dissimilar to that of America where one finds the Jewish, Catholic, Protestant and Mormon communities. Outside of these major communities, there are other sects and sub-sects. How is religious instruction to be given to the representatives of these diverse groups? This is, indeed, a very vexing problem,—a problem which the nation has been facing since its very birth. Nevertheless, some experiments are now being tried in the different parts of the United States. Believing that the morals of a community depend upon its religion, the Interfaith Committees and also other leaders of the different religious groups are making a united effort to surmount the difficulties and devise a satisfactory plan for religious education of the youth of the nation. Since any success attained in this direction cannot but be of value to others in the same position, it may not be out of place to see how America is meeting the situation.

In the United States all the early educational institutions were founded with a distinctly religious bias. This is true not only of such institutions as Harvard, Yale, Princeton, Columbia, Brown and Rutgers but also of most of the private colleges organized later. Many of them serve as organs of particular sects or denominations, and are, therefore, not only authorized but expected to teach the religious doctrine of their founders. They may be likened to our Hindu and Muslim universities in a general way. But when the Federal Government was organized nothing was said about religion in the Constitution itself, but the first amendment made the following provision: "Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof." Similar provisions are found in all the State Constitutions, and most of them prohibit sectarian teaching and influences. In six of the Constitutions the term "religion or religions" is used in addition to the prohibition of sectarianism. "No atheistic, infidel, sectarian, religious or denominational doctrine" reads the statute of the Mormon State of Utah, "shall be taught in any of the district schools of the State." In most cases laws are enacted to cover points not touched by the Constitutions themselves. These laws, like the Constitutions, usually prohibit sectarian influence and propaganda rather than the teaching of religion as such.

Not being satisfied with the situation in public schools, religious America has been trying earnestly for the past few years to find a satisfactory solution to this problem. As a result of the agitation carried on by religious leaders, the Court of Appeal of the State of New York, rendered a decision in May, 1927, to the effect that for an hour a week children may be lawfully permitted, upon the request of their parents, to attend religious instruction in such centres outside of school as parents shall designate. Similarly some of the other States are trying to solve the problem of religious education by special provision. In Minneapolis, for instance, an experiment was started about eight years ago ; and this experiment, by keeping the traditional separation of the State and the Church complete and intact, has succeeded in avoiding the bitter controversies that usually arise when efforts are made to introduce religious instruction in public schools. According to the Minneapolis scheme, the classes of religious education for all Protestant denominations,—which are not a few,—are organized under the auspices of the Minneapolis Church Federation, a group combining most of the Protestant Churches of the city. In addition to this, the Catholics and the Christian Scientists have established their own classes, each being entirely separate from the Federation. So also the Jews conduct their classes independently of the Federation.

This scheme makes it quite evident that the real responsibility of religious education is borne by religious organizations, not by public schools. What then, one may ask, is the part of the public school in this plan of religious education ? Its part is only to release its pupils at the appointed time from other work so as to enable them to attend their classes of religious instruction. To this end the State law had to be amended, vesting such powers on the head master or the principal. Since the new law requires that the classes of religious education be maintained in some place outside the public school building, these classes are held in the church nearest to the school, and never more than two furlongs distant. Thus the children to whom religious instruction is imparted are at that time entirely outside the public school premises. And these special classes for moral training have come to be designated as the school of religious education. Further, the law requires the child's parent or guardian to send in an application requesting that the child be allowed to undergo religious training. Though the number of hours for which the child could be excused for such instruction is three a week, yet only one hour is being utilized at present.

In this experiment one finds four fundamental principles in operation. The first one is that classes in religious instruction should be held outside the public school building. No member of the school staff is allowed to have any connection whatever with it. The second principle is that the attendance of pupils should be optional and subject to the parents' approval. Incidentally it may be mentioned that there is also a rule that unless 50 per cent of the Protestant children in the district desire the school of religious education, it should not be established. The third principle, and an important one, is that such a school should be staffed with teachers highly qualified in religious education. From the beginning the advocates of schools for religious education realized that to make such schools effective, they must be supplied with teaching of a quality at least as high as that in public schools. A teacher, for instance, in the Minneapolis school of religious education is required to have, besides the normal school training, a minimum of three years' experience in public school teaching and a minimum of two years' Church school or Sunday school teaching. Moreover, he or she must also meet the scholastic requirements of having specialized in religious education, mental hygiene and supervision of education. Above all these, the teacher is required to pass stringent tests of character and personality, the latter including a knowledge of child nature, tact in handling children, appearance, health and so forth. The last principle is that the teaching content should be non-sectarian, but based on general spiritual needs.

The main aim of the school of religious education is to give religion its legitimate place in the life of the child, and to aid in developing in the pupil high ideals of character and citizenship. Classroom work consists in

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

the salutation of the flag, (the love of the country is not overlooked while teaching the love of God), memorizing select passages from the Bible, discussions on the problems of morality, methods of worship and the development of personal habits. A large amount of the material for instruction is drawn from the Bible, while the life of Christ is made the supreme example in the adventure of living a full life. The Minneapolis experiment is considered a great success, and after eight years' trial, it has now become an established institution in the life of the community. The enrolment of pupils in this school of religious education has increased to such an extent that new plans are now under way for its extension. During this short period of its existence, the school has succeeded in a remarkable way not only in raising the moral tone of the districts but in promoting a feeling of co-operation and goodwill among the different communities. Would it not be possible for our political leaders and educational experts to work out a similar scheme for the religious education of our boys and girls? The children of today make the State of tomorrow. In view of all the changes that are taking place now in our political and social life, I believe this aspect of the education of Indian youth ought not to be neglected.

Some maintain that religious training is not the concern of the school. This, they say, is the business of the home. There is, of course, no question about the value of home training, provided the home is an ideal one and the parents are not only alive to their obligation to give such training but are capable of discharging such duties. Unfortunately, owing to a century or more of social, economic and cultural changes, there has come a moral deterioration in the home also, so much so, that parents themselves are now in need of such instruction. How then can we shift the entire responsibility of character training to the home? Further, it must be noted that there is a strong tendency on the part of our people to separate religion and morality. To many religion seems to mean only ritual; whereas in the point of view maintained in this article, religion and morality are inseparably connected. The function of the school of religious education then must be not to train the pupils in rituals and dogmas but to build character. It must seek not merely to supply the intellect with moral standards and ideals, but to train the will to choose aright. The education of the will is the supreme aim of moral instruction, and this type of training certainly cannot be undertaken by the average parent of today.

Unfortunately, even our present school life, as the child finds it, is too forced and artificial. It is not real and the child knows it. The material with which the school deals is far remote from the child's natural interests. He fails to see its connection with the hard facts of everyday living. Naturally therefore he does not take his school life as seriously as he does his life outside the school. To make matters worse, even the point of contact between teacher and pupil is intellectual and academic rather than personal and inspirational. Not only the environment of the school but even the content of his studies and the moral standards of the school appear to him as merely academic. This rather negative condition of our school life can be overcome; we need only to enrich the curriculum and vitalize the activities of the school by an infusion of the warm currents of the child's every-day interests and experiences outside the school. Unless we are able to do this, we must content ourselves with merely skimming the ground of moral training in the education of our youth.

Religious education is always a means not only of furthering each type of faith but even more of making its social application effective. Social stability, altruistic service and moral temperance must begin with the character training of children. It is true that the religious demands even now do give room to controversy, persecution and proselytization. But because of that, shall we ignore the most important phase of a child's education? What we must rather do is to break away from the obstructing traditions and try, as Prof. John Dewey says, to reach "that type of religion which will be the fine flower of the modern spirit's achievement. Perhaps a fully developed but non-sectarian programme of social education in our public schools may succeed in promoting widespread respect in youth for the social values of all religions.

Perhaps the gradual acceptance of certain basic principles of social evolution will help our people to understand that the religious life,—beliefs, rituals, institutions and the like,—must perpetually change as knowledge expands and men's group relationship widens. The social education process of public schools need not necessarily include religious teaching, much less religious propaganda. They may well include and objective and dispassionate study of the social values of all religions, and the promotion and respect for all as among the achievements of human effort.

The problem of moral training is primarily a phase of the larger problem of social education. Apart from participation in social life, the principles and precepts of ethics have no significance. Formal instruction in morals is good, so far as it goes, but unfortunately it does not go far enough. Formal instruction often gives the pupil only an intellectual recognition of the principles of conduct, and that is why mere knowledge of what is right does not make a person do the right. Such education, therefore, must be supplemented by opportunities for practice. Hence social life of the school must be natural and as nearly as possible a reproduction of the healthiest social life of the community. The present artificiality of the school atmosphere is an outcome of the tendeney of the school, as an institution, to develop a life of its own which becomes more or less independent of the society it serves. This tendency of the school to become artificial and isolated from the life of the people must be checked. A more widespread conception of the school as a social institution, a medium of social conservation and regeneration, must displace the all too common and narrow idea of its function as that of merely imparting a little formal knowledge. To provide adequate and definite instruction in right living; to provide inspiration and the necessary stimulus to choose the right, and to perfect the will by giving opportunities for the execution of right desires: these are pre-eminently the functions of the school. To neglect the instruction and training of the child in right living is to deprive him of his best and highest birth-right.

PSYCHOLOGY OF FEMININENESS IN RELATION TO THE GANDHI MOVEMENT

By SURENDRANATH BOSE.

Introduction

WAR, on the whole, is the destruction of the weaker by the stronger. Its abolition can be achieved by the exertions of an opposite power whose function is to protect the weaker against the stronger. There is such a power in Nature: it resides in the heart of woman. The woman secretes milk in her breast to save the more feeble than herself from death; this is a natural feminine function which points to the fact that she enshrines also a feeling in her breast which will save "man's feeble race" from the horrors of war if she could mother the race.

The present essay aims to suggest a method by which feminine power may develop into a Matriarchy which will ultimately lead to the abolition of war.

Femininеness

Femininеness does not mean the same thing as effeminacy. Effeminacy means the desire to be protected and supported by others. Such a state of mind may come to persons of both sexes, though it has become normal to women on account of circumstances imposed upon them by men. Among the lower animals, there is no effeminacy, but there is femininеness.

Femininеness belongs to the female only. It is in the womb of the female that the child is conceived and lives for a period of several months, and it is on her milk that it feeds and grows. In the matter of reproducing a new life clothed with her own flesh and blood and nourished with her own milk, the female acquires experiences and feelings of which her male companion can know nothing. This province of

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

female mentality which is unknown to the male constitutes the femininenes of the female, and contains psychic forces of inestimable value to the race.

Femininenes and War

Femininenes contains an element of psychic force which can abolish war.

War is the destruction of the weaker by the stronger. Its abolition can be effected only by a power which is of an opposite nature, that is, by a power whose function is the protection of the weaker against the stronger. Such a power exists in the femininenes of the woman.

Woman secretes milk in her breast to preserve the life of the weaker than herself. This is a natural biological function in her. A natural function is, in all cases, accompanied by an instinctive genius which is appropriate to that function. Woman's natural function, just spoken of, shows that she possesses a genius which knows how to protect the weaker against the stronger.

The protection of the weaker against the stronger is called humanity. It is opposed to brutality, which is the instinct of the stronger to prey upon the weaker. It is humanity which has evolved the human society with its various civilizations and laws, which all aim at the protection of weakness agaist harms.

Civilization owes its origin to the humanity of the woman. The rise of civilization began in those days of the primitive times when women disengaged themselves from destructive kinds of work, such as hunting, fighting and plundering, and, leaving these to the men, settled down to the invention and performance of constructive kinds of work,—which were suggested to them by their humane feelings for the offspring,—such as spinning, weaving, basketry, pottery, cookery, midwifery, herbal-doctoring, dairy-keeping, child-nursing and the like. (Briffault: *The Mothers*).

War is an evolution of brutality and a reversion to barbarism. A few months of war may undo all that has been gained by centuries of humanism and civilization.

A certain amount of cruelty,—a capacity for resisting and killing an attacker,—must be natural to woman; for she has to save her offspring from enemies who surround it. The occasional cruelty of woman is not warlike; it is a protest against the warlike spirit. Wars and fights of woman mostly arise from motives of protecting the weaker or the peaceloving against the stronger or the warlike, as shown in the legends of mythology. Although she is naturally so weak and timid, yet to protect the weaker creature, woman can openly attack enemies a hundred times stronger than herself. In the majority of cases, women have participated in war, and shown heroism, to alleviate the sufferings of its victims. The unselfish character of woman's humanity is shown by the fact that a mother rebukes her own child when she finds it molesting some weaker creature, as for example, the young of a bird's nest. "Woman does not feel gratified for the honour done to her son for killing some other woman's babies." (Bernard Shaw: *The Intelligent Woman's Guide*).

While femininenes is characterized by cruelty to the attacker, the martial spirit is characterized by cruelty to the defender. In fact, the fury of an attack in warfare is proportioned to the obstinacy of the defence. It is the same thing as the ferocity of the beasts of prey, which is incensed tenfold at the victim's attempt to escape.

Femininenes, being opposed to war in so many respects, must have a power which can contribute to the abolition of war from human society.

Femininenes and Peace

Femininenes contains an element of psychic force which can organize peace.

To attain peace an economical organization of society is necessary, such as will make provision for the unprovided. Men go to enlist as soldiers because they cannot find provision for themselves in the economical organization of society.

The secretion of milk in woman is, as has been said before, a natural biological function in her. This enables her to make provision for the unprovided. Corresponding to this functional activity there exists in woman a genius for economy. It is a fact that the administration of most of the family income has belonged to the occupation of wife and mother, who has shown in it better economic capacity than men. The maternal instincts which created the Motherhood formed by the mother and her offspring, are the original forces which gave rise to the home and domestic economy, and thence organized the state with its political economy. (Cf. Bernard Shaw: *The Intelligent Woman's Guide*; Briffault: *The Mothers*).

The indifference of women to the problems of social economy is due partly to the present system of education which denies them all knowledge of economics but chiefly to the existing organization of the State, which does not make provisions for their children, so that every mother has to provide for her own child against the State. Yet it is a significant fact that women are more inclined to share their provisions among themselves than to snatch provisions from one another.

Social economy aims at the fitting of as many as possible to survive. War upsets the social economy and substitutes for it the opposite condition of struggle for existence and survival of the fittest.

Femininenes being thus the orginator of the peaceful condition of the home, must have a power which can contribute to the organization of peace in human society.

Children snatched from their mothers' breasts and dashed to death by invading soldiers

Femininеness and Unity

Femininеness contains an element of psychic force which can establish unity

Speaking generally, differences among men arise from their want of mutual understanding, while their unity arises from mutual understanding. Thus greater unity is possible among men who speak or understand the same language than among those whose speeches are unintelligible to one another. But apart from spoken language there is an unspoken language by which mutual understanding is possible even among peoples of outlandish tongues, namely, sympathy, the language of the heart.

Sympathy is innate in the female mind; it is the feeling of the mother. Miss Florence Nightingale and her army have shown that even childless womanhood is clothed with all the sympathetic feelings of the mother. The existence of the same feelings in a baby girl is betrayed by her affection for her doll. Woman is a born mother.

Made by Nature to bear a stranger within her, woman is naturally more sympathetic to a stranger, and understands the needs of a stranger better, than man. The history of primitive societies shows that "it is the woman who faces the stranger"; that even where the status of women is one of subjection, "it is nevertheless the woman who naturally takes the lead in negotiations with strangers." In modern society, the General Federation of Women's Clubs includes among its aims and objects "a better understanding of international relations." (Briffault: *The Mothers*; Encyclopaedia Britannica: *Art., Woman.*)

International unity will come from women of the future society. Femininеness is the guardian of that wisdom which prevents fights among children and maintains unity among them. It will be the guardian of that wisdom which will prevent wars among nations and maintain unity among them when it will be in a position to mother the race in addition to mothering babies. Obviously, the capability of maintaining unity among children argues the possession of a faculty for maintaining unity among nations.

Femininеness, being thus gifted with sympathy for strangers, must have a power which can contribute to the establishment of unity among the nations of mankind, which are still strangers to one another.

Feminine Division of Labour and The Rise of Matriarchy as The Power Antagonistic to War

The mere fact that femininess is opposed to war cannot abolish war. Femininess exists among the beasts also. With a view to abolish war, it is necessary to educate and employ the feminine genius in such a way that it may not only create a peace propaganda which may be more powerful than the military propaganda but also give the challenge to war. There must be a system of training the women for this great task.

Further, when women have been given the proper education and employment, they must be given also the proper opportunity to create international institutions by which the feeble and abortive efforts of individual mothers will be consolidated or replaced by powerful and co-ordinated social activities on the part of the community at large. Without such co-operating organizations, even the noblest efforts of the most devoted mother could not save her child from the ever-threatening storms of war.

The institution of co-operating international organizations of women will evolve Matriarchy or a body-politic of mothers, which will become an integral part of the state government. But this requires that women should first be made economically independent of men.

Hitherto women, being systematically kept under subjection to men, could not presume to think of their economic independence. The emancipation of women has now thrown open the paths of independence to their vision. It has created a sex rivalry in which women are competing with men in all the spheres of activity. In this way women might enter into military affairs and discover ways to bring all wars of bloodshed to an end. But it is to be feared that, apart from the as yet undecided question of impairment of women's femininess by their doing of masculine kinds of work, women will hardly be able to maintain their economic independence of men by sheer competition with them; for women suffer from natural impediments which will give the advantage to men. Hence a method must be devised by which women will get adequate opportunities to become economically independent of men without competing with them. It has already been found that the state can make it practicable for women to work without prohibiting or preventing maternity. (Havelock Ellis: *The Family*).

If legislation may take account of women's *physical* make-up and secure the social interest in a healthy womanhood by imposing, as it does, restrictions affecting industrial employment which apply to women only, then it may equally take account of women's *psychical* make-up and secure the wider interest in a powerful motherhood by making a division of labour for women with respect to certain spheres of activity provided with restrictions which apply to men only.

The possession by women of a special feminine province of mind unknowable to men has enabled them in the past to dissociate their activities from those of men and lay the foundation of peace in the home; the same qualification entitles them now to specialize in certain spheres of activity with a view to lay the foundation of peace in the world.

Without doubt, since men and women are different, there will be certain kinds of work for which men and women will respectively be better or less well-adapted. Division of labour is, in fact, of sexual origin; it originated in the family with the specialization of duties between man and woman. Undoubtedly, division of labour between the two natural divisions of mankind, namely, the two sexes, is more reasonable than the existing division of labour among several fictitious divisions of mankind such as the castes or orders of society. At all events, it is unfair to allot all remunerative labour to one sex and make the other sex dependent on the former's earnings. Civilization without a feminine division of labour is an organized insult to womankind. (Royden: *Women and the Sovereign State*; Dow: *Society and its Problems*; Samson: *The New Humanism*).

Division of labour does not much exist among the lower animals, and, without it, man also would have remained at the merely animal level. It was division of labour which made the barbarians civilized. The progress of culture is everywhere marked by growing refinements in division of labour. An improvement in division of labour, founded on biological facts of sex, will facilitate the attainment of a higher state of civilization and culture. (*Cf.* Adam Smith: *The Wealth of Nations*; Walker: *Political Economy*; Marshall: *Economics of Industry*; Ogburn: *The Social Sciences*; Mackenzie: *Introduction to Social Philosophy*; Samson: *The New Humanism*).

As to what are the feminine occupations which should be reserved for women, this is a question of detail; what is important is the principle. There are great statesmen and expert administrators, with strong common sense and deep insight into the feelings of others, to whom the work of determining the feminine division of labour might be safely entrusted. It may be remarked in this connection that although, in these modern times, spinsters cannot be expected to replace the spinning machines nor daughters to go back to their dairies, yet the value of old traditions in effecting a reformation peacefully should not be under-estimated. The International Matriarchy Act may be best begun by restoring to women the industries of which they were the originators. This may be the beginning of a League of Mothers to enforce peace among the nations.

Sex-Division of work and wages will bring to

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

women their real economic independence of men. Out of the economic independence of women will arise those co-operating international organizations which will evolve Matriarchy, as said above. A fully developed, genuine Matriarchy, which is quite different from mere Matrilinealism or Gynæcocracy or Queendom, has not yet been established on earth. (*Cf.* Dow: *Society and its Problems*; Lowie: *Primitive Society*.) Once it has been established in these modern days, its progress will not take a long time to bring it into collision with Militarism and the propaganda of war.

Whether women's war against militarism will be one of bloodshed or not, is a question which remains unanswered. The Aryans propagated a symbol of worship in which Ten Hands from among the mothers are incorporated into a Matriarchal body called Durga or the inviolable) which has engaged the State-lion (that is, the Patriarchal Power) to assist in the bloody war of destroying the Devil of militarism and initiating a new era of peace in which Angels visit the earth.

Matriarchy and the Future of Society

It is evident that Matriarchy will seek to remove all causes of crimes and wars.

Crimes and wars can be abolished, but not the spirit which prompts men to them,—the daring and enterprising spirit. Peace is only a transformation of that spirit from the destructive to the constructive form.

While physical daring has been required in the exploits of war, moral courage will be required in the achievements of peace. The work of peace will be an unending increase of progressive reformation and culture. By reformation is meant the conquest of Nature by man; while culture means the acquisition of newer and newer mental powers which can more and more understand the laws and conquer the forces of Nature. The aid of Matriarchy will be particularly valuable in the work of peace. For women will strike out according to their natural peace-loving inclinations and,—with the practical sense, attention to minutæ and precision of work characteristic of the sex,—cultivate fields that men would never have cultivated. "They will thus add to the world's progress." (*Cf.* Ward: *Applied Sociology*). Hitherto, all attempts at reformation and culture have been systematically arrested by the opposition of the masses of uneducated, ignorant and superstitious women; Matriarchy will lift them from the quagmire of superstition, and then they will learn to pay more attention to the heaven and hell of this world than to those of the other world.

The individual has known peace and security in the lap of the mother; the race will find peace and security in the lap of Matriarchy.

Reformation

Without an efficient Matriarchy the emancipation of woman has meant the offering of females as sexual prey to males and of males as financial prey to females. It is a matter of necessity that in order to make men her financial prey without herself becoming their sexual prey, woman will be scheming and practising infinite deceit upon men. No question of feminine frailty or deceitfulness arises in connection with females who are economically independent of males, as among the primitive folks and lower animals.

Matriarchy will mean the suppression and reformation of those among men and women who would choose to be dissipators or temptresses; *it will mean the removal of all real or supposed objections to the emancipation of woman.* The criminal reformation of the future will proceed on a psychopathological basis.

Crimes and wars are due to the interaction of two things, namely, weakness and brutality. With the progress of Matriarchal legislation, weakness will be armed with strength while brutality will be suppressed; for humanity, or the protection of the weak against the strong, is the natural disposition and guiding principle of the motherkind, as has been said above. The crafts which profit by war and therefore promote the causes of war will lose their jobs and become extinct.

The expansive force of overpopulation carries with it a state of war. The regulation of population will be possible only through the co-operation of Matriarchy with the State. Restriction of the increase of population is not a greater evil than massacre of a surplus population. (Bernard Shaw: *Woman's Guide*).

But the chief thing which furnishes causes of crimes and wars is property. The State, at present, plays the game of throwing money before its subjects and making them fight or scramble among themselves for their portions as best they could. To this scramble for money is due the rise and growth of private property and, consequently, of crimes and wars. Generally speaking, crime of this character is a transfer of property from individual to individual, while war is a transfer of property from nation to nation.

It would not be unreasonable to expect that Matriarchy, with its motherly principles of the protection of the unprotected, provision for the unprovided, and unity among the un-united, will check all harmful systems which promote competition, exploitation and rivalry, and direct its attention to utilize each and all of the members of society for the benefit of the whole organization, and eventually make State-provisions take the place of private property, thus making the peoples co-operate with the State for the peace of society. It is possible to do this even now while retaining the monarchies and republics, and improving the machineries and factories (Cf.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

A. R. Wallace: *Studies*; Marvin: *Science and Civilization*; Bertrand Russell: *Social Reconstruction.*)

To abolish war internationalism is necessary. So long as nations remain strangers to one another, they will be enemies and wars will continue on account of their mutual distrust and fears. A great longing for a secure condition of international life based upon reciprocity is filling the world which is today seeking for an organizer. "There can be no question that men and women would prefer at present to get mates away from home, even if there were no traditional prejudice against the marriage of near kin." (Rousseau: *Perpetual Peace*; Ludwig: *War and Peace*; Fried: *German Emperor and the Peace of the World*; Thomas: *Sex and Society*).

It is evident that communities among which a perpetual marriage contract is established will tend to become one people and dwell together, The future progress of man may depend on the establishment of a type out of the fusion of existing types. "The source of every civilization has lain in race-mixture." Youthful nations are those which owe their origin to the intermixture of several old and effete nations. "Intermarriage produces a marked effect in the richness of brain power',' if biological laws are properly attended to. On the other hand, unmixed, aboriginal nations tend to remain in a state of arrested development. It is a fact that cross-breading between different species gives bad results but between varieties of the same species gives good results. (Briffault: *The Mothers*; Petric: *The Revolutions of Civilization*; Galton: *Essays in Eugenics*; Newman: *Evolution, Genetics and Eugenics*; Muller: *Sexual Biology*).

Women are eminently fitted for the work of establishing international reciprocity and unity, since their sense of economy and their sympathy for strangers are greater than man's, as has been said above. The evolution of a higher race from the amalgamation of nations will be accomplished when Matriarchy has been established and not before.

In the cult of Matriarchy there is a bond of unity between nations which are professedly opposed to each other. While the Moslem says, "Heaven lies beneath the feet of the mother," the Hindu responds, "The mother is higher than heaven."

With the progress of Matriarchy and humane civilization, science will be rescued from its barbaric misuses and will be "used to increase the sum of human happiness." A new moral order will arise which will stabilize "a marriage contract of far greater stringency than that recognized today." It was primitive Matriarchy which, even in its undeveloped state, evolved monogamy and "developed into the highest standards of marriage." (H. G. Wells: *Socialism and the Family*; Count Keyserling: *The Book of Marriage*).

Religion will derive a new source of inspiration from Matriarchy; for a subtle relation exists between the two. Devotees of religion show a tendency to hide themselves in small rooms or caves; some even assume the postures of the embryonic child. Psycho-analytically, this is a return to the security of the mother's womb in quest of peace. (Cf. Stoddart: *Mind and its Disorders*). And mothers are more inclined than fathers to support their religiously minded children.

The human endeavour to come in contact with the eternal world might achieve some practical results under the auspices of Matriarchy, which will be the glorious future of humanity. Asceticism and Astrology will be purified of their superstitious taints and placed on reformed and well-founded bases.

Culture

The underlying principle of all reforms is culture. By culture is meant the creation of a new mind by social operations.

It has been said of culturists that "they invent a social order without respect to the human heart, and then they invent a human heart to suit their social order." (Towler and Ray: *Socialism*). But it is the creation of a new mind to which the forces of biological evolution are always addressing themselves. Civilization, in some of its phases, is nothing but a continuous process of renovating the mind of man.

The modern social mind is a creation of Militarism. So long as it lasts the love of peace will be considered to be a sign of inferiority. Militarism will sink into odium when the arising of a new mind will take place which will regard the ideal of peace not only as higher than the ideal of war but as the proper object of man's desire. So long as the warlike mind does not give place to the peace-loving mind, mere disarmament of nations cannot abolish war; for men can fight with their fists and teeth.

This new mind will be a creation of Matriarchy;—it is contingent upon the education of the race at the hands of the cultured and independent mothers of the future. Only the dignified mothers of the future will be able to impart to their sons a burning hatred of the degradation of the soul which is forced upon mankind by war,—war with its horrible passion for violence and destruction, "with its devasted fields and ruined cities, with its millions of dead and more millions of maimed and wounded, its broken-hearted and defiled women and its starved children bereft of their natural protection, its hate and atmosphere of lies and intrigue, its outrage on all that is human, its mowed-down masses of men, including the aged and the infirm, women and children;—and to make their girls understand that they are the natural guardians of life and hearth, that they may arise and extinguish a fever-fit of humanity

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

before it bursts into war, that "theirs are those weaponless hands which, since primaeval times, have been superior to hands bearing arms". (Cf. Kidd : *The Science of Power* : Ellen Key: *The Younger Generation* ; Ludwig ; *War and Peace* ; Harrison : *Natural and Social Problems ;* Sir S. Radhakrishnan : *Kalki, or the Future of Civilization*).

When peace will become the ideal of men, women will be given the palm of superiority to men. In fact, woman represents a superior type of mind—which the civilized man is only slowly approaching. The great uplifters of mankind possessed not only feminine type of mind but also feminine type of the countenance. Religion inculcates feminine virtues as higher than masculine ones. The militarist unconsciously admits the same fact in his conception of Angels as superior to Devils. (Cf. Bogardus: *Introduction to Social Sciences*).

Upon women falls the task not only of throwing off their own subjection, but of rescuing from the like thraldom the deepest realities of their femininenes upon which society was originally founded by them. To beat down Satan under foot and make the earth habitable for the saints is a work which God has reserved for Matriarchy and not for Militarism. "The beautiful legend will yet come true; Ormuzd will vanquish Ahriman; Satan will be overcome; Virtue will descend from heaven surrounded by her Angels and reign over the hearts of men. Women will become the companions of men, and the tutors of their children. Immortality will be invented." Men will conquer Time and Space; and they will migrate to the stars and inhabit them. (Winwood Reade: *The Martyrdom of Man*).

It is evident that when women will become educated and wealthy, they will turn their attention to the promotion of culture; and then will Learning be rescued from the curse of indigence which has so long attached to it. It has been truly said that "Matriarchy evolves the creative genius of man." (Count Keyserling *The Book of Marriage*).

Conclusion

Matriarchy seems to be imminent. A sex-war is manifesting its approach in the way that women are leaving housework to take up public services, and ceasing to care whether they lose man's respect or not. "Round the woman question in its largest sense one of the next great fights will centre." (Havelock Ellis: *Women and Socialism*).

The great sex-war of the future will be a contest between humanity and brutality as to which is the more powerful force of nature and which is to have the mastery of the world. The criterion of power is the ability to compel others against their will. Woman exercises compulsion not by violent physical force but by non-violent psychical influences. In the fight of the sexes, the total abolition of war would, of course, be the ideal, and weapons will be of little use. Women will carry their day by strikes, disobediences, and martyrdoms invented by themselves when Matriarchal unions have been formed by them. Mothers will not talk piously but will go "the whole hog against war;" they will refuse to bear sacrificial offsprings to the State. (Agnes Dollan; Bernard Shaw). Society being thus threatened with extinction, the State will be compelled to come to terms with the mothers and break with the past: the triumph of Matriarchy will then be an accomplished fact.

The triumph of women over men will be the triumph of humanity over brutality, of the forces of mind over the forces of matter. It will form a new chapter in the history of animal magnetism,—a chapter which was scarcely thought of before, namely, the conquest of Militarism by Femininenes. Upon that vast inquiry concerning the influence of mind over matter—an inquiry which the embodied mind of man will never be able to fathom completely—it will shed a new light. It will afford an additional proof of the strength of the unconquerable mind and the weakness of matter as compared with it;—another illustration of the words of the inspired Psalmist that we are "fearfully and wonderfully" made.

The power of femininenes is closely allied to the original Energy which has evolved the universe out of the womb of chaos and woven it into an orderly system;—the Shakti of ancient Aryan philosophy and religion.

The overcoming of brutal forces by psychical influences is the spirit of the recent Gandhi Movement in India. The feminine spirit of the movement is apparent in its advocacy of peaceful culture and feminine kinds of work, its success in bringing women to the front, its espousing the cause of the weak and depressed classes of society, its endeavours to overcome the war of violence by non-violent measures, its preference of martyrdom to persecution, and its inclination to international federation and peace.

To those who have gone through the preceding pages it will be apparent that the present movement in India is founded on principles which are likely to prevail in the near future. Matriarchy, although it may not be without its evil, is yet the true line of future advance and is destined to come with the progress of social evolution.

A PLANET AND A STAR

By NAGENDRANATH GUPTA

'THAT is true of this world also and it is undoubtedly a good sign. It is not possible for all men to renounce the world. Such a call comes to only a few of us and has to be obeyed, but for the great majority the ways of the world must be sufficient and they cannot turn away from it. But if men live better lives and pursue higher ideals than they did in former times it is a great gain. The ultimate goal, however, must always remain the same, and that is the emancipation of the spirit from the thrall of life and death. To compass this consummation no help can come from outside. It is by dint of our own individual efforts that we can win to final release when all our trammels are broken and we attain eternal peace. There is always the haunting sense that we are at one with the Infinite; this explains why we feel that we are really immortal, in spite of our all too mortal abode of flesh. There is neither heaven nor hell nor any law of reward or punishment. But we are born again and again and our happiness or our suffering is in our own hands.'

Maruchi said, 'The belief in heaven and hell is very ancient and almost all the ancient sacred books speak of them. But it is now generally understood that heaven and hell are creations of human imagination.'

'There can be no question about it. First, there is the firm belief that death does not mean the end of the soul which is imperishable. This is quite true. And then arises the confusion about the life hereafter. Our present life is supposed to be based upon a system of rewards and punishments and this theory is carried to the life beyond this life. The conception of heaven and hell is manifestly wrong because it is based upon the senses. Paradise is either a place of a continuous round of pleasures without surfeit or of enjoyment of some other kind. When a dear one dies the survivors say that they hope to meet him or her in heaven. The ties of relationship or love are carried to the next life. Heaven is thus nothing more than another world, much better than this life, where we are all happy and free from the little worries of this life. Hell, on the other hand, is the place where sinners and the wicked are sent and they are tortured and punished far more frightfully than in the land of the living. The foundations in both instances are the same. They are pleasure and punishment based upon the senses. These are physical organs and both pleasure and pain have to be sensed. At death the body which possesses the senses, quickened by the vitality within, perishes. Who then enjoys the pleasures of heaven or suffers the horrors of hell? Either the disembodied spirit or the spirit in another garb of flesh. The latter theory is not seriously maintained in any religion and it was never believed that men and women again became creatures of flesh and blood when they went to heaven or hell. As regards the soul, or the immortal part of man, it can know neither pain nor pleasure since it is no part of the physical organism of man. The conception of heaven and hell is based upon the idea that man retains his physical nature even after death and this is obviously wrong. Further, the notion of reward or punishment in an existence after death can be neither an encouragement nor a deterrent in this life. We may, therefore, dismiss the myth about a heaven and a hell as unreal and imagined from a fixed idea that our senses are part of our immortal self and our susceptibility to pain and pleasure pursues us even after the dissolution of our bodies. There are no angels to welcome us in heaven, nor any fiends to torture us in hell. What we do carry with us is the weight of our own actions, and the burden grows heavier or lighter in each successive life according as we add to it or shed it.'

'The belief in heaven and hell is a very old one, though it is now generally understood that there is no reality behind it. When people speak of God they point upward and imagine that He dwells in a kingdom of His own somewhere high up in the heavens just as we live on the earth and you on Heperon. Hell they locate downwards, either in the womb of the earth, or some other region still further below. But in reality there are no such directions as up or down, and these merely indicate the relative positions of our heads and feet. We came up from the Earth and down on this planet without any change in the direction of our movement.'

'Perfectly true, my children. And now the words of parting have to be spoken. We are so constituted that it must ever be a meeting and a parting. It is strange beyond words that we, the beings of two worlds, should meet, but it is not strange that we have to part, for the parting must come either in life or in death. Who can tell whether we shall meet in another life and whether the memory of this life will abide with us? You will return to your own land in perfect safety and you will be as gods among your own people. Besides, the memory of what you have seen you will carry with you a

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

living evidence of your visit. I wish it were otherwise, but events will take their own course and no one has either the right or the power to interfere.'

These mysterious words made us look at one another in astonishment. What did the Master mean? What could be a living evidence of our visit? We had not thought of taking a bird or animal with us, being very uncertain whether it could live during the long voyage, and we certainly had no idea of asking any human being to accompany us since it meant exile for life.

Maruchi ventured to ask, 'What are we to understand my Master, by a living evidence?'

The Master looked very grave, 'My son, you will understand when the time comes. At present I can say no more.'

We wondered. I looked at the Master and I looked at Orlon and I again wondered.

The next morning we bade farewell to Ashan and his disciples. The Master gave us his blessing and we fell at his feet before parting. I can remember him now, a great and imposing figure, calm-eyed and tranquil of countenance, holding up his right hand in a final benediction as we left the ground and sailed out of sight.

XXXIX

The Return

For some time we spoke of Ashan the Master, his wisdom and the wonders we had seen. He had denied the possession of miraculous powers, but by what other name could we designate what we had witnessed with our own eyes and what we had felt ourselves when under the influence of his power? What we had seen him doing was accomplished without the slightest effort and we were convinced that he had no intention of impressing or bewildering us. He had given an explanation of the powers he possessed, but we could not understand it because we knew nothing of the subtler and deeper potentialities of the spiritual part of man. The miracles recorded in ancient times and attributed to great teachers and prophets were looked upon as inexplicable or evidence of human credulity. What we had seen was certainly beyond our understanding, but there was no question of an easy belief. We were under no delusion, nor did we suspect for a moment that any attempt had been made to impose upon our belief. A suggestion of this kind would have been an insult to our intelligence and a much deeper affront to a man the like of whom we had never seen and might never again meet. There was such distinction in his bearing, so clear was the stamp of truth on his face, so holy was his life that no one could look upon him without a feeling of profound reverence. Had we ever heard another man speak as he did? He was engaged on a quest that appears meaningless to most men, but we had ourselves felt how great and how noble the quest was.

That parting observation of the Master was still puzzling us. Maruchi knitted his eye-brows and put us the question, 'What did the Master mean by a living evidence of our visit? It can scarcely be a wild creature or a domesticated animal, and there is no likelihood of an inhabitant of Mars accompanying us to the planet whence we come.'

Ganimet scratched his head and remarked, 'It may be a Pompo or some one from the City of the Kings.'

Maruchi shook his head. 'That's absurd. We shall see nothing more of the City of the Kings nor are we likely to meet another Pompo. Nevertheless, I feel that what the Master has foreseen is certain to happen. If it is to be a man why did the Master not tell us who it would be?'

'It may be some one we have never met,' I suggested.

'That also is out of the question. Why should any one who has never met us accompany us on a voyage from which it is almost certain that he will never return?'

'What strikes me,' I said, 'is that the Master has given us part of some information, but has withheld part of it. It almost seems as if his object was to mystify us. But he is incapable of it. I have no doubt that he had in mind some one we know, but he did not mention any name because he thought we might be greatly shocked and astonished. At the same time, he wanted us to be prepared for the surprise in store for us.'

'It must be as you say,' remarked Maruchi, 'but what perplexes me is that we have no intention of visiting any place except Opi, and that is merely in fulfilment of a promise to bid good-bye to the monks who were so kind to us. Surely, we do not expect that any one from Opi will be our fellow-traveller to earth. Neither this world nor our own has any attraction for the holy men at Opi.'

Orlon had been listening to us in silence. His face was thoughtful but at times a sudden light came into his eyes and again passed like a flash of distant lightning on the horizon. He now joined the conversation, speaking in a slow, meditative voice, 'It may be that some one will volunteer to go with us, some one who may or may not be known to us.'

'But who can it be?'

'If we knew that all speculation would be at an end.'

The conversation then flagged and we watched the flight of our airship. Before leaving Ashan's hermitage we had consulted the maps in our possession. These did not indicate the site of the hermitage, but Raba was clearly shown and we had made a mark locating the cave retreat of the Master. As we did not intend to visit any

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

other place on the way back it was not necessary to follow the circuitous passage round the various places we had seen on our way to Raba. We were now flying in a straight line towards Opi and much of the country over which we were passing was new to us and we noted numerous towns and large villages in the course of our swift flight. At certain places the country was mountainous and there were large regions of forest. We passed over beautiful lakes with their placid waters mirroring the trees and the hills surrounding them. There were landscapes of pastoral beauty which we passed much too quickly to be able to admire them fully. Moreover, our thoughts were occupied more with the future than with the present. Now that we had decided to bring our visit to Mars to an end we were thinking of the long voyage through space that lay before us and what awaited us at the other end. Would the return passage be safely accomplished ? We had the assurance of Ashan that we would return to our own planet in safety, and we had a firm intuition that his prediction would come true. His knowledge whether of the past or of the future was absolutely right. We thought of the welcome that awaited us when we would be back among our own people. We recalled with a thrill of pleasure the old familiar faces that would gaze at us with an expression of unbounded admiration. There was a mist before our eyes and a quickening of the heart as thoughts of this nature came crowding into the mind.

The voice of Maruchi broke upon our day-dreams. 'Perhaps we are all thinking of the time when we shall once more be back among our own people and all that we have seen here will be a mere memory. This is quite natural and as the day comes nearer when we shall make our final salutation to this land of our dreams, our impatience will also grow everyday. But we are carrying back with us more than a memory. It has been our high privilege to meet one who is greater than any man we have known and whom we left only a few hours ago. It will be our misfortune if he were to become only a memory and not a guide and a permanent influence in our lives. It will profit us even now to recall his discourses and observations. So long as we were with him he never assumed the role of a teacher, and we do not know how his disciples are taught. But he never speaks except to teach for all his thoughts convey instruction. He lives and thinks on a plane altogether beyond our reach, but he speaks with great simplicity, though with great eloquence and a rare strength of conviction. Sahir, you have thought deeper than any of us and the Master's discourses must have appealed to you strongly. Can you recall some of his sayings ?'

'Who can forget them ?' I asked in reply. 'Since listening to him every one of us has become more thoughtful and life a more serious thing. A butterfly is by no means an uncommon sight and a naturalist will discourse learnedly about its life-history when he sees one, but the Master spoke about it from a very different point of view. What he said was to us of the nature of a revelation. But the most far-reaching doctrine that he enunciated was about previous and after births.'

'That is not a new theory and some of our ancient teachers and philosophers had a firm belief in it. The notable feature about what the Master said was his vivid realization and the cogency of his reasoning. Apart altogether from the probabilities of it this doctrine of reincarnation is most satisfying. If this life has no past and no future everything connected with life would be transient and fleeting. And yet there can be no question that man is capable of things which are immortal. As the Master pointed out how can anything that is made be greater than the maker or endure longer ? We have books and teachings that seem to be everlasting. These are the expressions of the immortal part of man. It is this part of him that is born again and again, and the highest aim is to escape this ceaseless rotation of birth and death.'

'Does it not coincide with the doctrine of the Buddha ?'

'Yes,' said Maruchi, 'he also believed in the memory of previous births—a belief that he shared with others of his race. You know there is a word in the Sanskrit language referring to this particular phase of memory. What do you think would happen if such a memory were to become the common possession of humanity ?'

'A most interesting question,' I said. 'It would lead to unbelievable complications and possibly to a complete deadlock. People would live not in the present but in the past. They would hardly take any interest in the affairs of this life. The human race would become a race of reminiscents. Even in this life there is a marked tendency to harp on the past as we grow old. Old men and women recall the memory of their younger days with pleasure and are usually dissatisfied with the present, mainly because they linger superfluous on the stage of life. There is a period of anecdotage that precedes senile decay and dotage. If we had been contemporaries of Alexander or Caeser and were born again at present with a clear remembrance of those times do you think we would take the faintest interest in the happenings of these degenerate times as we would designate them ? We would wax as eloquent as Demosthenes or Cicero, and denounce the present effiminate generation in burning philippics. The past has always an irresistible fascination. If we remembered our past lives we would never be happy unless we met those we used to know in our previous incarnations. Our sole endeavour would be to roll back the tide of time. The march of events would

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

come to a permanent halt. We would want the old occurrences to happen again and again. Our short memories are a safe-guard against such a disaster. Remember that the ultimate release from the treadmill of life and death is an individual problem and each one of us has to work out his own salvation. The human race does not move *en masse* even in the minor affairs of this life.'

'That is so. Then there is also the strange contradiction in our nature, the easy credulity in many matters and the confirmed scepticism in others. We easily accept many things on trust and refuse others even on good evidence.'

Orlon was rather preoccupied, but he had been listening to our conversation with attention. He now joined in it. 'What is called fatalism, or predestination, is an outcome of this belief in previous births. You may remember that in former times certain peoples, specially in Asia, believed that everything was pre-ordained and the book of fate was written on every man's forehead. The reason why such a belief was condemned was that it deprived man of the power of initiative and took away the driving force of stimulus from human effort. When a man failed in any enterprise, or any evil befell him he merely struck his forehead, which was in effect a confession of helpless impotence, and his spirit bowed to what he looked upon as the inevitable. But the doctrine of *karma*, for that is what the Master so elaborately expounded to us and what has been at the back of our own minds, is the very reverse of fatalism. More than any other theory it leaves man the maker and master of his own destiny. We are wayfarers threading our way through many countries, which are so many lives, and our going is good or we loiter as we will. We are tradesmen equipped with capital and we squander it or prosper according to our own capacity.

'Ah, Orlon,' remarked Maruchi, with a bright smile, 'if your silences are golden your speech is like a shower of jewels.'

'Have it your own way, you flatterer. You see how a large section of the human race put a wrong interpretation upon a simple but far-reaching doctrine. There is, however, a subtle distinction between the two phases of this doctrine. This was clearly indicated by the Master more than once, but the people who accepted fatalism as their creed could not make this distinction. The pivot of the whole doctrine is the law of cause and effect. No one can question or deny the existence of this law. The only difference has been in understanding its applicability. The fatalist believes that he is at the terminal end of the chain that runs from cause to effect. All that is happening, all that will happen is the effect of past causes. He leaves out of considera-tion the other fact that the process of causation does not cease any more than the happening of the effect. Life is partly what we made it in the past and partly what we make it in our present incarnation. You must have noted the reluctance of the Master to speak of the future in so far as it referred to an individual. He had in his mind the unpreventable effect from a cause that had already happened. He knows perfectly well what or who will be the living evidence of our visit to this planet; he prepared us for what will happen but he would not perturb us by disclosing the identity of our fellow-voyager. This particular incident need not be discussed further, but what we have to bear in mind is that the doctrine taught by the Master is nothing like fatalism.'

'That is perfectly clear,' I said; 'in fatalism there is no place for self-determination; one merely waits with folded hands for the pre-ordained inevitable. The Master, on the contrary, holds that the entire responsibility is our own. We cannot of course avoid or escape the effect, but the cause is in our own hands. The harvest that we reap is of our own sowing. Instead of being passive instruments in the hands of destiny we are the architects of our own future, and we make it or mar it according to our own inclination and our own efforts.'

Maruchi said, 'We are all agreed as to the tenets of the Master's doctrine and we also know that it has been taught and accepted by a very large section of our fellow human beings on earth. But I wonder whether there is any explanation within our understanding of the miraculous powers possessed by the Master. He himself has given a very lucid explanation, but is it comprehensible to our intelligence? You, Sahir, chaffed me about what you called my hunger for miracles, though I am sure all of you were as keen as myself. Well, that hunger has been satisfied, but what is the explanation?'

I said, 'We had it from the Master himself and how can we improve upon it? Men who have said that miracles do not happen, or have ridiculed them as the credulous belief of an ignorant superstition were themselves ignorant. Our minds move in certain well-marked circles and beyond these they cannot go. But as the circles widen our comprehension grows. The progress is step by step, and it is within our knowledge that what was impossible or miraculous in the past is easily accomplished in the present. There is only one fact which seems remarkable and that is that miracles were known when most of the inventions of science were unknown. The two are on two different planes and the searchings of the spirit began much earlier than the inventions of science. This was due to the preparation in previous incarnations. When we go back to the world people will say we have performed a marvellous feat but does it not seem quite insignificant compared to what we have seen the Master doing? You, Maruchi, and I have actually felt his power over our minds. How can we explain that power when the region of

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the spirit is an unknown country to us? Consider the progress of the human race. It is far more advanced than in ancient times, but have we produced another Buddha or Christ? These Masters did not possess the scientific knowledge that we have acquired in recent times, but their wisdom and their powers have never been equalled after them. How can we explain the greatness of these teachers except on the theory that they had concentrated all their powers in past incarnations on the advancement of the spiritual faculty? The possessions of the world and the cultivation of the intellect had no attraction for them. It cannot be doubted for a moment that they had intellectual gifts of a very high order, but these were subservient to the spirit which dominated all other faculties. The wonders of science are as nothing compared to the wonders of the spirit. We have sought to develop the forces that exist outside of ourselves; these Masters have cultivated powers innate in their own selves. To ignorant people the triumphs of science are like miracles; to us the things that we have seen done by Ashan are miracles, because they baffle us and we do not know how to account for them.'

The conversation then took a more practical turn. We spoke about Opi and the monks, but not much about Narga. Our intention was to make a very brief stay at Opi and to start on the homeward voyage as early as possible. Before leaving Ashan's hermitage Nabor had told us that he would overhaul the machine thoroughly before we commenced the long passage back to our own planet. This might take a week and we proposed leaving Opi as soon as Nabor finished his work.

The distance between Raba and Opi as the crow flies is not very great and we remembered that we had seen the vapour column of Raba the morning we landed at Opi. Swiftly and silently we flew towards our destination over new lands and new scenes, rugged hilly tracts alternating with pastoral landscapes. There were many townships and large and small villages but we did not pass over large cities. The soil in many parts of Mars must be very fertile for there were signs of a luxurious vegetation wherever we had gone and the rainfall appeared to be well distributed. The greenery was most grateful and restful to the eye, while the display of colour in woodlands in which flowers abounded was dazzling. Mars is undoubtedly the botanist's paradise. There were very few flowers which had no scent, and very often the aroma was as exquisite as it was varied. Nature had dowered the red planet with a prodigal hand.

It was an hour before sunset that we reached Opi. Nabor circled over the monastery twice and played a lively tune upon his instrument to give intimation of our arrival. We landed in front of the building we had formerly used as a hangar for our machine.

XL

Nabor's musical call had the desired effect. As we alighted on the ground we saw Karos and several other monks hurrying towards us. They greeted us with great warmth and informed us that our old rooms were ready for our use and they were very pleased to see us again. As we moved towards the building I noticed that Orlon's eyes were eagerly looking in that direction. I knew that he was looking for Narga, who of course could not come out like the monks to meet us outside the monastery. Such eagerness on her part would have compromised her dignity in the eyes of the monks. Still as we approached the building, Karos and the others keeping up an animated conversation with Maruchi, I had a glimpse of the flutter of a white hand for a moment and knew it was Narga's welcome to Orlon.

When we entered the passage that led to the various wings of the star-shaped building we saw Narga standing in the doorway of one of the rooms. It was impossible to look at that vision of beauty without a thrill. She stood radiant in the dazzling splendour of her beauty, her face aglow with pleasure and her eyes shining with a suspicion of moisture in them. She was the same and yet not the same. There was a new grace in the curves of her peerless form, there was a new languor in her limbs, a new timidity in her mien.

There was a hunger in her eyes that I had not seen before, and a slight heaving of the bosom. Probably Maruchi and the others noticed no change, and my eyes might have been somewhat influenced by my imagination. Narga's eyes met ours in smiling welcome, and they rested on Orlon's for the shadow of an instant longer, but they passed on to Nabor and Ganimet. Then the cadenced music of her voice was in our ears.

'Welcome, my friends from a world which to our eyes is only a luminary in the heavens, thrice welcome! You have seen all that you wanted to see of this world of ours, and I thank Raba that he has had you in his safe keeping.'

We bowed to her with profound respect and Maruchi thanked her on our behalf. 'Lady', said he, 'nothing can exceed the graciousness of your welcome. We are here not only in fulfilment of our promise, but because we have been eagerly looking forward to this day, to the honour of standing once more in your presence and the pleasure of meeting our friends here before our final departure from your wonderful world.'

Narga frowned archly in mock displeasure. 'What talk is this of departure at the moment of arrival? Nay, nay, it is not good to speak of parting at the instant of meeting. We shall hold you prisoners at our sovereign pleasure. We shall hold you to ransom which shall be the treasure of your wisdom, and you will not get your liberty until your coffers are empty. How say you, my good Karos?'

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

'Well and wisely spoken, my lady, you have spoken our thought in language which we could never find.'

Maruchi bowed low again. 'We are overwhelmed by the exceeding great measure of your kindness and we yield ourselves ready prisoners to your sovereign will and we place our liberty and our lives unreservedly in your fair and all-conquering hands.'

And in the quick humour of the moment Maruchi stepped forward and knelt before the Lady Narga, and lifting her beautiful hands saluted it lightly with his lips, and then rose and stood back with his head bowed.

No knight of the ancient days of chivalry could have done what Maruchi did with a more courtly grace or with greater propriety. He saluted Narga as one bends before a great queen. We were not only amazed but felt dubious about the effect on Karos and the other monks. Would they approve of the high priestess being treated as a great court lady? I looked at Karos and saw at once that he had fixed his eyes upon Maruchi in a puzzled stare. He was not thinking of the knightliness of the homage, but the immunity of Maruchi from the consequences of his rashness in touching Narga. Was not she like a live electric wire, whose touch would have knocked down, if not killed, a man? And here was Maruchi perfectly unconcerned as if he had touched a mere woman.

Narga's eyes were beaming with pleasure and a bewitching roguery. 'Sir Knight', she said, 'I thank you for your knightly courtesy and your chivalrous surrender. Rest you now with your brother knights and give us an early opportunity of listening to your adventures and knightly deeds, and tell us of the damsels in distress whom you rescued?'

Narga inclined her head and passed inside the room, closing the door behind her.

In our own rooms Karos asked Maruchi excitedly, 'Did you feel nothing when you touched Narga?'

'No. Why should I?'

'Because she is much more magnetic than we are and no man may touch her with safety to himself.'

'Well, I did, and you saw that nothing happened.'

'Strange!' said Karos, and then he and his companions withdrew and we were left to ourselves.

'Maruchi,' I said, 'I am sure in a former incarnation you must have been of the knights of King Arthur's Round Table.'

'Sir Lancelot?' suggested Orlon, with sly malice. He was scarcely pleased that such honour should have befallen any man other than himself, for in his heart he knew that he was the chosen Knight of Narga.

'Not so,' I answered, 'that would be a calumny Maruchi must have been Sir Galahad himself.'

'I am glad,' said Maruchi, 'that I rendered her the homage due to a princess for though royalty has ceased to be the individual right of a man or woman to be royal will always remain. The mistake that they made in the old times was in thinking that there was heredity in royalty. Kingliness or queenliness is a personal distinction. Have you anywhere seen a more royal personage than Ashan, or a more queenly figure than Narga, and the one is a hermit and the other is a nun?'

'True,' murmured Orlon. 'You are right as usual, Maruchi.'

We had no thought of spending the afternoon and evening in our rooms. We had a wash, put on the robes that Karos had given us and strolled out in the open, Nabor and Ganimet were already at work on the machine which they had taken inside the improvised hangar. Although we did not openly speak about it all of us were more or less impatient to start on the homeward voyage, and the pilot and his mechanic knew that we would be ready as soon as they were ready.

On descending from the airship I had noticed a new face among the monks who welcomed us. We had not seen him during our first stay at Opi and he did not seem to belong to the order of monks. I did not take particular notice of him but as the three of us, Maruchi, Orlon and myself, came out, we saw this man loitering in front of the monastery evidently with the intention of accosting us. This might have been due to a perfectly natural curiosity, for the manner of our coming as well as the fact that we were visitors from another world were bound to make any one curious. But somehow I had taken an immediate dislike to the man. He was a sleek, undersized individual with shifty, ferrety eyes that never looked one squarely in the eyes. He cringed as he saluted us and his smirk was in keeping with his attitude.

'You seem to be a newcomer here, my friend,' I began without ceremony.

'Yes, master, I am a traveller like yourselves and the reverend fathers here have been very good to me.'

'Do you intend joining the order of the monks?'

'I am not worthy. I am only a poor sinner whose feet have fortunately strayed to this place.' He piously turned up his eyes as he said this.

Maruchi and Orlon had been also looking at the man and they must have taken his measure correctly. 'What's your name, friend?' asked Maruchi suddenly.

'Jomel,' said the man.

And what is your occupation?'

'I do odd jobs when I get them, but I have some means of my own and as my wants are few, I get along without much difficulty.'

'You are a lucky man. And your thoughts have now turned to religion?'

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

'You may say so, but I am of no consequence.'

The humility of the man did not impress us at all.

As we walked towards the building where the machine was kept Karos and some others joined us and the man Jomel followed close at our heels. We found Nabor and Ganimet working inside the machine. They were carefully examining the machinery. As the light was partially failing they had turned on the electric lights and were going over every part of the machine.

'Well?' asked Maruchi, looking at Nabor, 'what is your report?'

'Everything is right, Sir, but we shall clean the whole machine thoroughly and perhaps substitute a few new parts. On the return flight we shall not be able to halt anywhere for repairs.'

'No,' said Maruchi with a broad smile, 'unless you look out for a half-way house in the moon.'

As Maruchi and Nabor were speaking in our own language no one else could understand a word of what was being said, but Jomel was looking at the machine very curiously, and while Maruchi was talking to Karos about Sipri the other man asked me slyly, 'How would you return to your world if anything went wrong with your machine?'

I was somewhat startled and looked keenly at this man of evil thoughts. Then I said grimly, 'We take good care that nothing should happen to our machine. You may just as well know that if any one else were to lay his hands upon the machine it would mean death to him.'

The man smiled slyly and actually winked at me. 'You are surely pulling my legs,' he said.

'Come and touch the machine,' I invited him.

He made a deprecatory gesture. 'I have no thought of touching your machine.'

It was nearly dark now. Maruchi and Karos were engaged in an animated conversation to which the other monks were listening intently. Orlon was standing silently apart and had moved to one side of the machine from which he could not be seen. Then he quietly slipped out of the building. I had all along fully expected him to do so.

A few moments passed and then Jomel made a movement to pass out of the building. I laid a detaining hand upon his shoulder, and as he tried to wriggle out of my hold I tightened my grasp and fairly laughed—silently—in his face. 'Whither away in such a hurry, my friend?'

Jomel scowled, 'I want to go out for a breath of air. I find it rather close here.'

I linked my arm into his. 'You are perfectly right, I feel suffocated. Where shall we go?'

I rather led or dragged him to the open entrance. The man was almost speechless with vexation but my attitude and my gestures were so friendly that he could not utter a word of remonstrance or protest, though he understood all the time that I had no mind to let him pas out of my sight. The shades of evening wer closing in and, as I had fully expected, Orlo was nowhere to be seen. Jomel glanced this wa and that and then said, 'Your friend who wen out a little while ago seems to have disappeared.'

'As he is not likely to be lost you need no have any anxiety on his account.'

'You are pleased to be merry. I was wonde ing where he could have gone all by himself.'

'It would be better for you to cease to wonde Curiosity is not always a healthy habit. M friend's temper is not of the best and I woul not answer for the consequences if he found ou you were following him or dogging his steps.'

Jomel tried a little bluff. 'I can go where like. I take orders from no one.'

'Softly, my friend. You are quite free t go where you like, but you must restrain yo curiosity a little and must not play the spy.'

Jomel muttered something and turned bac into the building. Nothing loath, I retraced m steps with him.

A little later, all of us came out and we sa Orlon sauntering towards us, his head held hig and his eyes shining. I knew he had been t the trysting place and had met Narga. To hi I spoke no word as Jomel was watching hi from the corner of his eyes, but I drew Nab aside and whispered to him, 'I think it will b safer if you and Ganimet sleep in the machin I don't like the looks of this new man here. H is very curious about the machine and wants t spy on every one of us. He may tamper with t machine in ignorance or out of sheer wickedne

Nabor expressed his willingness to sleep the machine.

'And you might turn on the current on t wires outside the machine.'

'We surely will. We shall take no chances

Immediately after dinner Nabor and Gani went away to pass the night in the machine. I h given a hint to Maruchi that it would be s if they remained in charge of the airship at ni and he approved of my suggestion. We h three rooms and I took Orlon into my own ro and asked him, lowering my voice, what thought of the man Jomel, who had b assigned a room beyond our own.

'He is a snake in the grass,' was Orl prompt reply.

'This evening when you went out of building where the machine is kept he tried follow you, evidently with the object of spy on your movements.'

Orlon became very pale. 'My God!' exclaimed, 'did he actually follow me?'

'No, I did not permit him to do so, another time he may elude my vigilance and follow you without my knowledge.

Orlon looked at me in silence and then as "Sahir, you know something?"

(To be continued)

ELEVEN YEARS OF FASCISM

A Study

By P. N. ROY

TODAY, the 28th of October, 1933, Fascist Italy celebrates the eleventh year of its existence.

The wonderfully blue Italian sky has today a sombre and a rather solemn look on account of the grayish clouds that are moving about in a leisurely fashion, and underneath it are flying the flags of the country—national flags of green, white and red and black Party-flags with the symbol of the *fascio* in the middle, producing a contrast of colour with the sky overhead.

At the foot of the huge white monument bedecked with gold here and there, the national monument erected to symbolize the independence of Italy and the completion of its unity, in the large Piazza Venezia and in the streets that lead into it, have gathered people in their thousands—men, women, boys and girls—to celebrate the solemn occasion, the national festival of the march on Rome.

Above all this crowd three aeroplanes are moving about in the form of a triangle producing a noise that is the music of the occasion.

All have come today to join the solemn but joyous celebration, to reiterate their faith in the Duce and the new government. In the days of its birth many did not recognize the potentiality of the new force and predicted its death within a week. Weeks have passed, months have passed, years have passed and with the passing of every week, month and year the new force has moved forward with redoubled strength to inspire hope and confidence in its adherents and to urge them to further activity.

What is the magic that has performed all this change in Italy? What is the thing that the crowd of today has come to pay its homage to? What is the secret that has kept this government and the party, about which pessimistic opinions were held by many, in power? Is it merely coercion, is it merely the weeding of the country of all undesirable elements so that peace and party-interests may reign supreme, and keeping an efficient system of espionage so that every revolutionary effort might be immediately throttled to death? Or is there something in this party, this government,—some paternal love, some fraternal kindness which the mass-m ind instinctively and quickly perceives, that attracts the nation to its support? These are the thoughts that passed through my mind as I stood alone in the crowd watching the celebration.

Apart from the fact that there are no things in the world which might not be criticized in certain aspects, it must be admitted without reserve that the Fascist government has been a great success in Italy, a success which she has not known for many many centuries. And this success has not been the result of effective propaganda as is presumed by many. Effective propaganda may succeed for a moment but it can never add stamina to a man or to a party or to a government unless the stamina for growth is there. One cannot hoodwink the world for long with propaganda, because sooner or later the acts of a man as also those of a government are brought to light and the world sits in judgment upon it.

But to return to our question. What is the significance of today's celebration? Eleven years ago a group of men, destined to change the history of their country, made a march on Rome and took charge of the government. It was an epoch-making incident in the history of the country in so far as it meant the fall of a government and the advent of another, but it was something more, it was the fall of a mentality. Who marched on Rome and who abdicated the government? To Rome marched back the Romans and out of it went away the pseudo-Romans. When every year, at this date, the Italians gather to celebrate the occasion, they gather to hail the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

returned Romans, the returning spirit of Rome.

Let me be more explicit. The rise of Fascism is considered by many to be due to the particular historical circumstances of the country after the post-war period. In so far as the events of the world carry an element of fatality with them, it is quite true that Fascism could evolve itself only on the then politico-economic conditions of Italy. But the explanation does not explain everything. It does not explain those spiritual elements of Fascism which today we find throwing into the background the merely political and economic way of government. It does not explain how out of the baptismal bath of the war Italy, of all the countries, came out first to start a new career in the world. I consider Fascism to be a non-rational movement. However much the theorists of Fascism might speak and write about the "classe dirigente" and the Fascist aristocracy, to me Fascism seems to be the expression of the mass-mind of Italy, that mass-mind whose movements are always non-rational and which is the best custodian of the spiritual treasures of a nation's civilization. It is not for nothing that Mussolini, who by birth belongs to the humbler folk, sits at the head of the government. It is the non-rational mass-mind that, already stirred before but violently shaken by the shock of the war, took a fateful direction and Mussolini is the expression of that activity of the mass-mind. The particular politico-economic conditions were only contrivances of the destiny of the nation to help this re-flowering of the people. My explanation may seem to be mystical, but where personalities are concerned, where the question involved is that of unexpected and sometimes inexplicable aspects which an historical incident assumes, one cannot avoid being mystical. And in fact, is there not, notwithstanding all our rational explanation, a mystery shrouding the entire evolution of human history?

If we want to understand Fascism, we must go to the deepest depth of the science of sociology, we must dare to penetrate into race-metaphysics. Unless we do so, we cannot understand many of the acts of Mussolini, because Fascism—rather Italian Fascism, because the term is being adopted by other countries as well to express similar movements—is the expression of a national temper, of a special national outlook on life, an outlook that is determined by the entire tradition of the country. If it were a merely economico-political doctrine, it would have attained its goal and finished its mission by giving to the world its corporative system and the labour-charter. When it began its career, the economic question was the most pressing one, and its solution was the first vital necessity and so its attention was at first absorbed by it. And even today when it has to show before the world its record of achievement, it points to this because this is the thing that has the most universal appeal on account of its practical utility for all people that are suffering from the canker of modern economic evils. But it covers within its activity more subtle things, I should say also more important, inasmuch as the characteristic politico-economic structure of Fascism will succeed and endure to the extent it succeeds to give those subtler things a more concrete and durable shape.

These subtle things consist in moulding, slowly but surely, the character, rather re-awakening the slumbering qualities of the race—the qualities of the mighty Romans as tempered by the Catholic Church. I say the Catholic Church not as a rigid institution as we find it today. The original Catholic Church was the product of the union of Asiatic mysticism with the Roman instinct for universality and organization. This new catholicism, born out of this Asiatic and Roman union, flourished long in the original Catholic Church and kept it plastic but in course of time, with the development of formulas and dogmas, the Church lost the plastic character, but not the people in whom the new element continued to thrive. Hence it is that side by side with that strong admiration for the Roman qualities that build up social solidarity and conduces to a practical evaluation of life, we find in Fascism a strong fascination for that mellow idealism of which this Catholicism is the exponent and champion. Italian Fascism has this double characteristic of being intensely practical and at the same time intensely idealistic. In this it is a characteristic expression of the Italian mass-mind whose practicality is modified by its

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

idealism and whose idealism is modified by its practical sense. We may look for political motives behind the Lateran treaty—but this is so far as the Pope as the head of a religious State is concerned. But what about the teaching of religion in the schools, what about the impetus that Fascism gives to the revival of many popular religious festivals, what about the constant reference which Fascism makes to the fundamental moral law of the world in its career of intense activity? What about the claim that is made of St. Francis of Assisi as the most Fascist of all saints? All these do not emanate at least directly, from political motives. On the contrary, in the heart of Fascism there is a mystic throb that is in excellent rhythm with its many political throbbings and the idealistic side of Fascism is the external manifestation of that throb.

I have said that Fascism is an expression of the Italian mass-mind. To understand this let us analyse the character of the Italian people, particularly of the Italian peasant-folk. I think that the Italian peasant-folk preserves as yet the traditions of the Italian pre-Renaissance era. The mentality and outlook of the Italian peasant makes him a different man from his brother, say in Germany or England. The effects of the modern civilization have touched the fringe of his life so far as the fundamental social institutions and human relations are concerned. That economic view of life which is now so blatantly prominent in the entire western world and even among the higher classes in Italy, has not that maddening fascination for him. Withal he understands very well the necessity of economic solidarity in life. This attitude makes him labour hard in order to render the economic position of his family sound, but does not induce him to sell anything but the surplus of his production in order only to buy the other necessaries of life. The family instinct is strong in him and induces him to take his midday meal at home surrounded by his wife and children, as also the meal at night. The proprietary instinct is also strong in him. He has to a large extent the spirit of obedience in him so long as no encroachment is made upon the sacred domain of his private life. He still maintains human relationship with his neighbours and the master. He has reverence for his Church and it is a very common sight in Italy to find peasant women kneeling down in the churches and with tears in their eyes making silent prayers to God. He celebrates religious festivals with the same sincerity as the Indian peasant does and names his children according to the names of different saints. But at the same time he is a tolerant man, preserving the Roman tradition of universality. It is difficult to detect any colour or race-prejudice in him. When he marrries he prefers to go to the church rather than get into the bond according to the civil laws. And when he looks round him at the monumental structures in ruins, of which his country is full, he has a dim vision of the distant past of his country and an uneasy feeling in his mind.

At the same time this people is to a certain extent conscious of the part it has played in history. It is conscious of the power it enjoyed during the republican days of Roman history. It is conscious of the part it played in the development of the communes and the entire idealism of the Renaissance period. The great thing in history is when history is made by the stirring of the soul of the entire people, when the process of historical evolution takes its birth in the inner workings of the mass-mind. This has been the case in India where the entire civilization of Brahmanical tradition has been so often modified and re-made by influences coming from the popular classes. This has also happened in Italy where the real history does not belong to the kings and the emperors but to the people.

With this flickering sense of its historical position in the past, this people had an awkward feeling of its present position in the world. Italy was so long walking along a by-path of modern civilization; because modern civilization is made of those very elements which Italy lacks physically and mentally. Physically, modern civilization is the product of coal and iron, the two things to the possession of which Italy can lay no claim and so with every scientific discovery that tended to industrial development and the production of wealth, she fell more and more into the background. The modern mentality is based on this industrial development and the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

production of wealth—a mentality whose chief concern is material comforts and individual aggrandizement. This is in discord with the formation of the Italian mind. In the Italian mind there is a strong combination of material and spiritual inclinations. The whole expression of the Italian mind in art, poetry and philosophy is a testimony to the incapability of the Italian mind to adopt an entirely materialistic outlook on life. In the Italian mind matter must be spiritualized and the spirit must be made sensuous. In the Italian mind the two things may be seen to balance each other. As Major Barnes in his book on Fascism says : "It constitutes a good example of the kind of mentality and of the kind of approach to the problems of life issuing from it. The view of life is eminently synthetic, arising from the habit of thinking intuitively."

With these physical and mental conditions Italy could not keep pace with the progress of modern civilization and she felt her situation more bitterly on account of the attitude towards her of the other progressive nations who considered her to be an exhausted nation incapable of making any new effort. The bitterness was further increased by the mentality of the upper classes of her society who were very much under the influence of the *oltre-alpe* (trans-Alpine) political and social thought.

The first expression of this awkward feeling in the mass-mind of Italy is to be found in the idealistic-religious aspect of the Risorgimento as developed by Mazzini and Gioberti. These two great thinkers perceived intuitively that if the Italian people were to rise again and play a new rôle in the world in competition with the other nations, they must develop along the line of their history, which line was in its turn traced by the moral outlook of the race. So these two writers emphasized the awakening of the moral qualities of the race and the development and preservation of those institutions in which those moral qualities were embodied. They recognized that for Italy the great problem was not merely liberty, but liberty with authority, and if this liberty with authority was to be obtained, the idea of liberty must be taken beyond the plane of politics and based upon the moral experience of the race, which experience revealed itself through the Church for Manzoni, through the State for Gioberti and through the conception of universalism for Mazzini. When liberty is thus based on the accumulated moral experience of the race, the individual loses that supremacy which he enjoys under the Jacobean conception of liberty and his rights are balanced by corresponding duties. So for these thinkers the conception of *diritti e doveri* (rights and duties), the element of religiousness in their outlook on life, the vision of the State as an ethical substance whose business is not merely to govern in a negative manner but to promote culture, morality and civilization in a positive way.

This is an attitude that is against the entire trend of the so-called modern civilization. This attitude has derived immense nutrition from the above-mentioned feeling of the Italian mass-mind, because Italy has been made to feel that if she is to regain her former position in the hierarchy of nations, she can do so by creating a new ideal of life out of the elements of the character of her people and by imposing that ideal upon the world. She must go out into the world with the message that modern civilization has revealed its merits and demerits ; the standard of value must now be changed and the civilization recast.

II

We are now in a position to understand how Fascism is a movement of the mass-mind of Italy, how its advent to power means not only the change of government but also the fall of a mentality. The neo-Europeans of Italy, who grew in number and were very influential and controlled the helm of affairs in the latter part of the nineteenth century and continued to control it till the end of the war, maintained an attitude that was thoroughly trans-Alpine. Their ideals were the ideals of 1789 and their consequent developments. In the field of thought they exalted and looked up for inspiration to the masters of positivism and materialism. In the field of politics they tried to experiment with the democratic-liberal form of government, believing in the fundamental rights of men. In the field of economics they tried to import the ideas of Marxian socialism and organize labour into trade unions and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

syndicates. It is unnecessary to go into the details of the chaos in Italian political life that existed during the entire period of the control of affairs by these neo-Europeans. Suffice it to say that as a result of their creating a State that was an instrument for personal egoism of individuals, the country headed towards a process of dissolution and anarchy, and the forces of the State were reduced to the minimum of strength.

Fascism is a reaction against this neo-European mentality and a vigorous reassertion of the spirit of the Italian people. So its chief significance is not so much political as moral, and that it is a movement of the people is evident from its determination to give prominence to the moral qualities of the Italian mass and to pursue a programme of reconstruction based on the characteristic qualities of the mind and character of the race. We have seen the moral qualities of the Italian people. Fascism eulogizes these and sets before it a definite standard of character, based on these qualities. Its very success and rapid growth indicates that it is a thing of the soil. Fascism intends to make the traditions and mentality of the Italian mass the basis of its programme for spiritual renovation of the country, because that is not only the line of least resistance but also the one that would give the best results. The corporative organization of society comes from its Roman sense of social solidarity ; the preservation of individual initiative and private ownership in the field of production comes from its proprietary instinct ; the rejection of material outlook on life by Fascism comes from the peculiar formation of the Italian mind ; Fascism's reverence for the institution of family comes from its deep family instinct ; and the programme of ruralization is adopted not only because the greater part of the Italian mass is agricultural but also because it is favourable to the development and preservation of the anti-materialistic qualities of the race.

We see how closely the two expressions of the Italian mass-mind, the Risorgimento of Manzoni, Mazzini and Gioberti and the Fascism of Mussolini, resemble in their general features, in their conception of liberty and duty, in their exaltation of the idea of Romanity or rather Italianity in their idealistic and religious approach to life, in their conception of the ordering of society under an ethical State, in their recognition of the necessity of establishing a moral standard of value. Fascism has returned to the spirit of the Risorgimento, or rather the spirit of the Risorgimento, which suffered a set-back from the acute political and economic problems of the country and the other handicaps from which a newly-born nation suffers and was overpowered by the fascinating ideologies of the nineteenth century, has reappeared in the garb of Fascism after the war had reduced to ashes the debris of these ideologies.

Fascism is thus a new *welt-anschauung*, rather an old *welt-anschauung* in a new form. It appeared first as a political and economic doctrine because it was primarily a reaction against modern civilization which is political and economic. But the quintessence of Fascism consists in a moral vision of life, in the perception of a moral law operating in the heart of the world and in tuning the rhythm of individual as well as social activity to the operation of this moral law. Hence in Fascism it is not the majority that counts but the minority that feels within it the operation of this moral law. This minority, when acting in accordance with this moral law, cannot but act in a manner that will lead to general welfare. It is in this sense and in this sense alone, that there is justification for "Fascist Aristocracy" in the art of government, which is not an aristocracy of birth or money but of moral perception. The glory of the Fascist State also consists in this that it centralizes and regulates the entire moral activity of the race. It is a State that is not a legal contract, it is not an artificial creation of the individual, but a natural and organic exigence, immanent in the spirit of the individual himself and a postulate to his morality. This is what is meant by the ethical State and explains the dictum of Mussolini : "Everything within the State, nothing outside the State, nothing against the State."

Fascism being essentially a moral vision of life, the chief task for Fascism is the education of the race and the proper formation of the character thereof. It may be said that if Fascism is a movement of the mass-mind, the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

character already exists. Yes, but it exists in an amorphous state. It is necessary to bring this character into relief by giving it a greater coherence and exhibiting all its brightness after removing the dirty crusts of four centuries of decadence. So if anybody asks me what are the most important institutions of Fascism, I shall not name its political or economic institutions, but those that are connected with the proper training of the race.

The first of these in importance is certainly the educational organization of Fascism. And this is recognized by Mussolini when he says that "the most fascist of all reforms is the reform of education." The aim of this educational reform is to produce that balanced life which Fascism considers as its ideal. Man is made up of the mind, the body and the spirit. Modern education is too intellectual, too much a matter of specialization, with the result that it leads to a one-sided development of human character. The aim of Fascism is to unify and integrate the different sides of human nature so that the character formed under education may have a harmony, which harmony in individual life will ultimately lead to the promotion of social harmony and the harmony of the activity of the State. The body must have its proper care and growth, just as the mind and the spirit. The mind should not grow at the expense of the body and the spirit and the spirit cannot be kept starved to feed the body and the mind. A sort of musical harmony between them must exist. So Fascism promotes sport and includes in its educational programme religion and the aesthetic subjects. And if this new educational reform is to produce its desired effect, the greatest care should be taken in the education that is imparted in the elementary and primary schools, because the nation lives in children. So the greatest reform has been made in the school-curriculum. The imparting of education in the schools has been brought directly under the control of the State. The State prepares the syllabus and text-books are written according to that syllabus. The examination is also controlled by the State. There is one prescribed book containing the entire course in religion, grammar, literature, arithmetic, history, geography, general culture, principal physical phenomena in relation to human life, calligraphy and drawing. The reform was at first promoted by Gentile and it was supplemented by the Royal Decree of November 5, 1930, which fixed the programme of examination in every subject. Before me now lies such a book written according to the syllabus fixed by the State. As I go through it I perceive how the whole thing has been designed not only to give an essential all-round knowledge to the pupil but also to develop the mental and moral qualities according to the Fascist ideal. The historical portion contains sketches of the men who have made the history of the country and nourishes the nationalistic spirit. The cultural portion gives an idea of the arts, professions and trades, of the family, the communes, the State and the regime and lays down the principal rights and duties of the citizen. It is significant that the duties are placed first and the rights after them. The chief duties of the citizen are : (1) obedience, (2) lending military service, (3) payment of taxes. The chief rights are : (1) equality of all citizens in the eye of law, (2) the right of ownership, (3) personal liberty, (4) liberty of thought and of the press and of forming associations so long as it does not involve the safety of the State and the tranquillity of the citizens, (5) the right to vote. Physical education begins with simple drill in the elemetary schools and ends with the training imparted by the Academy for Physical Education. There is also compulsory military training for eighteen months for all adults. The impetus given by Fascism to physical education is evident in the many championships established by the State and the Communes all over Italy.

Next to the educational organization come the Balilla, Avanguardisti and Giovani Fascisti (young fascists) organizations. It is through these organizations that Fascism is injecting its spirit into the race. The most important ideas of Fascism are the ancient Roman discipline and hierarchy. These two ideals are being realized through these organizations. There are three age divisions according to the three different organizations. The Balilla organization is for boys from 8 to 14 years of age, the Avanguardisti from 14 to 18, the Giovani Fascisti from 18 to 21, after which age

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the members become full-fledged fascists. The name Balilla has a history behind it. On the 6th of December, 1746, a heavy artillery waggon, which the Austrians were dragging along the streets of the city of Genoa, got stuck into the ground rendered soft by the rain. The officer who commanded the company ordered the Italian passers-by to help the soldiers to disengage the waggon, and seeing that the passers-by did not seem to hear him, he caught hold of some and whipped them, trying by this method to make them obey his orders. At this act, a boy of eleven, named Gian Battista Perasso, nicknamed Balilla, picked up a big piece of stone and hurled it at the officer who, struck violently on the forehead, fell to the ground. After this, in a few minutes, all the people came down to the street and there was a regular organized revolt and the Austrians were driven out of Genoa.

Side by side with these organizations, there is another organization known as "Fasci all 'Estero," which carries the spirit of Italianity and the ideal of Fascism to those who have been forced to leave the motherland and live under foreign skies. These organizations are the supreme examples of how Fascism is rearing up the new Italian race. This summer I had the privilege of seeing the members of these youth organizations assembled in Rome in two camps and from the talk that I had with many of them, I could feel how the entire nation was slowly but surely regaining its lost self through these young flowers of the race. There were about sixty thousand of them come from all parts of Italy and from over 120 foreign towns and countries. For two months they lived in camps like soldiers under the strict discipline of the camp life, with the routine of the daily life fixed beforehand and rigorously followed. Little boys and inexperienced youngsters how cheerfully they submitted themselves to this discipline, far away from their parents and affectionate relations! The camps, the uniforms, the expenses of travel and the daily expenses of each and every boy were supplied by the State. A huge expenditure it might be said, but it is the most judicious investment that the State is making because the hope of Italy, the triumph of Italianity lies in them; because it is on this new generation trained under the Fascist method that the continuation of the political and economic institutions of Fascism depends. The happiest sign in the movement is that it is supported by the people. Most of the members of the organizations come from the labouring classes. In my talks with them I found how the fire of patriotism was burning in the souls of these young creatures and how keenly they appreciated the many good things that the Fascist regime has been doing for the people. One boy told me: "Formerly in Italy everybody considered himself important and nobody wanted to follow. The misery of Italy was due to that. Now the things are changed. Now we follow Mussolini because Mussolini is always right."

The feeling that Mussolini is always right is very common among the popular classes. This is the greatest source of strength for Fascism. This source has been tapped not by coercion but by winning the sympathy of the people through many good deeds. It is wrong to consider Fascism as a capitalistic regime. In the beginning it had the sympathy of the capitalists. But it was a temporary phase of Fascism determined by the circumstances of the country. The capitalistic sympathy was utilized by Fascism in order to strengthen itself to fight against the Bolshevic forces that ruled Italian life at the time. But it did not mean any domination of Fascism by Capitalism. Fascism was anti-Bolshevic but it was not anti-Labour. In fact, the capitalistic influence lasted so long as Fascism remained a party movement, but as soon as it came to power and identified itself with the State and the nation, it got rid of the capitalistic influence by its own inner revolutionary force and took up the positive side of the socialistic programme. The socialists by emphasizing their negative programme of ruining capitalism by means of strikes and anti-Statal activities, paralysed industry and weakened the State, but they themselves had not the courage to take the entire responsibility of the State and industry on them. This disappointed a large part of the urban as well as rural proletariat of Italy and with the growing strength of Fascism many of the proletarian organizations in the country and the town came over to

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the side of Fascism. And Fascism has ever since been acting as a guardian angel of the Italian proletariat. If the conditions of any classes have been ameliorated under the Fascist regime, it is that of the popular classes. The Fascist government cares for them with paternal love. Conditions of labour have been remarkably improved and so also the housing conditions. The regime has built many quarters where the poor may have accommodation at a cheap rate. Lands have been reclaimed and colonies built for the popular classes. The celebrated Littoria is a colony built by the regime where quarters have been constructed for nearly fifty thousand families with all modern comforts. Of late another colony has been established at Sabaudia. What is admireble in Fascism is the frankness and honesty of intentions with which it approaches the people. There is a ring of sincerity in its appeal to the people which the masses immediately appreciate. There is one particular institution through which the regime is winning the affection of the people. It is the Opera Nazionale Dopo-Lavoro (After-Work Labour Association). This institution whose branches are spread over the whole of Italy inasmuch as every trade union has a *dopolavoro* organizatiou, looks after the development of the physical, intellectual and moral capacity of the people. It has established physical culture institutes, clubs, libraries for the working people. And during my brief stay in Italy, I have noticed how this institute provides for other amenities of life for the people. In the cinema, in the theatre, in every other kind of amusements there is a special *dopolavoro* ticket for the people. There are special trains at a nominal price for tickets to enable the popular classes to make holiday trips. Another concession which has a permanent character, is the reduction of railway fares amounting to 80% for newly-married couples. The joys of art, music, sport, and travel are thus brought to the doors of the people by the State.

Another institute which cares for the race and is at the same time an instrument for winning the sympathy of the people, is the *Opera Nazionale per la Protezione ed Assistenza della Maternita ed Infanzia* (Materntiy and Infant Welfare Society). I visited one such institute and saw parturient mothers lying in bed and newly-born babies left in care of the State while the mothers were away for the day's work. This particular institute has arrangements for three kinds of work :—(*i*) to assist in parturition, (*ii*) to care for babies who are deserted by their perents, (*iii*) to look after babies and children whose mothers are away for day's work. The mothers of these babies and children leave them in care of the institute in the morning and take them back in the evening when the day's work is done. In another part of this institute I came across a most remarkable thing. In this part the rooms were occupied by adults and children of both the sexes. When I entered there, the children were running about and making a noise. Some of the adults were chattering, increasing the noise that the children were making. Others were sitting silent. All of them were ill-clad and had the shadow of misfortune on their faces. I asked the director who they were and why they were here. The director told me that they were all families that could not pay their rent and were ejected by their land-lords. Poor creatures ! They were given shelter there by the State against the inclemence of fortune and provided with food. There is a constant influx of such families. They stay here for ten, fifteen or twenty days till a means of sustenance and housing accommodation is found for them. Here is a fact that speaks for itself.

I have mentioned only a few of the activities of Fascism. It is not possible to mention all the constructive and reconstructive activities of the regime within the brief space of an article. It may also appear that I have minimized the political and economic activities of Fascism. But the signal results achieved by Fascism in these two fields are well known. Fascism has established a sort of friendship between the political and economic activities of the State—a result which has not been achieved by any other nation and the lack of which is the cause of many maladjustments in life that we find today. During the eleven years of its existence it has placed Italy in a sound economic position. In these days of crisis the lira has maintained its sonnd position. While in other and richer countries it has

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

been found necessary to abandon the gold standard, Italy has steadily declined to do so. This is because Italy has resolutely opposed loans to foreign countries and the scarcity of Italian money outside Italy safeguards it against foreign speculation. Italian exportation also shows a tendency to increase in these days of crisis and the gold-reserve of the Bank of Italy follows an ascending curve. During these eleven years Fascism has improved all the public services and has undertaken and completed public works and works of land reclamation on a vast scale, thus diminishing the number of the unemployed. The report published recently by the English Ministry of Commerce on the economic situation of Italy says in its conclusion that the general tendency of the country is towards optimism, that the courage and firmness which Italy is showing in developing a new form of economico-social national life is admirable, that the results obtained up till now and the ideals aimed at by this great experiment deserve the greatest attention on the part of the rest of the world.

I shall conclude this article by answering one question. What has been the effect of eleven years of Fascism upon the spirit of the race? In my book on Mussolini I wrote that it was as yet early for Fascism to produce any moulding effect upon the mentality of the race. But now a generation seems to have arisen with a distinct Fascist mould of the mind. Eleven years of ceaseless effort which Fascism has made to train the race has not gone in vain. Before me lies the special number of a journal, the *Saggiatore*, in which sixty young Italian writers have expressed their views about modern civilization. Remarkable is the similarity of their tone, which reveals a vigorous breaking away from the old mentality. All these young intellectuals are imbued with the Fascist spirit of idealistic realism. If I may so express it, with that mystic, intuitive conception of life of which I have spoken before. It is significant how these young writers consider reality. Reality for them is the obstacle for transforming the spirit into something better. Reality thus loses its charm in itself and gains its value only in relation to the spirit. The conception of life thus becomes dynamic and transcendental. The ideology of man the economic being, which is the fundamental conception of Capitalism and Bolshevism, is thrown overboard and in its place is installed the ideology of the integral man—man the political being, the economic being, the religious being; the saint, the warrior. This was emphasized by Mussolini in his latest and famous discourse on corporations and the new mentality is the expression of this integral man. Here lies the essential difference between Bolshevism and Fascism. Fascism can fearlessly go all the length with Bolshevism in its economic programme if that is necessary, but in one case the fundamental conception or mentality is the continuation of the liberal theory; in the other the conception is accepted and surpassed. The rise of Fascist mentality and its projection into the world therefore means the downfall of the capitalistic and socialistic mentality. In this mentality of the young Italian intellectuals return the activism of the Roman Italy, the mysticism of the mediaeval Italy, and the political and speculative philosophy of modern Italy as developed by Vico, Cuoco, Gioberti, Mazzini, Spaventa and others. The synthetic expression of this mentality is to be found in the character and personality of Mussolini and drawing inspiration from his example this great, intelligent and laborious people, through its new generations, is moving towards a complete realization of a new and better order of things and towards creating a new national patrimony of inestimable value.

WANTED—AN INDEPENDENT INDIAN CURRENCY

By GILBERT SLATER

TWO great boons, a sound currency and liberation from external debt, are now possible for India if public opinion is alert, and the Government is wise. To establish the former is easy, if the attempt is made on right lines, and when that is done, a great step towards the latter end will have also been made.

But it must first be understood what constitutes a sound and honest currency. Just as a sound and honest measure of length, or of volume, or of mass must be one that does not vary from day to day, or from year to year, so an honest standard of value must be one that varies as little as possible from time to time, since to eliminate variations completely is not at present possible. The essential function of money is to be a standard of value. Rupees, dollars, francs, or pounds sterling, which jump up and down in purchasing power, so that the real value of a given sum borrowed may be doubled or halved between the time of borrowing and the time of repayment, are not sound and honest money.

There was a time when gold, and currencies based on gold, worked not very well, but also not very badly. The first decade of the present century was such a period. But that condition passed away for good with the outbreak of the Great War; and now the first essential for the solution of the currency problem for India is to recognize that a currency based on gold cannot be a sound currency, as it is already recognized outside India. Since the closing of the mints to the free coining of silver, Indian currency has been like a sick man suffering from some mysterious disease, round whose bed physicians from abroad have been gathered to consult and prescribe, and have damaged their own reputations in the process. Each Royal Commission and Select Committee has been unfortunate in finding its diagnosis contradicted by the event, and the wisest actions of the Government in relation to currency have been those taken in opposition to their advice. But the last, Hilton-Young Commission, ha been the most unfortunate of all.

This is not to say, however, that Indi should go back to the silver standard, an re-open the mints to the free coinage of silve Silver, indeed, would probably be a bett basis than gold, but it would not be a goo one, and India can do better.

The reformed Indian currency should b *in form*, what it is at present. It consists no of silver rupees and of Government note cashable in silver rupees—it should continu in the same form. It is a managed currenc now, it should still be a managed currenc But the management should be altere radically.

At present Indian currency is managed b the Secretary of State for India in Londo under advice which echoes the opinion of th financiers of the City of London, who are mor concerned with the interests of India's Londo creditors than with those of India, and most o all with the smooth operation of their ow money lending and money trading busines In so far as the Secretary of State proceed on any definite principle, it is that of linkin the rupee to the pound sterling. What ar pounds sterling? Merely slips of paper wi green and blue patterns printed on them, an the words "Bank of England Promise to p the Bearer on Demand the sum of On Pound"—*i.e.*, to give him back the same sl of paper, or another like it, if he presents it the Bank's counter. Subject to some measur of Treasury control, Mr. Montagu Norman an his subordinates can decrease or multiply th numbers of those "pounds" in circulatio increase or decrease their purchasing powe and consequently, that of the rupee.

It is not surprising, therefore, that Ind should be thoroughly discontented with th present system, and this discontent is th reason, I presume, why so much approval ha been given to the proposal that Indian currency should be controlled by a Reserv Bank. But this would be jumping out of th

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

frying pan into the fire. The theory that national currencies should not be controlled by the nations, or by any persons responsible to them, but by irresponsible Directors of privately owned banks, operated for private profit, is an invention of the bankers themselves, which since the war they have foisted upon ignorant politicians; and their success in so doing has been one of the chief factors in bringing about the present disastrous state of the world. The ancient principle that the monarch should be responsible for the currency is the true one. Applied to India at the present time, it means that the management of the currency should be vested in public servants, acting under general instructions issued, after careful enquiry and full debate, by the Indian Legislature. The chief aims of the management should be—

(*i*) to increase the volume of currency in circulation sufficiently to neutralize the recent slump in prices, and to bring back the price level to that of the most prosperous of recent years.

(*ii*) Subsequently, from time to time to increase further the quantity of money in circulation in proportion to the increase of population and productive power.

(*iii*) To watch movements of prices, with a view to keeping as uniform as possible the average rupee prices of commodities dealt with in India, whether imported, exported, or produced and consumed within the country.

The true function of the Indian Reserve Bank, when established, will be to *control* neither currency nor credit, but to be the Bankers' Bank, and to *co-ordinate* credit, assisting all the existing and future banks to do their business of financing Indian trade and production with greater security, efficiency and economy. It should also act with the Currency Department of the Government in giving Indian currency the elasticity required to meet the variation of seasonal demand for ready money which takes place every year.

The direct benefit of the establishment of a sound and independent currency system on the above lines, by giving encouragement and greater security to all producers, is obvious. But the indirect benefits are also great.

Firstly, as stated above, it would assist greatly in freeing India from external debt, and giving her financial independence. Since the War, international debts have increased to such an extent as to become for some nations an intolerable burden, which they have endeavoured to shake off by pleading for cancellation, by moratoria, by disguised bankruptcy, by making token payments, and even by downright repudiation. It is more and more recognized that they are injurious to creditor as well as to debtor countries, and nobody has urged this with greater force than His Majesty's Government in its notes to America. I am not advocating the application of such drastic measures to the Indian public debt.

It is urged that part of India's sterling debt represents charges unjustly laid on Indian tax-payers for purposes in which India was not concerned. I am not competent to discuss how far that is true. But it will not be denied that a great part, perhaps the much greater part, represents loans prudently and economically raised in order to provide railways and irrigation works and other public assets, and that these assets remain and are worth more to India than the money spent on them. Such debt should be regarded as a debt of honour, as well as a legal debt. But it should not be allowed to continue indefinetely, but be repaid as quickly as possible.

As soon as India determines on having a sound currency, and abandons the idea of basing her currency on gold, the gold accumulated in order to put the rupee on a gold basis becomes available for more profitable use. It amounts, we are told, to over sixty million sovereigns; which at current prices would fetch over £90,000,000. This sum could and should be used to pay off sterling debt, and with able management could probably be made also to reduce the interest payable on the remainder of that debt.

This, however, is only the beginning. Though many individual Indians have wisely used the opportunity of the enhanced price of gold to sell what they had, no doubt there yet remain even larger amounts still in Indian possession. To continue to hold is a dangerous speculation. The craze for acquiring gold to bury it in underground vaults, where it is only an expense and a nuisance, and to hoard it in other ways, still persists in Europe and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

America, but the folly of that procedure may be realized at any moment, and when these hoards are disgorged, gold will slump. Many Indians who have gold to sell will probably wish to sell while the present fancy prices last. The Indian Government should help them, by buying at the highest price which will permit it to resell in the world market without loss ; issuing rupee loans, if necessary to cover the cost, and using the sterling realized to pay off more sterling debt. In that way a part of the external debt—how much cannot be estimated—would be converted into internal debt, and the interest accruing would pass into Indian instead of foreign pockets.

Again, in order to bring up the supply of money to the amount Indian trade and industry needs for smooth working, an enlarged issue of rupees is needed, which must not only be printed, and covered to the extent necessary with silver, but must also be put into circulation. It is agreed among economists that the best way of increasing the stock of money in active circulation is to spend it on creating new public assets. India is in great need of such beneficial and profitable expenditure. In view of the development of new means of locomotion, caution should be exercised in the further extension of railways, but there is still scope in that direction. Then, beside irrigation, there is need for much capital expenditure on supply and distribution of electrical power, in improvement of roads and bridges, schools and hospitals, and many other requisities for a higher standard of life. The currency reform here advocated would enable these things to be obtained as *debt free* assets. Further, the progress in this direction would be continuous. Every expansion of currency required in order to make the volume of money increase *pari passu* with the volume of production would provide a further increase in public assets.

Every decrease in Indian external debt, and every increase in India's debt free assets, would facilitate further reductions of Indian liabilities, and free India more and more from any need to court speculative money-lenders in foreign countries. This means a higher status among the nations, and greater independence.

Lastly, in all this India would be giving a lead to the rest of the world, and helping to establish the admitted desideratum, a sound world currency. The West is trying or talking about attaining this by the mistaken policy of linking one unsound currency to another; and it is already clear that all such efforts and talk are futile. But let each nation set to work to establish its own currency on a sound basis, and the question of international exchanges will solve itself.

DAVID HARE AS A PROMOTER OF EDUCATION IN INDIA

By JOGESH C. BAGAL

THE life and works of David Hare form an important chapter in the history of education in India. In a previous article in this *Review* (January, 1933), I attempted a resumé of Hare's contributions to the cause of English education in India in the early nineteenth century. His endeavours at the education of the masses also deserve elaborate notice. David Hare* started schools in Calcutta and maintained them mostly from his own purse. His connection with the Calcutta School Book Society and the Calcutta School Society dated from their very inception

* David Hare came to India as a watch-maker. He left this business for good in 1820 as the following extract from *The Government Gazette* (Supplement) of January 6, 1820 will show :

DAVID HARE
Watch Maker,
Begs to inform his friends and the public in general that he has this day retired from Business ; and requests they will accept his most sincere thanks for the very liberal support with which they have favoured him for the last eighteen years.

He also takes this opportunity of respectfully and earnestly soliciting a continuance of their Patronage to his Successor, Mr. Gray; who came from England on purpose, and has been his Assistant for five years ; which has afforded D. H. such a knowledge of his character and abilities, that he feels the greatest confidence in recommending him on their notice.
January 1, 1820.

Digitized by Arya Samaj Foundation Chennai and eGangotri

in 1817 and 1818 respectively. He became secretary of the Calcutta School Society in 1823 and served it for more than a decade. The following extracts from contemporary newspapers will throw light on his educational activities.

A statue of Sir Edward Hyde East, the Chief Justice of the Supreme Court of Calcutta, was erected by his Indian admirers in 1830. Sir Edward was described on the pedestal of the statue as the originator of the Hindu College, the first of its kind in India to impart education in European science and literature. This led to a controversy in the Press. It was contended by many that David Hare, and not Sir Edward Hyde East, was the real originator* of the college. *The India Gazette*, a prominent bi-weekly of the time, took exception to the words inscribed on the statue of Sir Edward and wrote :

(*The India Gazette*, June 14, 1830)

A statue, by Chantry, of Sir Edward Hyde East, is about to be placed in some part of the Court House, the sanction of the judges having been previously obtained. We are informed, that the inscription on the pedestal records the original establishment of the Hindoo College, as the work of Hyde East. Now, without questioning the interest he took in the cause of native education, we positively deny that he was the originator of the institution alluded to, although he was one of its earliest supporters. Doubtless, much credit is due to so much virtue, and the natives who voted for, and subscribed to, the erection of his statue deserve much praise for their just appreciation of so excellent a friend. But let not undue merit be ascribed to any man—let not one be robbed of his reputation to erect that of another. Let the Truth be told, and it will appear that Mr. Hare was the originator, and the most active individual in effecting the establishment of the Hindoo College. He it was who first performed and induced the worthy members of the native community to subscribe towards the establishment of a fund for such an institution ; he prevailed upon them to do so ; he exerted himself to secure friends who might be able and willing to second his efforts; he got things ready into a train of operation ; he subscribed (largely, we believe,) to the fund ; the ground upon which the college now stands was sold by him at a considerable sacrifice ; he witnessed the birth of the institution, watched it in its cradle, and now that it is prospering, his zeal for its success, and attention to its interests have not abated one jot, although the charm of novelty is gone……let not Sir Hyde East, or Mr. Wilson be put upon an equality with Mr. Hare, when the disinterestedness, assiduity, and regard of each for the mental improvement of the natives are discussed. Mr. Hare is also a secretary of an institution [The Calcutta School Society] for the propagation of useful knowledge among Hindoo youth. How much is he paid for his services ? Let this be the answer. The School Society's disbursements fell short of its receipts by 6000 rupees in the year 1828 : *the deficiency was supplied* by this gentleman, whose portrait has not been painted, whose statue has not been erected.

David Hare

"A Hindoo and no lover of Mushroom

* So far as the conception of the Hindu College was concerned, the credit is primarily due to Raja Ram Mohun Roy. It was Ram Mohun who proposed orally for the first time to Sir Edward Hyde East that a college should be established in Calcutta to satisfy the modern needs of his countrymen.

Vide "Ram Mohun Roy as an educational Pioneer" by Brajendra Nath Banerji. *The Journal of the Bihar and Orissa Research Society*, June 1930. Also my article in *The Modern Review*, January 1933.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Aristocracy" further dilated on the activities of David Hare in the paper :

> There is another point, Mr. Editor, which I wish to bring to your notice. Who Mr. Hare is, what he does, and how he spends his time are questions that have not, I believe, been satisfactorily answered. You have said a great deal respecting these points, when you have mentioned that he is personally known to the three thousand boys that are attached to the School Society's Institutions, that he is also acquainted with the generality of the natives, and that there is no school in Calcutta which he does not visit. But you should have said more—from generals you should have descended to particulars. However, since you have not done so, permit me, Mr. Editor, to sketch an account of what Mr. Hare does in the course of the whole day. From ten O'clock in the morning, (the time in which the schools begin) to seven and sometimes even to eight in the evening, he visits all the native schools everyday. Enquire for Mr. Hare, during this time, and you are sure to find him in one or another school. But stop, Sir, this is but a part of what this worthy gentleman does for the good of the natives. If any of the pupils be sick, Mr. Hare prescribes Medicine, attends to him, and is not in ease, until he is quite recovered. All this I speak from my own experience. (*Ibid.*, June 18, 1830)

A rejoinder by "A Director of the institution from its very foundation" to the statements of the editor of *The India Gazette*, also reproduced in *The Hurkaru*, was published in *The Government Gazette* of June 24, 1830. It flatly denied that Hare was the originator of the Hindoo College, and that he subscribed to it. The Director wrote :

> On the [1]4th May, 1816, a very respectable Meeting of the Hindoos assembled, by the invitation, and at the House of the Honorable Sir Edward Hyde East, for the purpose of subscribing to, and forming an establishment for the liberal education of their children. Sir Edward alone addressed the meeting as to the object for which they were assembled, and as to the benefit that His Lordship considered would be derived by the country at large, from forming an establishment for the education of their youth. This proposal was explained by W. C. Blaquire, Esq. and received with the unanimous approbation of all the Natives present, including the most eminent pundits, who sanctioned it with their express support and recommendation, and a large sum of money was immediately subscribed. Under this circumstance, it clearly appears that Mr. Hare was not the originator of the Hindoo College ; nor did he subscribe to it···

He, however, added :

> In concluding this, I think it necessary to add, that it must not be supposed for one moment that I deny the merits of our much respected friend Mr. Hare, who is no doubt, a most disinterested promoter of the education of the Hindoo youths, and who devotes his whole time to further the objects of all useful Institutions established for the improvement of Natives ; and as such he is universally esteemed and admired among us, and has our warmest thanks and most sincere acknowledgements for his unwearied attentions.

The rejoinder gave occasion for the following retort from the edior of *The India Gazette* :

> Before "a very respectable meeting of the Hindoos assembled, by the invitation, and at the house of the Honorable Sir Edward Hyde East, for the purpose of subscribing to, and forming an establishment for the liberal Education of their children," had there been no such proposal in writing circulated among several native gentlemen ? Had it not been handed to Sir Hyde East by a native gentleman ? Did not that learned Judge make a few alterations in it, and approve of the proposal ? And was not the author and originator of that paper, Mr. David Hare ? Further, is it not a fact that on the occasion of an address being presented to Sir H. East by some members of the native community in which the same veracious compliment was paid to him which has since been engraved on marble, he disclaimed the honour? Let these questions be directly and explicitly answered. "A Director of the Hindoo College" may be able to favour us with something better than a *non-mi-ricordo* reply, "to remove doubts that might arise in the minds of the public." (*The India Gazette*, June 25, 1830).

In support of the editor's contention, "S" wrote a letter to *The India Gazette* on the 26th June. Part of the letter is given below :

(*Ibid.*, June 28, 1830)

> The just claim which Mr. Hare has upon the respect and admiration of those, whether European or Native, who take interest in the liberal education of the people of this country, is beyond all doubt. It may not have been so generally known that Mr. Hare is the gentleman with whom the Institution of the Hindoo College originated. This being the case, it must be universally acknowledged that public honours considered to be due, *on that*

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

account, ought to have been testified, primarily and principally, towards Mr. Hare, and not towards Sir E. H. East; who, as it appears, only seconded and gave the weight of his influence and station as Chief Judge of the Supreme Court, to a project which had been first devised by another person, to whom therefore, the credit and merit of the plan belonged as matter of exclusive right.

Mr. Hare has his time entirely at this disposal, and he devotes the *whole* of it, in the most efficient manner, to further the objects of ALL useful institutions established for the improvement of the natives, nay, more; he advances those objects by munificent donations from his private purse. No praise can be too great, no honours too high, for the man who thus exerts himself to promote the best interests of humanity, in the most comprehensive sense of that word. These tributes are due to him from the *whole body* of native gentlemen, who feel concern in securing the advantages of liberal education for the rising and for future generations: they are not due to him from any one isolated institution.

RAMMOHUN ROY'S EMBASSY TO ENGLAND

By BRAJENDRA NATH BANERJI

RAMMOHUN sailed for England on 15th November, 1830, and reached Liverpool in the April following. The foremost thought which occupied his mind there was the mission from the King of Delhi. He explained his object in visiting England in a long letter addressed on 25th June, 1831, to the Chairman and Deputy Chairman of the East India Company. He wrote:

"I have the honour to acquaint you that one of the principal objects of my visiting England is to lay before the British authorities, if found necessary, a representation with which I am charged from His Majesty the King of Delhi, and more especially a letter from His Majesty to the King of England,* which letter it will be my duty to take an early opportunity of presenting in the event of the appeal which I am induced in the first instance to make to the Hon'ble Court of Directors not being attended with success.

I would beg to state on the present occasion that I possess full and unlimited powers from His Majesty to negotiate and agree to a final settlement of what the King considers to be his fair and equitable claims on the Hon'ble East India Company. The circumstances connected with the appeal are stated in a pamphlet printed for greater facility of perusal and reference, a copy of which I now beg to submit herewith...."

It is our intention to reproduce here the pamphlet mentioned above which was hitherto unknown to the biographers of Rammohun. This document, it will be seen, exhibits Rammohun's great forensic ability and was printed in London in 1831 for private circulation. I have discovered a copy of it among the Home Miscellaneous Series Records of the India Office and this will also be included in the collected edition of Rammohun Roy's works shortly to be published by the Bangiya Sahitya Parishat, Calcutta.

TREATY WITH THE KING OF DELHI DECISION THEREON

By the Governor-General of India With Remarks on the latter

Original Treaty with His Majesty the King of Delhi, entered into in 1805, by the Local Government of Bengal, consisting of the Marquis of Wellesley and the Members of the Supreme Council.

Decision passed by Lord Amherst, Governor-General in Council, on the Articles of the above Treaty in 1828, in consequence of frequent demands on the part of His Majesty for its fulfilment.

Treaty

1. "All the Mehals (districts) to the west of the Jumna, situated between the west and north of Mouza Kabilpoor, shall be considered the crown-lands of His Majesty."

Decision

1. As to the requests concerning the 1st and 8th articles of treaty, Government states, "that it was the original intention of Government to have assigned certain Mehals to the west of the Jumna, for the support of His Majesty and the Royal Family: but the plan was never, from unavoidable causes, carried completely into effect, and in 1809 the royal stipend was fixed at one lack per month."

Remarks on the Decision

By the use of the word "intention" in this paragraph, His Lordship conveys the idea that the assignment of these districts was a mere inclination or suggestion in the breast of the Local Government, which it was at liberty to act on or not. Now, when in consequence of an intention, a promise is made, if even verbally, on which other parties are

* For a copy of this letter see my monograph on *Rammohun Roy's Mission to England*, pp. 51-65.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

induced to rely, the party promising becomes bound to fulfil it. But when that intention and promise have assumed the solemn form of a written contract or treaty, on the faithful observance of which the honour and character of the contracting party depend, and such treaty has even been reduced to practice for years, is it possible to regard the conditions of such a treaty as a mere 'intention,' which the party stipulating it is at liberty either to fulfil or not as it may suit his interest or convenience? Not only was this engagement formally embodied in a treaty regularly executed and recognized in the regulations or statutes of the British Indian empire, which are printed and circulated all over the country as the laws by which it is governed; but it was acted upon for some period after it was made; and it was afterwards repeatedly recognized in subsequent enactments of the government, which spoke of it as a Treaty which had been entered into, and was still in full force. For the evidence of this, see Sections 1st and 3rd of Regulation VIII. of 1805, which states, "that the revenues of the territory on the right bank of the Jumna are assigned to His Majesty Shah Alum." At Sections 1st and 2nd of Regulation X. of 1807, and at Section 1st of Regulation XI. of the same year, the language is similar though more general; for in these "the territory assigned for the support of the Royal Family at Delhi," is mentioned without specifying its locality as in the former instances, the very absence of this specification marking its notoriety, and the distinctness of the purposes to which the revenues of that territory were exclusively applicable.*

As a further proof, if such were necessary, of the actual cession of the territory for that purpose in pursuance of the Treaty, the King of Delhi was allowed to appoint his own accountants in conformity with the 3rd article of it, to attend at the offices of the Collector of the revenue to keep an account of the amount received, and report the same to him, that the royal treasury might not be deprived of any part. This they did for some years; after which, when the revenue realized, began to exceed very considerably the minimum stipulated and paid to His Majesty, his accountants were dismissed as inconvenient. On being informed that the revenues of the crown-lands had increased greatly, His Majesty applied for an augmentation of stipend; and Lord Minto directed the sum of 13,000 rupees to be added to His Majesty's personal allowance in addition to 60,000 previously received, both together not amounting to more than 73,000 rupees, which is very far short of one lac or 100,000 rupees, the sum which would be supposed from the above statement. This augmentation was made, however, without the least reference to His Majesty, and with a total disregard to the provisions of the Treaty by which it ought to have been much greater: against which injustice His Majesty never ceased to complain to all the Residents at his court, and also personally to Lord Amherst when his Lordship visited Delhi in 1827.

Treaty

2. "The management of these Mehals (districts) shall be continued according to custom in the hands of the Resident."

Decision

2. "Requires no answer."

Remarks

Virtually admitting that the territory continued under the control of the Resident, who, as sole manager thereof alienated and exchanged various parts of it.

Treaty

3. "For His Majesty's satisfaction, the Royal Mootusuddies (accountants) shall attend at the Cutchery (collector's office) to keep accounts of the receipts and disbursements, and report the same to His Majesty."

Decision

3. "The Governor General is not aware of any advantage which could result from the enforcement of this article; as the maintenance of Mootusuddies (clerks) of the several Cutcherries (collector's offices) in the Delhi territory must obviously be an useless and unprofitable source of expense to His Majesty which it would be better to avoid."

Remarks

Were they dismissed, after several years attendance, from a kind regard to His Majesty, and to save him from the expense of them, as his Lordship here intimates? or with the view of concealing from His Majesty a knowledge of the amount of revenue justly due to him in terms of the treaty, but which it was now more convenient to withhold from him!

Treaty

4. "Two Adauluts (courts) one for Dewanee (civil) and the other for Fouidary (criminal) business shall be established, and all matters coming before them shall be decided according to the rules of Mahomedan law."

Decision

4, 5, and 6. "The British Government distinctly reserved to itself the right of introducing such modifications as it might deem expedient and necessary into the system originally established for the management of the assigned territory, and it has exercised that discretion in the instances here referred to."

Treaty

5. "Two learned and respectable inhabitants of Delhi shall be appointed to the offices of Cazee (judge) and Mooftee (lawyer) in the above courts."

6. "In every criminal case where the punishment of mutilation or death may be adjudged by the officers of the Foujdary (criminal court) the papers will be submitted by the Resident to the King for His Majesty's decision."

Remarks

The British Government might introduce modifications into the mode of regulating its Courts established by these articles; but a disregard of the provision in article 6, cannot be called a modification but a violation of the treaty.

Treaty

7. "The sums specified below shall be paid monthly by the Resident from the public treasury for the expenses of His Majesty and the Royal establishment, whether the whole of the amount or is not collected from the Khalsah (or crown lands.

* By a reference to the regulations, it will be found that the regulations above quoted, are still in force and not rescinded.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

DECISION

7. "No answer required."

REMARKS

There is in fact no complaint of any violation of this article (fixing at first the minimum allowance) but rather that the Government adhered to it, with too great a tenacity after its operation had been superseded by the increase of the revenue produced by the assigned territory.

TREATY.

8. "Should there be an increase in the collections from the above Mehals (districts), in consequence of extended cultivation and the improved condition of Ryots (cultivators) an augmentation to that amount will take place in the King's Peshcush (tribute)."

DECISION.

8 "Noticed above (par. 1)"

REMARKS.

No specific answer is given to this, because it is unanswerable, and proves, beyond all question, that the King's monthly tribute (then fixed at a minimum of 60,000 rupees) was to increase in proportion as the revenues of the crown-lands improved. Yet notwithstanding the vast increase that has taken place in the revenues, now more than trebled, the above tribute has only been increased 13,000 rupees.

TREATY.

9. "The Resident will present 10,000 rupees on the occasion of each of the seven festivals held annually, *viz.*, two Eeds, the anniversary of the Accession, the Now Roze (new year's day), the Holy Rumzan, the Hooly, and Bussunt."

DECISION.

9. "The presents here referred to, were commuted long since for a monthly payment of Rs. 6000 which amount was added to His Majesty's stipend."

REMARK.

Even this arrangement was made without the previous consent of His Majesty.

TREATY.

10. "The Jagheers (estates) of the heir apparent and Mirzah Aizedbukhsh, situated in the Doab, shall be made over to the officers of the Honourable Company."

DECISION.

10. "Requires no answer."

REMARK.

The fulfilment of this rested with the Resident and Aizedbukhsh, etc.

TREATY.

11. The expense of the Troops, Police Corps, etc. employed in the Khalsah (or crown-lands) shall be defrayed by the Honourable Company.

DECISION.

11. "The expenses here alluded to have been always defrayed by the British Government."

REMARKS.

The obvious meaning of this article is, to satisfy the King that this expense of troops, etc., was to be defrayed by the Honourable Company, and that they were not to be maintained at His Majesty's expense, or become a charge upon the produce of the crown-lands, so as to diminish in any degree the amount of their revenue which was stipulated and exclusively due to His Majesty.

In short, when by increased cultivation the revenues of the crown-lands augmented considerably above the fixed minimum, the Local Government began to regret that the treaty should operate more favourably for His Majesty than was at first expected, and felt less reluctance to violate a treaty with a fallen dynasty, than to part with a considerable sum of money.

In order to remove an objection which might have been made by some illiberal men, that allowing of an increase of revenue to the King would be contrary to sound policy, it may be added that His Majesty has agreed, in a letter to the British Sovereign, never to retain in his treasury more than twelve lacks of rupees (about £120 000 sterling) at one time, and to forfeit any sum beyond that which may be found in his possession; and that he will invest in the Honourable Company's funds any surplus beyond the twelve lacks, should such exist.

He has also given a solemn promise under his hand to one of his confidential servants, that if any surplus exists beyond what is absolutely required by the actual necessities of himself and family, he will employ it in establishing seminaries of education throughout his territories.

SUMS ALLUDED TO IN ARTICLE 7TH OF THE TREATY.

"Detail of the fixed Peshcush (tribute) and other allowances, per Mensem,"

"For His Majesty"	Rs. 60,000
"The Heir apparent, exclusive of the Jaghgeer (estate) of Kote Cassim"	Rs. 10,000
"Mirza Aizedbukhsh (*viz.* on account of Doab Jageer) 1000 Peshcush."	Rs. 2,000
"Princes and Princesses, each"	Rs. 200
"Salary of Shah Newaz Khan"	Rs. 2,500

As the Local Government of Bengal in their letter to the Honourable Court of Directors in 1828, ground the above decision on the Report of Sir Charles Metcalfe dated June or July, 1827, it is therefore necessary to subjoin this Report, in so far as it relates to the Treaty in question, with remarks on each paragraph, to enable the reader to form a judgement how far this report can afford any degree of support to such a decision, or justify the direct violation of the Treaty.

REPORT OF SIR CHARLES METCALFE.

Observations on the Report of the Hon. Sir Charles Metcalfe dated July 1827, then Resident at Delhi, and recorded by the Local Government of Fort William in July 1827, on which the resolutions of Government in 1827, refusing to adjust the claims of the King of Delhi are founded, as is evident from its despatches to the Court of Directors, of July 1828, and May, 1829.

1. **Report.**—The 1st, 2nd, 3rd and 4th paragraphs of Sir Charles Metcalfe's Report, containing no arguments, do not require comment.

2. Sir Charles Metcalfe states in the 5th paragraph of his Report, "that it seems impossible to ascertain to what district" (the Mehals assigned in the first article for the support of the royal family) "are applicable"; and again in the 6th paragraph of the same Report, that "respecting the document" (the written agreement entered into by Government

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

with his Majesty in the year 1805), "it may be remarked that it is an intimation of the intentions of the British Government at that time, and not an engagement positively binding as to its future conduct."

3. **Remarks.**—With a view to asceratain how far these statements are correct, I may refer to the document alluded to—*viz.*, a Treaty permanently concluded with His Majesty in 1805, by the Marquis of Wellesley, as well as to the concurrent spirit and words of several regulations of the Supreme Government, passed in subsequent years. With regard to the district which it seems to Sir Charles Metcalfe impossible to ascertain from the terms of the Treaty, as assigned to His Majesty, the specification appears pretty distinctly stated in the words of the lst article of the Treaty alluded to, which are as follows:—

4. Article lst. "All the Mehals to the west of the river Jumna, lying between the west and the north of the Mouza of Kaboolpoor, *are fixed*, as the Khalsah Shureefah, or *Crown-lands* of His Presence or Majesty."

5. Again, that this article was conformable to the deliberate intentions of Government, appears clearly from the words of Section 4th, of Regulation XI of 1804, the year *previous* to the final conclusion of the Treaty, where it is most clearly expressed, "that the revenues of the territory on the right bank of the Jumna are assigned to His Majesty Shah Alum;" and we find precisely the same language used at Section 22nd of the same Regulation, wherein it is laid down that certain articles imported by sea are exempted from duty, on their exportation to the territory on the right bank of the Jumna, the revenues of which *are assigned to His Majesty, Shah Alum;*" at Section 35 of the same Regulation, it is also ordered that salt imported into the Zillahs, or "from the territory situated on the right bank of the Jumna, the revenues of which *are assigned* to His Majesty, Shah Alum, shall be subject to a duty." At Section 3rd of Regulation VI of the succeeding year, the same expression as to the assignment of the revenues on the right bank of the Jumna to His Majesty Shah Alum is used; and at Sections 2nd and 4th of Regulation VIII. of the same year, it is enacted that the "laws or regulations of the British Government, printed and published in the manner prescribed in Regulation I. of the year 1803, are not to extend to the territory on the right bank of the Jumna, the revenues of which are *assigned* to His Majesty Shah Alum." That the British Government continued in the *intention* of acting in the spirit of the Treaty of 1805 is equally manifest from the fact that, in 1807, the fourth year after the first announcement of the aforesaid territories being assigned to His Majesty, Shah Alum, and the third year of the Treaty of 1805, the same language is used, though in a more extended sense. It is enacted in Sections the lst and 2nd of Regulation X of 1807, "that territory assigned for the *support* of the *Royal Family* at Delhi," shall be excepted from the superintendence of a commissioner appointed by the Supreme Government to superintend the settlement of the revenues, and for the general control of the collectors. And again, in Section lst of Regulation IX. of the same year, it is ordained that "the territory *assigned* for the *support* of the *Royal Family at Delhi*" shall be exempted from the ordinances framed in this Regulation.

6. After these incontestible proofs that the boundaries of the Crown-lands in question are most distinctly laid down and the appropriation of the revenues thereof to the support of the Royal Family deliberately, fully and unequivocally set forth, during a period of four years—*viz.* 1804, 1805, 1806 and 1807, and so late as the latter year, 1807, these territories were entitled," the lands assigned for the support of the Royal Family at Delhi," it is rather unaccountable that Sir Charles Metcalfe should think it "impossible to ascertain to what district the territory was applicable," or to believe that the Treaty itself, and the provisions cited from the Government Regulations for a period of several years are to be construed as "merely intimations of the intention of the British Government."

7. It may not be considered superfluous if I quote, in this place, the language of the 10th paragraph of Sir Charles Metcalfe's Report, as indicative of the inconsistency of the honourable gentleman; for he there admits the identity of the district which he sets out with declaring the impossibility of ascertaining. He says, "these instructions declare that the territory to be assigned for the support of His Majesty is to comprise all the territory on the right bank of the Jumna, to the northward of Kaboolpoor, *ceded* to us, by the Treaty of Surjee Angengaum."

8. **Report.**—In the first part of the 7th paragraph of the same Report, Sir Charles Metcalfe states, that "it will be easy to shew that this Treaty was not deemed binding for any, the shortest period, that it was scarcely written before it was virtually annulled, and that the British Government never did intend to enter into any compact with His Majesty."

9. **Remarks.**—This assertion is equally unaccountable as the former one, and it is quite sufficient to refer to the quotations alreay offered from Regulation XI. of 1804. Regulation VI. and VIII. of 1805, and Regulation X. and XI. of 1807, for the most undeniable proof that the assignment of the territory in question, was not only held valid, "for any, the shortest period," but publicly announced, and officially recognised, for several years, as the Khalsah lands, the revenues of which belonged to the Royal Family of Delhi.

10. **Report.**—In justification of the delusion which according to Sir Charles Metcalfe, the British Government put on the world, as well as on the King of Delhi, by the apparent liberality of the Treaty of 1805, he alleges, at the conclusion of the 7th paragraph of his Report, that "the British Government never did intend to enter into any compact with His Majesty, who, having in fact come into the hands of the British Government, without power or possessions, had nothing to confer in return for the benefits which he received and was not master of the materials for mutual negotiation, or treaty."

11. **Remarks.**—My remark on this paragraph is, that the only reciprocal advantage which could be derived from a cession to His Majesty, at the period of the first British conquest of the western provinces, consisted in the greater stability to the power of the British Government, attained by securing the grateful friendship of a monarch, who, though without territorial possession, was still regarded by the nations of Hindoostan as the only legitimate fountain of either honour or dominion. The assignment, even of a small slip of territory, to the acknowledged Emperor of India, was, in the circumstances of the times, eminently calculated to ensure the popularity of the English nation, and, in common with several other acts, was strongly illustrative of

CC-0.In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the wisdom and foresight that characterised the policy of the administration of the Marquis of Wellesley. I may, moreover, observe, that to this Royal Family the British nation stood indebted for their original legal settlement on the banks of the Ganges, and consequently, for their subsequent gradual territorial acquirement of almost the whole of Hindoostan. And further, His Majesty, Shah Alum, in the year 1765, then an independent sovereign and the universally acknowledged monarch of the whole of Hindoostan, readily granted to the Hon. East India Company, at the solicitation of their representative, Lord Clive, with other privileges and immunities, the Dewanship, in perpetuity, of such fertile territories as Bengal, Behar, and Orissa. It cannot, I presume be considered an over-excess of liberality, or favour, that the representative of his Britannic Majesty should in the full plenitude of power, and after the conquest of a most extensive country, have granted a comparatively minute portion on the bank of the river adjoining the royal city of Delhi, for the maintenance of that personage and his family, who was, from their first landing in India, the firmest friend and ally of the English nation.

12. And with reference to that part of Sir Charles Metcalfe's statement, that "the British Government never did intend to enter into any compact with His Majesty," who, in fact, according to the honourable gentleman, fell into their power, I may refer to a part of the Marquis of Wellesley's letter to His Majesty at Delhi, dated the 27th July, 1803, and subsequently communicated to the Secret Committee of the Hon. East India Company, under date 12th April, 1804, which clearly shews that His Majesty was induced to place himself under the protection of the English nation, by reason of the earnest solicitation of the British Government itself, and on account of the repeated promises made to His Majesty by the representative of that government, as to "permanent arrangement, calculated to provide durable security for the happiness, dignity, and tranquillity of His Majesty and the Royal Family."

13. The language of the Supreme Government of India, in their letter to His Majesty, as above referred to, dated 27th July, 1803, is as follows :—

"Your Majesty is fully appraised of the sentiments of respect and attachment which the British Government has invariably entertained towards your Royal person and family."

"In the present crisis of affairs, it is probable that your Majesty may have the opportunity of again placing yourself under the protection of the British Government, and I shall avail myself with cordial satisfaction of any event which may enable me to obey the dictates of my sincere respect and attachment to your royal house."

"If your Majesty should be disposed to accept the asylum which, in the contemplation of such an event, I have directed His Excellency, the Commander-in-Chief of the British Forces in Oude to offer to your Majesty, *in the name of the British Government*, your Majesty may be assured, that every demonstration of respect, and every degree of attention which can contribute to the ease and comfort of your Majesty and the Royal Family, will be manifested on the part of the British Government, and that adequate provision will be made for the support of your Majesty, and of your family and household."

"At a proper season, His Excellency the Commander-in-Chief will have the honour of communicating to your Majesty my further sentiments on the subject of the proposed arrangement."

(Sd.) J. MONCTON,
Asst. Pers. Sec. to Government.

14. Notwithstanding these solemn promises made to his Majesty, "*in the name of the British Government*," by the Marquis of Wellesley, the King boldly and candidly expressed his doubts as to the sincerity of the professions of the Governor General in Council in the following terms :—

"The English have for some years past, been unmindful of me ; conceiving therefore, lest when the English gain possession of the country, they may prove forgetful of me, it becomes necessary for the General to settle this point with the Governor General, that *hereafter* there be no want of obedience, or cause of dissatisfaction to me."

(Sd.) J. GERARD.
Aug. 29, 1803

15. With the intention of still further refuting the statement of Sir Charles Metcalfe, that "the British Government *never did* intend to enter into any compact with his Majesty," I may here quote an extract from a letter addressed by His Majesty, Shah Alum, to the Marquis of Wellesley, dated 5th October, 1803, and which His Excellency, General Lake, "did not hesitate entirely to approve."

"Be this great victory and splendid success happy and prosperous to us, and to all the servants of our illustrious court, especially to your Lordship."

"As the designs of our faithful servants have now happily succeeded, the time is now arrived for your Lordship, in *conformity* to the *distinct* and *obligatory engagement described to us by your Lordship*, in the letter which you lately transmitted, to secure to yourself happiness, temporal and eternal, and permanent reputation, by *fulfilling that engagement*, and *to carry into effect* that which may provide for the interest and welfare of the servants of this Imperial Court (meaning His Majesty and family), and for the happiness of the people of God, through the aid and services of the officers of the Company's Government."

"For the rest, consider our boundless favour to be extended towards your Lordship, in a daily increasing degree."

(A True Translation.)
(Sd.) W. B. BAYLEY,
Asst. Pers. Sec.

16. **Report.**—In the 8th paragraph of the honourable gentleman's report he states, that, in November, 1804, the following declaration was made by the Governor General :

....."the Governor General does not deem it advisable to enter into any *written* engagement whatever with his Majesty, nor is it His Excellency's intention to solicit any concession, etc."

17. **Remarks.**—As to this expression of the sentiments of the Governor General, I can only say, that it is obviously inconsistent with subsequent public acts, and with the previous declaration of the Governor General in Council, in a letter to His Majesty, Shah Alum, dated 8th October 1803, as follows :—

"My attention is now directed with great solicitude to the formation of a permanent arrangement calculated to *provide durable security for the happiness, dignity*, and *tranquillity* of your Majesty

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

and Royal Family, *conformable to the intimation* contained in my former address to your Majesty."

"I trust that the testimony of my early attention to your Majesty's service may be acceptable to your Majesty, until His Excellency, General Lake, under my orders, can be enabled to *offer* to your Majesty's *consideration*, the plan of a *permanent settlement of your affairs*, secured by the *power* of the *British Government*."

"I request your Majesty to consider His Excellency, General Lake, to be fully authorized by me to conduct all affairs in Hindoostan, and to possess my entire confidence and highest resp ct."

"Your Majesty will, therefore, be pleased to signify your commands on all occasions, to General Lake with the same confidence by which you have honoured me; and your Majesty will also be pleased to accept all communications from General Lake, as proceeding immediately from my authority."

(A true copy).

(Sd.) W. B. BAYLEY,
Asst. Pers. Translator.

18. As I have no means of ascertaining the peculiar circumstances out of which the declaration quoted by Sir Charles Metcalfe may have arisen,—Whether it was the act of the Governor General in *Council* (which is not stated), or the personal suggestion of the Governor General,--it is inconceivable to me that any stress whatever should be laid upon it by Sir Charles Metcalfe. If admissible to prove anything, it can only be to shew that the policy of entering into a written treaty with the King, which appeared at one time expedient, was afterwards, on more mature deliberation, embraced and acted upon, and held forth to the world as a matter that reflected honour on the British name.

19. **Report.**—The only part of the 9th paragraph of the report requiring observation, is the assertion, "that a fixed stipend should be assigned to His Majesty, payable in ready money, out of the revenues of our territory on the west of the Jumna."

20. **Remarks.**—In commenting on this, I have only to refer to the 8th article of the Treaty alluded to where, as plainly as words can declare anything, it is affirmed, that "should there be an increase in the collections from these Crown-lands, in consequence of extended cultivation, and the improved condition of the Ryots, in *augmentation* to that amount will also take place in the King's stipend." By these words it is most obviously indicated, and without a shadow of doubt expressed, that the stipend for the support of the Royal Family at Delhi, was not to have a perpetual limitation, but was to be increased in proportion to the augmented revenue of the Crown lands, and that the fixed stipend allotted to His Majesty in 1805, was merely a temporary arrangement, in consequence of the unsettled state of the country, as is evident from the words of the 7th article of the Treaty, as follows:—"Whether the amount be or be not collected from the Khalsah Mehals (or Crown-lands), the Resident will pay in monthly, in ready money, to the royal treasury, the sums fixed and particularized below, that the servants of the Sacred Presence may suffer no inconvenience for expenses."

21. **Report.**—The 10th paragraph of Sir Charles Metcalfe's report states: "These instructions declare that the territory to be assigned for the support of His Majesty is to comprise all the territory on the right bank of the Jumna to the northwest of Kaboolpoor, ceded to us by the treaty of Surjee Angengaum."

22. **Remarks.**—Requires no comment, as I have adverted to it in my remarks on the 5th and 6th paragraphs. This acknowledgment by Sir Charles Metcalfe is in confirmation of the justice of His Majesty's claims upon the revenues derivable from the said lands.

23. **Report.**—Paragraphs 11, 12, 13, 14 and 15, of the same Report state that "a large portion of those territories" (*i. e.* the Crown-lands assigned to His Majesty), were alienated to various individuals by the R sident in the latter end of the year 1805, and beginning of the year 1806; that, that alienation was in a great measure executed, and took place without reference to the previous assignment of those lands to the King, from which premises Sir Charles Metcalfe infers, that "it is quite clear that no such treaty was *supposed* to exist between the British Government and the King of Delhi."

24. **Remarks.**—Supposing the alienations alluded to had taken place, and that His Majesty had made no attempt to oppose them, it should be remembered, that by the 2nd article of the Treaty, it was provided that "the management of the Crown-lands was to be continued, according to custom, in the hands of the Resident," by which very proviso, His Majesty was precluded from interfering in any of the arrangements which the British Resident might deem fit to adopt, and the alienation of portions of those lands to any individuals by the Resident, or the annexation of others was equally beyond the control of His Majesty. In fact, from the whole tenor of the Treaty, the King considered himself as merely entitled to the revenues of his Crown-lands, without any right to interfere in their settlement, or to take an active part in their collection. The British Government could not surely evade its obligation to the King, by the expedient of alienating, *i. e.*, diverting the collection of the revenue into another channel.

25. **Report.**—The 16th and first part of the 17th paragraphs of the Report state, that the Crown-lands assigned to the King are now included in the central and northern divisions of the Delhi territory, and that the whole revenue, after paying the civil establishments only, is about 9,25,000 rupees.

26. **Remarks.**—It is clear from this statement that a sum of not less than 9,25,000 rupees, is at present the public revenue arising from such part of the Crown-lands as still *remain* under the immediate management of the Resident, after the extensive alienations to other individuals by the Resident since the Treaty of 1805. Those alienations having taken place without consent of His Majesty, he cannot reasonably be required to suffer by the acts of another person, who was, by virtue of the Treaty, entrusted with the sole management of the whole of the Crown-lands; His Majesty is therefore, consistently with the pure spirit of justice, entitled to the whole of the income, derivable from the territory assigned for his support, by the engagement of the British Government in 1805.

27. **Report.**—Sir Charles Metcalfe thus concludes his 17th paragraph, "these divisions contain *considerably more territory* than were in the possession of the British Government at the settlement of affairs in 1806."

28. **Remarks.**—His Majesty, as I have observed in the preceding remark, was and still remains

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

incapacitated by the Treaty, from interfering in the administration of the Crown-lands, and consequently is ignorant of the manner in which *considerable acquisitions* have been made by the Resident in the Delhi territory since the final settlement with His Majesty in 1805 ; and I have only to observe, that although some portions of land may have been alienated by the Resident on one side of the Delhi territory, without the consent of His Majesty, yet it is admitted that much larger acquisitions have been made by the same gentleman on another, though unknown to His Majesty.

29. **Report.**—The 18th paragraph of the Report states, that enough has been said to shew the meaning of which the first article of the Treaty is susceptible, that "it was never acted on by the British Government ; that the article from the commencement has, in fact, been null and void for every purpose, but that of providing His Majesty with a liberal stipend, without reference to the revenue of the territory once designated, assigned, but which designation has long since ceased and become *obsolete*."

30. **Remarks.**—The singleness of meaning of which the 1st article of the Treaty is alone susceptible, can by no means be perverted by any subsequent interpretations ; and from my quotations from the Government Regulations, it is obvious that no attempt ever was made to represent the Treaty of 1805 as "null and void, or set aside" until the year 1809, when it appears that the British power being so firmly established in India, as to enable it to disregard popularity in the western and other provinces, and to encounter with impunity public odium—the necessary consequence of a manifest breach of faith—the public officers endeavoured to render a Treaty (which had been solemnly and voluntarily entered into) "*obsolete*."

31. **Report.**—Paragraphs 19th, 20th, and 21st, after repeating that "the 1st article of the Treaty of the 23rd May 1805, merely indicated an intention of the British Government, which was never fulfilled," proceed to state, that "a part of the instructions" to the Resident from the Supreme Government (which was withheld from the knowledge of His Majesty), "produces the impression that the intention ascribed to the article in question was not even at that time (1805) entertained ; for it is stated that if the revenues of the assigned territory shall hereafter admit of it, the monthly sum to be advanced to His Majesty, may be increased to one lack of rupees ;" which limitation Sir Charles Metcalfe observes "is inconsistent with any intention that the whole of the net revenue of the territory" (after the improved cultivation), "should go to His Majesty ;" and that, although this paragraph was never communicated to His Majesty by the Resident, yet it may *now* with propriety be cited, as a means of ascertaining the real intentions of the Government with regard to the Treaty of the 23rd May 1805, although they even (the intentions of the instructions) "were *not* carried into effect," and the honourable gentleman is further of opinion, that the *intentions* of the Supreme Government, although they were overlooked in the Treaty with His Majesty, may *now* be brought forward for consideration, because the treatment of the King of Delhi by the English nation was "gratuitous."

32. **Remarks.**—In the first place, it is evident from Sir Charles Metcalfe's own statement, that a part of the instructions from the Supreme Government to the Resident, concerning the Treaty of 1805 which states, that "should the revenue of the assigned territory hereafter admit of it, the monthly sum to be advanced to His Majesty might be increased to one lack of rupees," was never communicated to the King, and consequently it cannot *now* be urged as a reason for violating the Treaty of 1805, which was solemnly contracted, and publicly announced, and recognized in the regulations of Government. Had that part of the instructions concerning the Treaty been communicated to His Majesty, and notwithstanding he had agreed to the articles of the Treaty, this circumstance might probably by some persons be evasively adduced, for the purpose of weakening the claims of His Majesty. I say *evasively* ; because even that part of the instructions which was withheld from His Majesty by the Resident, (and which declares, that in the event of an increased augmentation in the revenue of the Crown-lands, the personal royal stipend should be increased to one lack of rupees monthly,) does not affirm, that in the event of the progressive improvement of the Crown-lands beyond one lack monthly, nevertheless, the stipend should remain fixed at that sum. I might also, by a parity of reasoning, according to the arguments used by Sir Charles Metcalfe, assert that the intentions entertained privately by the Government in 1805, had in fact "become null and void from having never been carried into effect, or having been shortly set aside" by the public execution of the Treaty of 1805 ; but I refrain from resorting to such a mode of argument, and I feel myself not transgressing the bounds of decorum and respect when I assert, that by representing the Supreme Government as capable of wilfully withholding from His Majesty, a portion of the public instructions concerning the Treaty of 1805, a gross deception is, in addition to a breach of promise, imputed unintentionally to the British Government by the honourable gentleman. And if anything could possibly render the Treaty more binding, it would be, its having been (as Sir Charles Metcalfe states), "*voluntarily* and *gratuitously* entered into," and solemnly ratified by the representative of His Britannic Majesty. I have considerable pleasure in being enabled to corroborate this opinion by the disinterested testimony of one of the ablest and most honourable of the Bengal civil servants. Mr. Alexander Ross, who was, for some years, the representative of the British Government with the King of Delhi, and who has candidly observed in an official communication to his Government, that "as this statement" (now brought forward by Sir Charles Metcalfe), "was never communicated to His Majesty Shah Alum, it cannot with propriety be *now* cited," as indicative of any intentions entertained by the Government in 1805, against the claims of His Majesty.

33. **Report.**—The 22nd paragraph of the Report, in giving the view most favourable for Government, admits, that "an increase of 40,000 rupees per month was contemplated beyond the amount of stipend then granted (*i.e.*, in the year 1805), and that the increase which has since taken place is not fully to that extent."

34. **Remarks.**—This admission, partial as it is, evinces the justness of at least, a portion of His Majesty's demands for the arrear of the stipend due to him for his support, and proves the violation both of the Treaty of 1805, and the intentions of the Government, upon which Sir Charles Metcalfe principally dwells.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

35. **Report.**—The 23rd paragraph of the Report states, that "the obligation which the British Government had imposed on itself, was that of providing adequate means for the support of the King and his household, in a manner suitable to the condition in which he was placed; while in policy it was inexpedient that the provision granted should exceed an amount sufficient for that purpose."

36. **Remarks.**—The obligation which the British Government imposed on itself, was fully set forth in the Treaty of 1805; and had they deemed the appropriation to His Majesty of the total amount of the revenue, arising from the improved state of the Crown-lands, as being at all impolitic or likely to give rise to alarms (however ill-founded), prejudicial to the Supreme Government, the latter had it completely in their power to demand or enact any honourable and suitable stipulations they deemed requisite; such, for instance, as His Majesty has now voluntarily proffered of not keeping in his own possession more than a certain sum of money at a time, and investing, in the East India Company's treasury, the remainder of his revenue (which might occasion the entertaining of fears unworthy of his fidelity).

37. **Report.**—In the 24th paragraph Sir Charles Metcalfe states that "it has been contended" (by Mr. Ross the late representative at the Court of Delhi), "that these are not reasons which can be urged for not fulfilling the promises supposed to be contained in the Treaty of 1805." But the honourable gentleman nevertheless is of opinion, that the reasons he has already adduced have shewn that the said Treaty "was virtually annulled almost as soon as it was formed; that it was not at any time a stipulation; that the territory to which it related was for the most part alienated within a few months from its date; and that the whole revenue of what was reserved would not nearly pay the present allowance to the Royal Family."

38. **Remarks.**—As I have clearly demonstrated in the preceding remarks, that the Treaty was not, as Sir Charles Metcalfe states "virtually annulled almost as soon as it was framed;" that the Treaty of 1805 was a stipulation voluntarily and deliberately entered into with His Majesty by the British Government; that the alienation of a part of the territory assigned as the Crown-lands of His Majesty, was an act with which the King had no power to interfere, the administration and management of the said lands being entirely in the hands of the British Resident, according to the 2nd article of the same Treaty; and that, consequently, the amount of revenue arising from the lands which the Resident retained or gave away to others, is still due to His Majesty, the opinion expressed by Mr. Ross stands valid and unimpeached.

39. **Report.**—The 25th paragraph of the Report states, that "it appears that it was the intention of our Government at that early period (*viz.* in 1805), to assign a territory for the support of the Royal Family; and fixing the stipend at a certain amount to pay the deficiency of the revenue from the Company's treasury. It is not *quite clear*, because different parts of the Resolution are not consistent with each other, whether it was intended that the King should enjoy any amount of revenue that might accrue from the territory to be assigned, or that his stipend should be limited to the *maximum* mentioned as what might be given, if the territory should ever yield so much. The settlement of this point is of the less consequence, as the territory mentioned in the Resolution was for the most part alienated, and not assigned."

40. **Remarks.**—The admissions in this paragraph, though mingled with doubt by Sir Charles Metcalfe, are not a little remarkable, after the train of reasoning previously adduced by the honourable gentleman, with a view to shew that such an intention could not have been contemplated by the British Government; for, observes the honourable gentleman in the 15th paragraph of his Report, "it is quite clear that no such engagement (as the Treaty of 1805), "was supposed to exist, and the only notion entertained at that time was, that the King was to be pensioner of the British Government, who were to take care of him by a handsome provision, and that all the territory in our possession was at our own disposal." However, the doubt expressed by Sir Charles Metcalfe might perhaps have been suggested by the articles of the instructions to the Resident in 1805, which, in the honourable gentleman's opinion are "inconsistent with each other." To an impartial judge, no inconsistency or want of explicitness will, I think, be observable in the articles of the Treaty which were presented to the Emperor Shah Alum in 1805, so the instructions of Government to the Resident appear quite consistent with each other, though the last article was not explicitly expressed by Government; as is fully explained in my observation (Par. 32) on the 19th, 20th, and 21st paragraphs of the Report. The alienations to other individuals by the Resident, of a portion of territory assigned to His Majesty, which may have been caused by some unforeseen circumstances, and which took place without the consent of the King, cannot be adduced as weakening the claims of His Majesty to the whole of the revenues of the territories assigned to him, or justify the charge which the honourable gentleman has brought against the Supreme Government, of *inconsistency* in its resolutions.

41. **Report.**—The 26th paragraph of the Report states, "that the only principles acted upon by the British Government with relation to the stipend of the King of Delhi" were, "that the stipend of His Majesty should be liberal and suitable to his condition; but that it should be fixed and limited according to the exigencies of the Royal Family, and the available resources of the British Government," and Sir Charles Metcalfe states, that he "does not see why it should depart from those principles, with reference to a doubtful construction of an intention which, whatever it may have been, was laid aside almost at the moment when it was conceived."

42. **Remarks.**—My observation upon this paragraph is, that the principles which actuated the Supreme Government could only be divined from their solemn engagement and public announcement of them, and these are entirely in favour of the right which Sir Charles Metcalfe is pleased to term "a doubtful construction."

43. **Report.**—The 27th paragraph asserts that "there is no want of reason for believing that the real intention of the resolution of May 1805, was that the King's stipend should be fixed, it evidently not being at that time supposed possible that the revenue of the Delhi territory could increase to so great a degree as to admit of a payment greater than the limited allowance *ultimately* contemplated."

44. **Remarks.**—By a reference to the 7th and 8th articles of the Treaty entered into with the King of Delhi by the British Government in 1805, it

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

evident (and so far I agree with the honourable gentleman), that the stipend of His Majesty should be limited to a certain amount, only so long as the revenue arising from the Crown-lands assigned for the support of the Royal Family, did not exceed the sum then allowed; but that, as soon as the revenues should exceed that stipend in any degree, a proportionate increase should take place in the Royal stipend. This positive declaration or fact, cannot be altered by the supposition of Sir Charles Metcalfe, that the promise made by Government to augment the Royal stipend, in proportion to the increase of the territorial revenue, was founded upon an erroneous calculation, that the revenue of the Delhi territory could not possibly "increase to so great a degree as to admit of a payment greater than the limited allowance *ultimately* contemplated." I have admitted this supposition of the honourable gentleman for a moment, although it is unsupported by any official document that I am aware of; but I may be permitted to inquire, Does not national honour bind the Government to the fulfilment of a solemn compact, deliberately entered into, even if a part of its engagement rested on a calculation which might hereafter be supposed not to come up entirely to the expectations of one of the contracting parties? Were a contrary mode of reasoning to be adopted in any, the most trifling domestic or social agreement, the confidence between man and his fellows would be irretrievably destroyed. Indeed, I can scarcely persuade myself, that the honourable gentleman could have reflected, when he adverted to this supposition, which if admitted as a just rule in one instance, would be a fair precedent for the supreme Government to lay aside the obligation into which they entered with the Zumeendars of Bengal and Behar, in 1793; on the plea, that their lands, the assignment of which was rendered permanent in 1793, now yield a greater revenue than was contemplated at that time.

45. **Report.**—In the 28th paragraph Sir Charles Metcalfe states, that he "cannot concur in the opinion which has been expressed" (by Mr. Ross, the Government Agent at Delhi, in 1823), "that the Resolution of 1809 is to be considered invalid, because it does not agree with the seeming intention of a prior period," which the honourable gentleman again states, "was never carried into effect."

46. **Remarks.**—As the honourable gentleman has not brought forward any argument in support of this difference of opinion with Mr. Ross, except such as have been noticed by me, in the preceding passages, I am unavoidably necessitated to refer to my remarks upon the same assertions in the 6th paragraph. (*Vid.* par. 3-6, page 8-10, supra.)

47. **Report.**—In the 29th paragraph it is stated that, "although the King has often applied for an increase of stipend there is nothing on record," within the knowledge of the honourable gentleman, "heretofore indicative of His Majesty's desire to have his stipend regulated by the amount of revenue produced by the Delhi territory."

48. **Remarks.**—Sir Charles Metcalfe here admits His Majesty's having often applied for an increase of stipend, but asserts that he had no knowledge of any document being on record, indicative of the desire of the King to have his stipend regulated by the amount of revenue derivable from the Crown-lands. It must be sufficiently obvious, that the applications made by His Majesty for an increase of stipend, could be alone founded on the 8th article of the Treaty of 1805, which provides for the regulated extension of His Majesty's stipend, by "the amount of revenue" accruing from the anticipated extended cultivation of the Crown-lands, and the improved condition of the cultivators.

49. Sir Charles Metcalfe frequently adverts in the foregoing paragraphs of his Report, to the remarks made by Mr. Ross, in his communication to Government, dated the 13th of June, 1823, wherein Mr. Ross expresses His Majesty's desire to have his stipend regulated by the amount of revenue produced in the Delhi territory. This circumstance of Sir Charles Metcalfe's adverting to the communication in question, shews that the honourable gentleman must have read this official document, communicating the desire of the King to have his stipend increased, in proportion to the augmentation of the revenues of his Crown-lands. I have, therefore, to regret, that this fact should have escaped his advertence, when the honourable gentleman stated that there was nothing hitherto on record to that effect. Indeed, for the first two or three years succeeding the Treaty of 1805, His Majesty made no application to Government for an increase of stipend, in consequence of the unsettled state of the country; but at the time of the administration of Lord Minto, in 1809, His Majesty renewed his application for an increase of stipend, and incurred considerable expense in deputing an Envoy to Calcutta, to represent his claims; as is evident from the minute entered by that nobleman in the same year. But to the great surprise of His Majesty, he was informed, that the Governor General in Council had made a partial augmentation to his stipend, without reference to the enhanced revenue derivable from the Crown-lands assigned for the support of the Royal Family; though his Lordship, being aware of the unjustness of the measure, expressed in his minute, that the arrangement of the Government would prove dissatisfactory to the King. His Majesty finding he could not procure an adjustment of his claims from Lord Minto, waited the arrival of his successor, the Marquis of Hastings; and being unable to afford the expence of another Envoy to Calcutta, awaited the expected visit of the Marquis to His Majesty at Delhi. This interview was, however, prevented by an unforeseen and unfortunate obstacle, and the preferring of His Majesty's demands to the Governor General himself, was necessarily postponed until Lord Amherst assumed the reins of Government, when, on his visit to Delhi, the King again advanced his claims, and his Lordship referred them to Sir Charles Metcalfe, for his opinion on their validity. From this brief recital, to say nothing of the perpetual complaints made to the Resident, it is clear, that although considerable delay has been unavoidably incurred in bringing forward His Majesty's appeal against the wrongs which His Majesty suffered from Lord Minto, yet the insinuation that His Majesty has only lately preferred a new demand against the British Government, will be perceived to be perfectly unfounded.

50. **Report.**—The 30th paragraph of the Report states, that "it was the expressed intention of the Marquis of Wellesley's Government, in May, 1805, to increase the *personal stipend* of His Majesty, to 100,000 rupees per month, whenever the territory assigned for the payment of the royal stipends should yield a net revenue adequate to the supply of the proposed increase." But the honourable gentleman offers his opinion that, "that intention was superseded by the arrangement concluded in the Earl of Minto's administration, in 1809." It is moreover stated, "that the King's *personal allowance* at present, is 82,200

rupees per mensem, exclusive of lands which Sir Charles Metcalfe imagines "yield more than 5000 rupees per mensem, and 2000 rupees which the King appropriates from the allowance assigned for the Heir-apparent." Sir Charles Metcalfe, therefore, conceives, "the difference to be less than 10,800 rupees," while the honourable gentleman admits that, "by another calculation, it may be 16,800 rupees per mensem." In support of Sir Charles Metcalfe's conception—*viz.*, that it is 10,800 rupees a month, which fall short of the promised personal stipend, and not 16,800 rupees a month, the Report states that "*it is not clear*, that the personal stipend of 100,000 rupees per mensem, was to have been exclusive of allowance for festivals, commuted afterwards to 6000 rupees per mensem, and if not, the difference will be only as first stated—*viz.* '10,800 rupees ;' the Nuzzurs presented to His Majesty by the British Government, exceeding, it is supposed, 1000 rupees per mensem, are not included in the statement, nor those which His Majesty receives from the natives of all ranks."

51. **Remarks.**—It cannot escape the notice of every reader of this Report, that Sir Charles Metcalfe has unequivocally admitted, that it was "*the expressed intention*" of the Marquis of Wellesley's Government in 1805, to increase His Majesty's personal stipend to 100,000 rupees per mensem, whenever the territory should yield a "net revenue adequate to the supply of the proposed increase." But the opinion offered by the honourable gentleman, that "this arrangement was superseded by an act of Lord Minto's administration, in 1809," is unsupported by argument, and inequitable in its effect ; since the obligatory and voluntary arrangement made during the administration of the illustrious Marquis of Wellesley approved of by the Court of Directors, and the British Parliament by which the British faith was irrevocably pledged to the Royal house of Timour, could not be "superseded," or "set aside," by the act of any ulterior administration, or Government, without a direct and public violation of national faith, and a sacrifice of the unstained honour of the British name. This obligatory arrangement with the Royal house of Timour was so far considered binding, that although Lord Minto practically infringed thereon, yet having no power "to supersede" or set aside a solemn compact made by his predecessor, and guaranteed by the British Government, he gave such a colouring to his resolutions on the subject, as should make it appear that he was intent on fulfilling the engagement entered into by the Marquis of Wellesley, in 1805 ; for his Lordship, in a minute, dated 17th June, 1809, in stating his reasons for augmenting the Royal stipend, observes that this measure "is expedient, with reference to a conditional promise to that effect, made with Shah Alum, in 1805, and to fulfil the obligation of the public faith."

52. These expressions of Lord Minto appear to have made the intended impression on the Court of Directors ; so that, in their letter dated 4th September, 1811, they did not scruple to admit, that "the period had arrived at which it became incumbent on the British Government, to fulfil the promise made by Lord Wellesley, on the part of the British Government to the King of Delhi, and Royal house of Timour."

53. I may also be permitted to point out the inconsistency which is displayed in the 30th paragraph of the Report ; for, after stating, that the *personal stipend* of His Majesty was intended to be increased to 100,000 rupees monthly, the honourable gentleman states, that "it is not *quite clear*" that this sum was exclusive of the allowance for festivals, afterwards commuted to 6000 rupees per mensem. I am at a loss to comprehend, how Sir Charles Metcalfe, who is distinguished for his accurate knowledge of diplomacy and Court affairs, should for an instant imagine that *allowances* for *festivals* and Court ceremonies, were meant to be included in a "personal stipend."

In every document relating to the public affairs of His Majesty, the amount of money assigned for public festivals, is separately set forth, and in no instance does it appear, that an idea was ever entertained by the Government, of consolidating this most indispensable branch of Court expenditure, with the *personal stipend* of His Majesty : nor can I perceive the object which Sir Charles Metcalfe had in view, when introducing the subject of the Nazzurs given to His Majesty by the Resident, and "by the natives of all ranks :" I trust the honourable gentleman did not also mean to include those sums in the personal allowance for the King.

In justice to His Majesty's claims, it may be now fairly advanced, that the arrears due to His Majesty for his personal support alone, are 40,32,000 rupees even according to the admission of Sir Charles Metcalfe, calculating at 16,800 rupees a month, from the year 1809 to the present period.

54. **Report.**—The 31st paragraph adverts to the state of the Hon. East India Company's treasury and observes, that "if it were overflowing with surplus revenue, the increase of the comforts of the Royal family might be a fair object for liberal consideration." But even then, observes Sir Charles Metcalfe, "the pinched situation of many of the Sulateen (relatives of the King), *much more urgently* requires relief."

55. **Remarks.**—The plenitude, or otherwise, of the treasury of the Hon. East India Company, does not in the most remote degree affect the lawful claims of His Majesty, who seeks no favour, but justice. And here Sir Charles indirectly admits the justice of His Majesty's claims ; but pleads the inability of the Company to meet them. The remark on "the pinched situation" of some of the Royal family, which Sir Charles Metcalfe here acknowledges is most probably founded on his personal experience and, I doubt not His Majesty will be highly pleased to see the British Government manifesting its compassion towards them, and alleviating their distress. All that His Majesty wishes is, that relief should be rendered them, but not at his expense.

56. **Report.**—The 32nd, 33rd, and 34th paragraphs of the Report, remark on the net revenue of the Delhi territory (under the present boundary after the several alienations), which Sir Charles Matcalfe is of opinion, would scarcely pay the monthly stipend of 100,000 rupees, if the expenses of the maintenance of the troops and Government were to be included, and the honourable gentleman asserts that the maintenance of the troops was plainly indicated, if ever the revenue should be adequate to it, by the following extract from the notes of instructions to the Resident in 1804 (the year previous to the Treaty which was signed by Lord Wellesley) "the total designated amount of the provisions for the King, (is) to include the estimated expense of a force to be permanently stationed at Delhi, for the protection of that city, and of His Majesty's person ; but the amount to be assigned for the actual maintenance of His Majesty and the Royal Family, is not to be *affected* by the *fluctuation* in the charge of the force."

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

57. "The only meaning" says Sir Charles Metcalfe, "to be attached to this passage, seems to be, that the expense of the troops is to be paid from the territory assigned, but that the King's stipend is to be fixed, and not to be diminished, if the expense of the troops exceed the estimate, nor to be *increased*, if the expense fall short of the estimate."

58. **Remarks.**—In remarking on these paragraphs, I must first observe, that even if the private instructions to the Resident in 1804, were to be considered as valid, yet I do not think that the interpretations given by Sir Charles Metcalfe are conclusive. By the words said to have been contained in the instructions to the Resident in 1804 (His Majesty's stipend shall not be affected by the fluctuation in the charge of the force), Government meant to secure the certainty, for the time being, of the stipend assigned to His Majesty, that it might not be affected by the number of troops quartered in the Delhi territory. But I can by no means acquiesce in the conclusion drawn therefrom, that, by preventing the fluctuation arising from rapid and uncertain charges, the personal allowances of His Majesty were intended to be permanently limited; since by the 11th article of the Treaty of 1805, it is stipulated, "that the expense of the troops, police corps, etc. in the Delhi territory, shall be defrayed by the Hon. Company."

59. **Report.**—The 35th paragraph states, that "it may be said that the *intentions* of 1804 were superseded by *those* of 1805, and were not acted on; so also the intentions of 1805 were not acted on, but were *immediately* set aside, and were finally superseded and abrogated by the arrangement of 1809."

60. **Remarks.**—Whatever were the *intentions* of the Governor General in 1804, which Sir Charles Metcalfe adverts to, they are to me unknown, and being, as the honourable gentleman observes, merely *intentions*, and not acts, cannot, of course, be adduced in support of the honourable gentleman's opinions; besides, these alleged "intentions," are directly at variance with the correspondence (and obligatory promises therein contained), between His Majesty, and the Marquis of Wellesley, and Lord Lake, in 1803, quoted in my remarks on the 7th and 8th paragraphs, (*vide* par. 13, page 12, supra) and also negatived by the regulations of the Supreme Government, in the year 1804, and several succeeding years, and by the Treaty of 1805.

61. In pursuance of the *intentions* of Government in 1805, there was an actual written engagement, confirmatory of these intentions, ratified by the representative of the British nation, and personally presented to His Majesty by the English Resident at the Court of Delhi: an engagement, be it remembered, which was executed by the local Government of India, confirmed by the Court of Directors of the Hon. East India Company, and approved of by the British Parliament; as well as publicly announced and promulgated in the regulations of the Supreme Government, for several succeeding years. Therefore, the Local Government had not in 1809, or at any period, in its power "to supersede and abrogate" an engagement thus solemnly and deliberately sanctioned by the highest authorities in Great Britain, without violating every principle of justice, and dissevering every tie by which national faith and honour are secured.

62. Sir Charles Matcalfe, in the 36th, 37th, and 38th paragraphs of his Report, thus proceeds to sum up his previous arguments against the validity of His Majesty's claims to an increase of the Royal stipend. 1st "It is not certain what the intention of 1805 was; whether to limit the King's stipend to a fixed amount, or to give him the net revenue of a territory." In reply to which I have only to observe, that the honourable gentleman must have overlooked the 1st, 7th, and 8th articles of the Treaty, while making the above assertion; for, in the aforesaid articles, it is, as I have previously stated, most fully and clearly expressed, that a certain territory "is fixed as the Crown-lands of His Majesty;" that the Royal stipend should be paid, whether the full amount of that stipend was or was not collected by the British Resident, from the said Crown-lands; and that when the revenues of them increased, His Majesty would receive a proportionate augmentation in his stipend.

63. It is, moreover, unaccountable how Sir Charles Metcalfe could have expressed this doubt, after having previously affirmed, in the 27th paragraph of his Report, that "there is no want of reason for believing that the real intention of the Resolution of May, 1805, was, that the King's stipend should be fixed."

This, as well as many other similar inconsistencies of opinion, exhibited in the honourable gentleman's Report, is strongly indicative of the insurmountable obstacle which the justice of a cause, based on facts, opposes to all the attempts at perversion that the best talents are capable of suggesting.

64. The second clause in Sir Charles Metcalfe's summary, is "There is strong reason to believe, that the utmost contemplated, in any event, was the maximum of fixed stipend, mentioned at that time." It is evident by the 7th article of the Treaty, that, owing to the fluctuating state of the revenue in the Crown-lands, during and for some time succeeding the war, a *minimum* allowance was assigned to the Royal Family, payable out of the Government treasury; and it is equally certain, by the plain language of the 8th article of the Treaty, that the stipend of the King was not to be limited to any maximum, but to be increased in proportion to the "extended cultivation and improved condition of the Ryots," in the Crown-lands of His Majesty.

65. The third clause of the summing up of the Report, is as follows:—"Supposing the net revenue of the territory to have been meant, without limitation as the amount of the stipend, it is not clear that it was settled what really constituted net revenue, and what expenses were to be included or excluded, with reference to the charges to be borne by the territory; although it is manifest, that in 1804, the expense of the troops was considered as a charge to be borne by the territory."

66. It is not a matter of supposition, but a substantiated fact, that the *entire* revenue of the Crown-lands of His Majesty, were appropriated by the Treaty of 1805, to the use of the Royal Family, and whatever might have been the intention of the British Government in 1804, as to the charges to be borne by the Crown-lands, it is fully stated in the 11th article of the Treaty of 1805, that "the expense of the troops, police corps, etc., employed in the Crown-lands, shall be defrayed by the Hon. East India Company."

67. The fourth clause of the summary observes, that "whatever was the intention of May, 1805, it was never acted on." Having in the preceding passages commented fully on this assertion, I shall merely state, that the substance of the Treaty of 1805, was *acted on*, as is evident from the Regulations of Government, quoted in my remarks on the 6th paragraph (*vide* par. 5, page 9, supra), by which

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

"the territory on the banks of the Jumna, the revenues whereof are assigned to His Majesty," were exempted from the imposition of certain customs and laws, &c. Moreover, the language of the 43rd, 44th, and 49th paragraphs of Sir Charles Metcalfe's Report, are most palpably at variance with the unqualified statement in the summary, and my quoting them here will leave me quite free from the necessity of further demonstrating the incorrectness of the honourable gentleman's assertion.

68. In the 43rd paragraph of Sir Charles Metcalfe's Report, it is affirmed, that the 5th article of the Treaty of May, 1805, "May be said to be in force;"—again, in the 44th paragraph of the same Report, that "the operation of the 6th article has been long discontinued;" and again, in the 49th paragraph of his Report, the honourable gentleman asserts that "the 11th article" of the Treaty "has been fulfilled by us."

69. The 5th clause of the summary states, that "the territory specified as to be assigned to the King, was given away to other Chiefs, and what was reserved of it, was beyond measure inadequate to defray the expense of his stipend." In reply to which, I have already observed in my remarks on the 11th and 17th paragraphs, that according to the 2nd article of the Treaty of 1805, the management of the Crown-lands continued to be vested in the British Resident at Delhi, solely, and any alienations or acquisitions made by that officer, were according to his discretion, and cannot, therefore, for a moment, be supposed to invalidate the lawful claims of His Majesty, who, according to the terms of the Treaty, is entitled to the revenues arising from the Crown-lands, and not to the possession of them.

70. The 6th clause of the summary states, that "the Royal stipends continued to be paid, without reference to the amount of revenue."

I am at a loss to conceive what inference Sir Charles Metcalfe intends to be deduced from this statement; for surely the honourable gentleman does not mean to inculcate the principle, that an infraction of an engagement, solemnly, deliberately, and publicly contracted, can justify in the most remote degree, its continued violation.

71. The 7th clause of the summary observes, "a final arrangement was made in 1809, by which an increase was allowed, and by which the *assurances* before held out to the King, were considered both by the Government in India, and by the Hon. the Court of Directors to be sufficiently fulfilled."

On this repeated assertion of Sir Charles Metcalfe's, I have only to observe, that the arrangement of 1809, was directly at variance with the unequivocally expressed articles of the Treaty of 1805, executed by the Local Government of India, confirmed by the Hon. Court of Directors, and approved of by the British Parliament, as well as directly opposed to "the expressed intention of the Marquis of Wellesley's Government in 1805" according even to the honourable gentleman's own statement.

If the arrangement of 1809, ever met with the sanction of the Hon. Court of Directors, it must have been caused by the misrepresentation of the Local Government; as is evident from the language used by the Hon. Court, in their letter, dated 4th September, 1811, in which they state that "the period had arrived at which it became incumbent on the British Government to fulfil the promise made by Lord Wellesley, on the part of the British Government, to the King of Delhi, and the Royal Family of the house of Timour." I may also here safely assert, that it was not in the power of the Hon. Court of Directors, much less of the Local Government, to preserve good faith, and yet to annul a solemn engagement, entered into on the part of the British nation, unless they would be justified in publicly avowing their contempt of all engagements and their disregard of the sanctions of Parliament, and that nothing can bind them to the fulfilment of a sacred promise, but their own temporary interest or the expediency of the moment.

72. The 8th clause observes, "If in consequence of the apparent increase of revenue in the Delhi territory, it be proposed to revert to such parts of the intention of 1805 as related to the assignment of territory, it must be recollected that the present southern division of the Delhi territory was not included in the assignment then contemplated, and that other districts which were then included, do not now form a part of the Delhi territory."

With reference to this statement I can merely reiterate as before, that the acquisition or alienation of territory to or from the Crown-lands by the Resident, was perfectly independent of His Majesty's the management of the said Crown-lands, according to the 2nd article of the Treaty, being placed at the entire disposal of that gentleman.

73. The 9th clause states, "It is remarkable that the present revenue of the Delhi territory, after defraying the charges of local civil administration amounts nearly to the sum proposed in the liberal arrangement contemplated in 1804, *i. e.*, 30 lacks, out of which the military establishment also was to have been paid; and if the same plan were now adopted it would not produce any increase to the King's stipend."

Sir Charles Metcalfe has here apparently overlooked the 11th article of the Treaty of 1805, by which "the expense of the troops, police corps, &c. employed in the Crown-lands" was stipulated "to be defrayed by the Honourable Company"; otherwise the honourable gentleman would not have supposed, that out of 30 lacks (the revenue of the Delhi territory, after defraying the local civil administration) "the military establishment also was to have been paid."

74. In the 37th paragraph, Sir Charles Metcalfe thus concludes his summary. "On the whole there does not seem to be sufficient reason to deviate from the plan that has been really acted on by the British Government." I should not be surprised if the Local Government were to persist in pursuing the plan they have hitherto adopted, though manifestly in violation of their sacred and obligatory promise; but it does not appear to me at all probable, that the British Government will for an instant sanction so direct a breach of faith as the violation of an engagement which was guaranteed to the Royal house of Timour by the moral and political integrity of the English nation.

75. In the 38th paragraph, Sir Charles Metcalfe offers the following concluding observations: "It would be very *inconvenient* at present to have to increase the stipend, and I do not conceive that such great an exigency exists as to render it necessary." The honourable gentleman also observes, that "the *greatest exigency*, as before remarked, is with reference to the scanty allowances of some of the Sulateen."*

76. I cannot help here admiring Sir Charles Metcalfe's candour in assigning *inconveniency*, as the real reason for the infraction of the Treaty of 1805

* Relations of the King.

Digitized by Arya Samaj Foundation Chennai and eGangotri

thereby tacitly admitting the justice of His Majesty's claims, but making the restitution of his rights a question of expediency. It was certainly found *convenient* or politically necessary by the British Government in 1805, to assign the revenues of a certain portion of land for the support of the King of Delhi and the Royal Family of Timour; but the honourable gentleman is of opinion, that it is now "very *inconvenient*" to adhere to the engagement thus solemnly promised and ratified; I am, therefore, anxious to know whether in his estimation, justice and conscience ought to be made subservient to *convenience?*

77. Sir Charles Metcalfe does not deny the distressed situation of His Majesty, but supposes that "the *greatest exigency*, as before remarked (in his 31st paragraph), is with reference to the scanty allowances of some of the Sulateen."* Notwithstanding the repeated professions of attachment and respect of the British nation towards the Royal house of Delhi and the promises made to His Majesty "in the name of the British Government" (as quoted in my remarks on his 7th paragraph), wherein it is stated, that "every demonstration of respect, and every degree of attention which can contribute to the ease and comfort of His Majesty and the Royal Family, will be manifested on the part of the British Government, and that adequate provision will be made for the support of His Majesty, his Family and Household" (*Vide*, par. 12, page 12, supra), I deeply regret that the Local Government should have so entirely overlooked these national and solemn obligations; and that, although the "pinched situation of many of the Sulateen" has been brought to their notice by the British Resident at Delhi, so long ago as June 1827, that, nevertheless, no measures have been taken for the alleviation of their distress; and an appeal to their humanity has met with the same reception as an application to their justice.

The wrong done to His Majesty, the King of Delhi, by the continued violation of the Treaty, became at last so glaring, that in 1823, Alexander Ross, Esq., the Agent of the Governor General at Delhi, felt bound in conscience, to state his view of it (however disagreeable this might be to his superiors) in the form of a letter to the Governor General in Council, through the Persian Secretary's Office, which I here subjoin :*

THE TEMPLES AT NEMAWAR

A. C. BANERJI

NEMAWAR or Nemawoor is a small village in the dominions of His Highness the Holkar of Indore. Lying between 22°30′ N., and 77°3′ E. the hamlet is picturesquely situated on the north bank of the river Narmada, and is mentioned by the celebrated Muslim traveller Al-Biruni as an important ford of the river.* *The Indore State Gazetteer* mentions the existence of a Jain temple at this place. But the temple is a Hindu shrine, and there are also remains of another Hindu temple. A description of these two temples appeared in *Progress Report of the Archæological Survey of India*, Western Circle, for the year ending 31st March, 1921. The late Mr. R. D. Banerji also published an account of the temples in Bengali.†

The bigger temple at Nemawar is complete, and with the exception of some slight modern additions on the roof of the *mandapa* it has not suffered any damage or undergone any alteration during the eight hundred years of its existence. The temple is dedicated to Siva, and is called by the local people as Siddhanatha or Siddhesvara temple. The materials with which the temple was built are sandstone of different colours. The *garbhagriha* and the *sikhara* of the temple were built of yellowish sandstone. The plinth of the *mandapa* to the height of 1′3″ was built of the same material, but the upper part was built of bluish sandstone. The late Mr. R. D. Banerji was of opinion that the *mandapa* and *arddha-mandapas* were probably later additions. The building materials were probably obtained locally; the sandstone quarries of Ghatia, Katkut, and on the banks of the Kanar river are even now used by the

* Sachau—*Al-Biruni's India*. Vol. I., p. 203.

† *Masik Basumati*, 1331 B. S., pp. 722-33. The present contribution is based on both these publications.

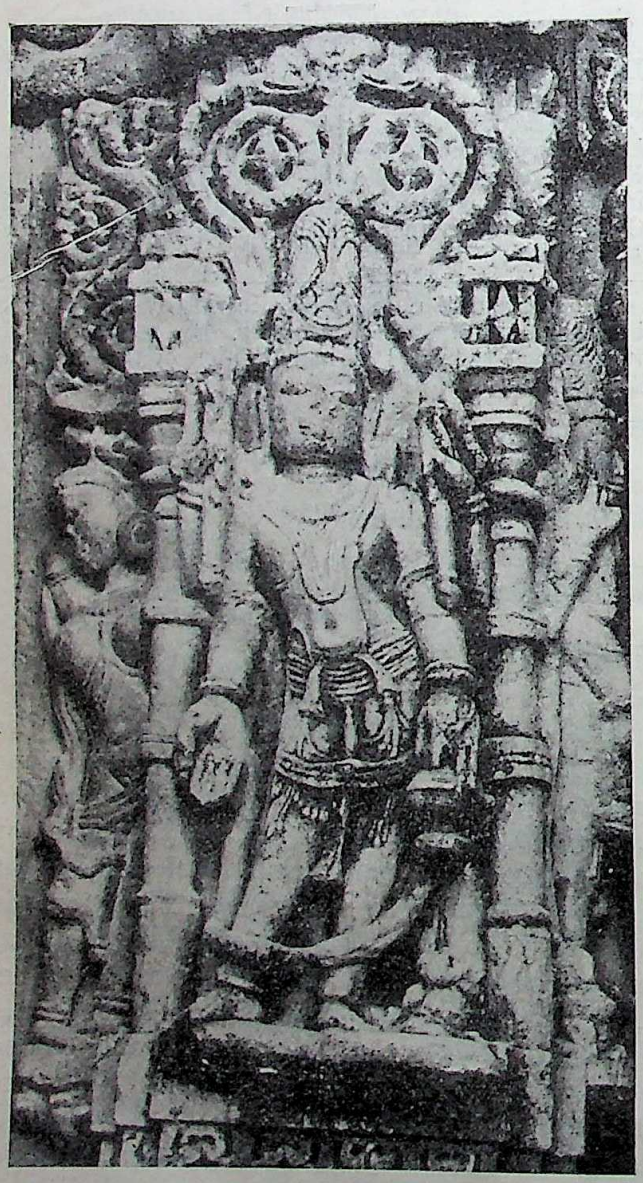
State authorities. The temple of Siddhanatha-Mahadeva consists of a *sabha-mandapa*, and the *garbhagriha* surmounted by curvilinear *sikhara*. The temple was built on the river bank over a massive stone platform, and was surrounded by a rampart with bastions at regular intervals. The paved courtyard is irregular in shape. Thanks to the munificience of Maharani Ahalya Bai the deity is still worshipped daily.



Sculptures on the wall of the *garbhagriha*

Mandapa

In plar the *mandapa* is a square with porches projecting on three sides. Each of these porches rests on four small pillars. The dome of the *mandapa* is supported by ten small pillars, four on sides and two in front. The pillars bear high niches containing semi-divine figures. The intermediate space between the smaller pillars of the *mandapa* is filled with fine stone *jali* work. On each side of the projecting porches are stone benches without back rests. Below the level of these benches the external surface of the walls of the *mandapa* bears elaborate sculptural and other decorations, the principal feature of which is a beautiful dado consisting of two horizontal bands of carvings. The lower band only 8″ in height consists of a row of niches alternating with sunken panels. They contain seated male or female figures. Above this is the bigger row of about 2′2″ in height with alternating niches and sunken panels as the lower one. The panels contain female figures, while the niches bear divine or semi-divine figures. Below the pillars on each side of the porches there are large niches containing divine figures. The two pillars of the porch facing south have the following figures grouped below them :— (1) Brahmani, (2) Kali, (3) Karttikeyani, (4) Vaishnavi. On the south-eastern corner of the *mandapa* we find an image of Brahma, while in the south-western corner there is an image of Mahadevi. In a niche by its side we find a male figure whose indentity is problematical. The figure is seen standing near a man lying on his stomach, and has a seven-headed serpent above his head. It holds a dagger and a thunderbolt in its left hands, and a shield with its upper right hand, while the lower right hand is broken. In the absence of the plough and the drinking bowl it cannot be regarded as an image of Balarama. Below the pillars of the western porch we find the following images :—(1) dancing Ganesa with six hands, (2) a male figure with eight hands and the lion as his *vahana*, (3) Varuna. The images below the pillars of the eastern porch are all new, and need not be taken into our consideration. The pillars of the porch on the northern side have the following figures :—(1) Indrani, (2) Chamunda, (3) Parvati.

Dome

No account of the *sabha-mandapa* would be complete without a description of the

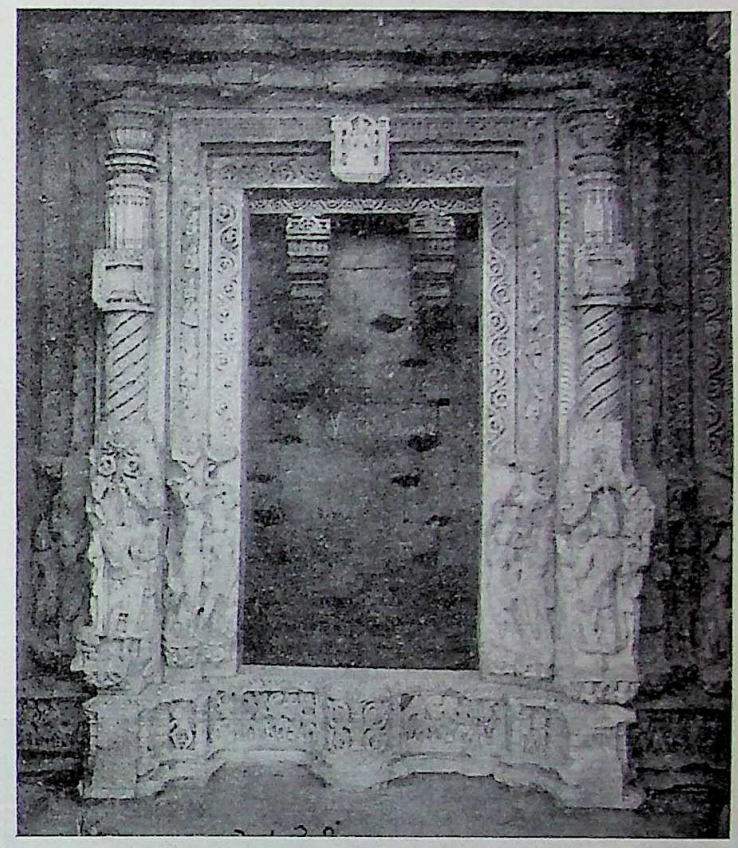
CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

magnificent dome that adorns it. Twelve pillars (two large and ten small) of the *mandapa* support the main frame of the dome. The first frame is a square made by four huge horizontal beams. Eight niches containing divine figures are found on these beams. The square frame in its turn supports an octagonal frame formed by cutting of the corners of the square frame by stones laid across. On the surface of these stones were carved huge *kirttimukhas*. Over this was placed a sixteen-sided frame, supported by sixteen brackets with female figures (*apsaras*) in relief. From this frame the concentric circles of the trabeate dome begin. The dome is elaborately carved with pleasing designs, and there is a long delicately carved pendentive hanging from the centre of the dome. Domes such as this one were once a common feature of ancient Jaina and Hindu temples of northern and western India. The dome of the Delvada temple at Mt. Abu was built on the same principle as this one, and the dome of the Siddhanatha temple may be compared with those of Vastupala temple at Girnar, and Vimala and Tejahpalas temples at Mt. Abu.*

Antarala and the Door

Antarala is the passage which connects the *sabha-mandapa* and the *garbhagriha*. The ceiling of the *antarala* of the Siddhanatha temple bears five inverted, fully blossomed lotuses. The door frame which is remarkable for its beauty, consists of eight bands of vertical carvings, and three horizontal bands. The first one is a meandering creeper design with a female figure below. The second is a row of flying figures, and the third a single row of lotus petals. The next is a fine pillaster in high relief at the middle of which we find a pot with foliage hanging down its two exposed sides. The portion above the pot is fluted, while the lower part of the shaft bears a screw and spot design. This type of pillasters are generally found in temples built during later mediæval period, but so far as I know, this is the first time that it is found in a temple of 11th century A. D. It stands on an hexagonal base below which



Door frame of the unfinished temple of Vishnu

we find a male figure, probably a *Sivagana*. The next band consists of a row of human figures with clasped hands. The next one is a meandering creeper, and then double rows of lotus petals. Three of the bands are carried overhead horizontally, at the centre of which is a small niche containing an image of Ganesa. Above the third band is a projecting cornice, over which is a big horizontal beam devided into nine compartments. The central compartment bears an image of Siva with four hands, two of which hold a *vina*, and the remaining left and right hands hold a *damaru*, and skull cap. The Bull which is the *vahana* of Siva is also depicted. The other eight niches contain the images of Brahmani, Mahesvari, Karttikeyani, Vaishnavi, Varahi, Indrani, Chamunda and Mahadevi.

Garbhagriha

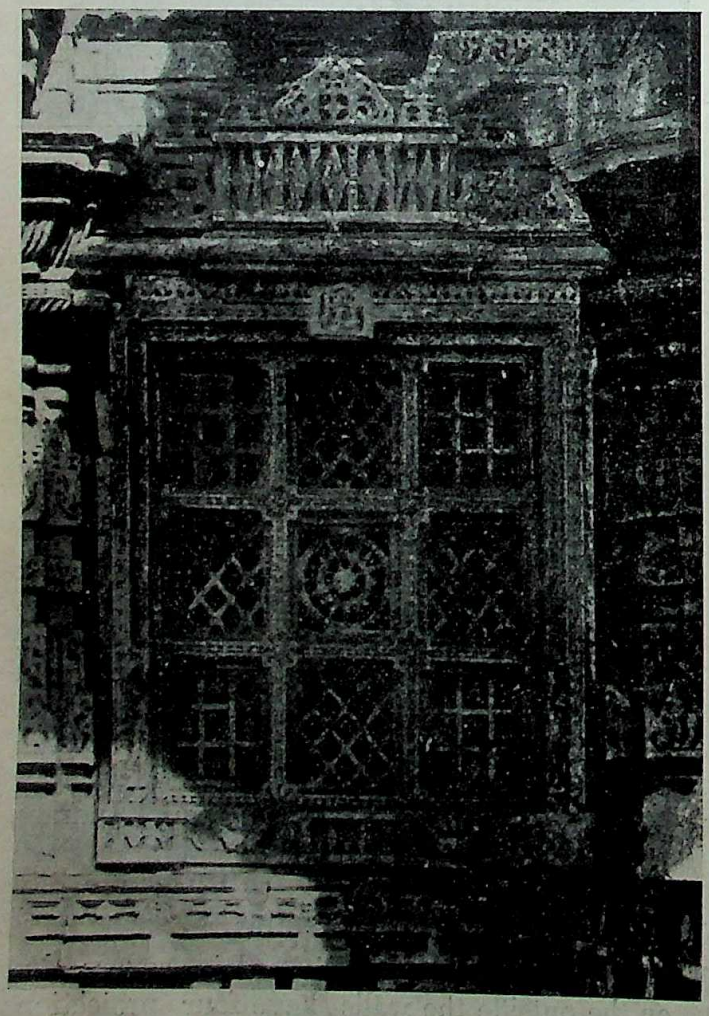
Internally the cella is a plain square, but on the outside the walls have four projections on four sides, and between each projection there are projected angles and recessed corners. The sunlight falling on these radially arranged projections introduce not only

* Fergusson—*History of Indian and Eastern Architecture*. Vol. II, pl. XX, and fig. 286.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

graduated tints of shadows, but also produce a violent but infinitely varied display of light and shade, enhancing thereby the exquisite beauty of the temple. The *garbhagriha* faces west on which side the *mandapa* has been built. Over the plinth of the temple, on the line of the string courses there is a row of *kirtti-mukhas*. At a slightly higher level we find a series of niches containing anthropomorphic figures. Over this is a row of ninety-five divine or semi-divine figures. This endless procession of horizontal rows of sculptures that decorate the walls of the mediæval temples is not a meaningless barbarity. The vast fabric is bound together by a system of thought. By studying them alone an observer can easily guess to which deity the temple was dedicated (this is specially



Stone *jali* work : Siddhanatha temple

useful when the cult image is missing, as is the case with the unfinished Vishnu temple to be discussed in a subsequent section). In t particular case the rows of tall, divine semi-divine figures depict the companions Siva, technically called the *Sivaganas*. T carvings on the *garbhagriha* of the Siddhanat temple may be compared with those Kandaria-Mahadeva temple at Khajurah but unlike the Khajuraho temple this shri is free from all erotic scenes.

Sikhara

The *Sikhara* is the spire which invariab surmounts the roof of the *garbhagriha* of t mediæval temples of northern India. The towers, though square in plan, usually have curvilinear outline in elevation. In the prese case the *sikhara* consists of five compone parts ; first the tower gradually decreasing circumference with the increase of heig Above it is a circular band, over it anoth circular band with human faces carved on over this is the *amalaka*, and above all t *kalasa*. The *sikhara* under consideration in a class by itself. While describing t *garbhagriha* we mentioned four projections four sides with angular projections a recessed corners between them. Each of the angular projections bears five vertical rows miniature temple spires above them, wh the bigger projections bear four slight inclined ridges. At the junction of the ridg and the roof of the sanctum, we find lar *chaitya* windows in high relief, while t surface of the ridges is covered with *chait* window patterns.

The Unfinished Temple

On the northern side of the Siddhanat temple there is a high mound called *Tek* At the top of this we found the *garbhagri* of an unfinished temple. The shrine fac east. The string courses of the plinth consi of three bands of lotus petals, two rows *kirttimukhas*, a row of elephants facing, a a row of dancing human figures. The princip decoration on the wall of the *garbhagri* consists of a horizontal row of divine figur 3′6″ in height, mostly those of *Vishnuganas* companions of Vishnu. As the cult image missing the figures of *Vishnugana* indic that the builders intended to dedicate t temple to Vishnu. The door frame is simi

to that of Siddhanatha temple. At the centre of the horizontal lintels of the doorway we find an image of *Badri-Narayana* in a niche. The deity has four hands two of which are lying on his lap in *dhyanamudra*. The left hand holds a conch (*sankha*), while the right hand holds a wheel. Above these, is the projecting cornice, over which we find a big slab containing images of Siva, and the divine mothers in low relief. Unlike the Siddhanatha temple this has one or two amorous scenes. The cella is a plain square. It has four brackets at the corners and two on each of the three walls. These brackets support a square frame, over this is the octagonal frame on which horizontal slabs of the roof rests.

Plastic Art

For the history of Indian art importance of these two temples cannot be exaggerated. The dissolution of the Gupta Empire disturbed the uniformity of plastic tradition that ruled over the greater part of India. Hence the different provinces evolved local styles under varying circumstances. Thus we find the school of Bihar and Bengal in eastern India, Pallava and the Rashtrakuta styles in the distant south. In Central India we already know of two distinct styles, one that flourished under the patronage of the Haihayas of Tripuri, and the art of the Chandellas of Mahoba. These two temples introduce us to yet another school of art and architecture. Almost all the members of the Paramaras of Malwa were builders, but greatest of them was Bhoja. But most of their work are now gone. Ujain, a famous city of ancient India, hallowed with the name of Kalidasa and other great figures of Indian history, stands now shorn of all its ancient grandeur. At Dhara the few buildings that still survive are all Muslim in character. The iconoclastic zeal of the conquerors has denuded the whole country of almost all its ancient Hindu monuments.

The local people told us that in many inaccessible parts of Malwa temples built by Bhoja still exist. But local traditions are unreliable, and the whole of Malwa, now being included in the territories of various Native States, is *terra incognita* to non-official British Indian archæologists. Therefore, these temples introduce us for the first time to the new type of temple architecture which Bhoja is reported to have introduced in his realm. Apart from architecture the temples under discussion supply us with valuable information about the condition of plastic art under the Paramaras of Malwa.

The modelling of the figures on the *garbhagrihas* is vigorous, soft and graceful. While the figures of the Siddhanatha temple have a tendency towards volume, those on the unfinished Vishnu temple are remarkable for their youthful charm. Most of the reliefs being high, and placed in niches and sunken panels, there is considerable field for light and shade. The jewelleries and other ornaments are laid in a detached manner. The supple and rounded bodies are pleasing to look at, and a faint softness is traceable in expressionless faces. The figures are absolutely without any motion, and the legs are rigid and awkward.

Inscriptions

There are many pilgrims' records in the Siddhanatha temple two of which are important and dated.

(1) The first one records the visit of a man named Thakura Vijadhara (Vidyadhara) who was a *Gauda-kayastha*, on the 13th day of dark half of Asvina in V. S. 1253 (September-October 1196-7 A. D.)

(2) The second inscription states that on Friday the second day of dark half of the month of *Bhadrapada* 1281 V. S. (August-September 1224-25 A. D.) a *Gauda-kayastha* of the name of Raja, son of Sihada visited the temple.

THE RACIAL FACTOR IN INTERNATIONAL RELATIONS

By SASADHAR SINHA, B. A. (Cal.), B. SC. (Econ.), PH.D. (Econ.) (Lond.)

EXCESSIVE preoccupation with the political history of the world during the last few centuries is apt to obscure one's true historical perspective with regard to the destiny of mankind. Looking at the gradual proliferation of European domination over the entire globe, particularly during the nineteenth century, it is natural to arrive at the conclusion that this is the final verdict of history; that this must always be so. The facile division of the human race into "white" and "coloured" with the tacit assumption that the "white" race must always be in the ascendant clearly demonstrates that this danger is not a pure fiction of fancy. If one casts one's mind back sufficiently far and looks at the kaleidoscopic changes in history, one is struck by the fact that practically all races of the world, irrespective of colour, have dominated other races and have been dominated by them in their turn. The true view of European domination over non-European races would thus be to look upon it as a temporary historical phase, as temporary as the Roman empire, the Moorish conquest of Spain, Mongol invasions of the Western world or the vanished glories of the Spanish empire. Aryans, Mongols, Semites, all have had their day. Indeed, we see before our very eyes vast changes taking place all over the world. The "menace of colour" is not so much a menace as a challenge of the bulk of humanity against the political and economic hegemony of a minority of the European races.

Faced with these developments, imperialism is no longer content with direct exploitation of the politically weaker races of the world. It seeks to build its edifice on the solid foundations of science. Anthropology, psychology and latterly, eugenics, have all been laid under contribution. Clearly in so far as they affect public policy, the pursuit of science is quite secondary to their purpose. Thus, although it is usual to set up a cleavage between the "white" and the "coloured" races, it is found that there is as little in common between the "white" races themselves as between those who are classed under the latter omnibus designation. It is well known that the immigration policy of the U.S.A. and Australia is only a shade less discriminating against the Southern or Eastern Europeans than against the Orientals. Professor Griffith Taylor has gone so far as to assert that the Mediterranean races are definitely inferior to the Mongols. In practice, therefore, the scientific generalizations on the superiority of the "white" races are nothing more nor less than an elaborate apologia for the Anglo-Saxons—namely, that the present supremacy they have over non-European races is both justified in fact and in theory.

Briefly speaking, the race theory has taken as many forms as there are races in the world. Thus, at the one end where the European races have been thrown together, as in the United States and Africa, with the Negroes, it has undergone its most monstrous evolution. Miscegenation, which is well-nigh inevitable where two races co-exist, is worse than a crime in these countries, although in both it is the dominant races who were initially at fault. Nevertheless, the process continues. In America, according to some authorities, the racial dilution is taking place on such a vast scale through marriages of "whites" and "near whites" that any prediction with regard to the racial future of the country is premature. Nor is the verdict of science on mixed marriages between the "blacks" and the "whites" unequivocal. Some of the outstanding Negroes of America, like Booker T. Washington and Dubois, are of mixed origin. Indeed, there is a large volume of opinion to show that in most cases the unfortunate results of such marriages are due more to social disadvantages than to differences of race. Nurture rather than nature is at the root of the evil. In Australia, for instance, it is said that marriages between Chinese and Australians have been happy and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

successful, and children of such marriages are "healthier and better cared for than the white children in the same environment with similar white mothers." Professor J. W. Gregory has joined issue with this statement, but his objection may not be primarily eugenic, because almost immediately he adds that "the admission of Asiatics to Australia is unnecessary for the development of tropical regions, for . . . there is nothing in climate to prevent the development of tropical lands by white labour." It is not improbable that a similar motive underlies the following remark. Professor Gregory writes: "Until my first walk through one of the crowded streets in the poorer districts of Calcutta, I had not realized the truth of the classification of the Bengali as Mongolo-Dravidian. I then noted with surprise the strength of the Mongolian element, which explains why the people, whom Sir Frank Younghusband aptly describes as 'the supple, quick, affectionate Bengalis,' although of remarkable intellectual capacity are of unusual mental variability and instability."* It is curious that he should on the same page classify the Eurasians as Aryans. "The objection to inter-racial intermarriage . . . does not apply to that of many people of different cultures, and even colour . . . The Eurasian is the offspring of members of the same race." To assert that the Eurasian, whose parent on the Indian side may belong to any one of the ethnic groups composing India, which are themselves mixed, is racially pure, obviously belongs to the same order of scientific value as to call a particular race mentally variable and unstable and to account for it by its racial make-up. When, however, one turns to regions where the possibility of mass admixture with Europeans is non-existent, the argument takes its stand on grounds which are either fictitious or intangible. One of the popular misconceptions is that Asia is breeding faster than Europe; that the human reservoir called Asia will presently burst and submerge Europe in a devastating flood of colour. But, as Mr. H. G. Wells says: "India and China are no doubt going forward in the population race, but the European and American communities are still going forward much faster."

The propagandist now shifts his ground and takes refuge behind such qualities as individual enterprise and initiative, which he claims as pre-eminently European, but the emergence of Japan as a successful military and industrial nation within the short space of fifty years has clearly demonstrated that such virtues are by no means a European monopoly. Professor Gregory is probably not aware of the contradiction when he concedes that "in ability the European is not probably superior to members of other races who have had an equal training and opportunity." Be that as it may, there is little doubt that no finality can be claimed for the eugenic argument. Apart altogether from its recent origin, the study of racial biology has hardly been carried out under conditions which make for complete objectivity.

Lothropp Stoddard writes: "We whites will have to abandon our tacit assumption of permanent domination over Asia, while Asiatics will have to forgo their dream of migration to white lands and penetration of Africa or Latin America."

This puts in a nutshell the prime motive behind racial antagonism, which in the last analysis is not really a conflict between white and coloured races, but between all races whenever and wherever they compete for their livelihood, for according to the same author, "even within the white world, migration of lower human types, like those which have worked such havoc in the United States must be curtailed." The political motive, the eugenic motive, are both subordinate to the economic motive. The exclusion of Asiatics from North America, Australia, and South Africa, the disfranchisement of the Negroes in the Southern States of U. S. A., the political domination of Europe over Asia are all links in the same chain of argument. "In South Africa the black is so far from being inferior to the white that the Kaffir is debarred from education, skilled trades and various professions, to protect the white from his competition." The lesson of Indian emigration to South Africa is similar. How apparent friendliness can be turned into bitter enmity

* I remember once having a discussion with a distinguished Professor of a well known British University, who similarly characterized the Irish.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

from economic motive is shown nowhere better than in the Northern States of U. S. A. since the Negroes began to drift from the South to the industrial North on account of labour shortage during the War. "The entry of so many Negroes into the Northern labour market aroused jealousy and alarm among the white workers." The history of the anti-Chinese, anti-Japanese and anti-Indian feeling on the Western coast of America is the same. They were welcome as long as they were needed for the opening up of the Pacific region and dispensed with as soon as they were found superfluous or too dangerous as rivals. The quota system applied to European immigrants points in the same direction. "The result is," says M. André Siegfried, "that according to the 1924 law the anuual contingent can consist of only 13.3 per cent. Latins and Slavs as against 86.6 per cent Nordics. Out of 165,000 allowed each year, the Anglo-Irish can send 62,000, the Germans 51,000, but the Italians only 3,845, and the Russians only 2,248." Despite the outstanding contributions of the Jews to European culture, anti-Semitism is more or less latent throughout Europe, and has lately burst into savage flames in Hitlerite Germany. It is well known that it derives its main strength from economic jealousy. Nor is this entirely a European or American phenomenon. The economic motive which brought Japan to the mainland of Asia has led, as sure as night follows day, to the civilizing pretensions of Japan and its corollary, the race cult. The Asiatic "Monroe Doctrine" desired by Japan may never be realized, but it indicates which way the wind blows.

Obviously, then, the so-called race theory has grown out of economic and consequently political necessities. Science is being prostituted for shaping public opinion at home as well as for forging fresh chains for those who are the victims of this insidious propaganda. The psychological weapon becomes indispensable to the economic and politica armoury. It can be used both as a metho of offence and of defence. The quit temporary ascendency, historically speaking of Europe over the rest of the world is raise to the status of a biological theory, whic while speaking for the white race only register a subtle claim for the Nordics. It is a theor which is inwardly inconsistent, for while i speaks of racial superiority of the Norther races, it degenerates into staking economi claims for them over certain regions of th earth. It is inwardly uncertain, for its basi motive is fear, fear of those races who ma yet play the historical rôles that they playe in the past. Mr. Wells says : "They had n sense of the transferability of science and i fruits. They did not realize that Chinam and Indians could carry on the work research as ably as Frenchmen an Englishmen." The biological argument thu raises issues which are as shallow as they ar pernicious, because they not only divid humanity into warring camps, but side-trac the one and the only relevant issue namel the economic motive which lies behind all ra conflicts, between one white race and anothe between one yellow race and another an between all races. The pursuit of false goa only postpones the day when humanity wi live at peace.

THE BRITISH LABOUR PARTY AND DISARMAMENT. WILL THE LABOUR PARTY TAKE THE LEAD?

By WILFRED WELLOCK

Labour Outlaws War

AT last there is a glimmer of light upon the international horizon. Into the gloom caused by the failure of the World Disarmament Conference, the triumph of Hitlerism in Germany and the growth of Fascism on a fairly wide front, the British Trade Union Congress and the British Labour Party have thrown a challenge to militarism which is fraught with profound possibilities, and may be the beginning of a policy which will not only save the world from the horrors of another war but strike a mortal blow at the menacing spectre of Fascism.

At Hastings the Labour Party at its recent annual Conference passed a resolution which instructs the National Executive Committee, in conjunction with the Trade Unions Congress and the Co-operative Movement:

> "to pledge itself to take no part in war and to resist it with the whole force of the Labour Movement and to seek consultation forthwith with the Trades Union and Co-operative Movements with a view to deciding and announcing to the country what steps, including a general strike, are to be taken to organize the opposition of the organized working-class movement in the event of war or threat of war, and urges the National Joint bodies to make immediate approaches to endeavour to secure international action by the workers on the same lines."

Similar action was foreshadowed in the discussion on Disarmament at the Trade Union Congress in September, when it was decided that a special Congress should be called to consider the Executive's proposals on the issue, while a resolution passed at the International Trade Union Congress demanded boycott action at a stage in the development of a war crisis earlier than the actual outbreak of hostilities. It is, moreover, significant that the proposed action was not to be dependent upon a League of Nations decision, but might follow the decision of a Joint Committee of the International Federation of Trade Unions and the Labour and Socialist International specially called "to give a lead to the working class when a state of crisis exists."

This resolution means that British Labour has definitely outlawed war. This view is confirmed by the title "Labour Outlaws War," which Mr. Henderson gave to the speech in which he supported the resolution at the Hastings Conference, and by the assertion in that speech, that the step which had been taken represents

> "a formal break with the old traditions, with the blind loyalties which have made the workers the victims of war. This new spirit, this willingness to dare and risk all things in the cause of peace is, I am profoundly convinced, the beginning of wisdom and the best guarantee of victory in the battle for a secure peace.

Mr. Henderson further reinforced this view by saying that another great War would destroy Socialism itself.

It is quite clear, therefore, that so far as the Labour Movement is concerned, there is to be no more war.

Disarmament Must Follow

Now what is the logical consequence of that decision? It is surely that disarmament must become the definite policy of the Labour Party.

Obviously it is futile to spend some £105,000,000 a year on maintaining a military system which is never to be used, at any rate by a Labour Government. Yet that is what will happen unless the Labour party changes its policy.

And no one would argue that a Labour Government should maintain fighting services which it did not intend to use in order that its political opponents, if they so desire, may plunge the country into war or attempt to impose a Fascist regime on this country!

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Disarmament and the League of Nations

This raises the question of the extent to which a Labour Government ought to be tied to the League of Nations.

It is admitted that a League of Nations is indispensable to the ordered Government of the world, and thus that it ought to be kept intact and made as effective an instrument as circumstances permit. Even if the League is unable to give effect to disarmament, the adoption of its procedure in a time of crisis may cause sufficient delay to prevent the outbreak of hostilities. At the same time it cannot be denied that at present the League, being composed of Capitalist States, ought not to receive the blind support of a Socialist Government.

As time goes on, and the contradictions within the capitalist system sharpen, powerful clashes between capitalist and non-capitalist members of the League are bound to arise. Hence it may well be that decisions will be reached which no Socialist Government could accept. The Imperialist bias within the League was clearly demonstrated by its action over the Japanese invasion of Manchuria. That bias has also been recognized in numerous Labour Party Conference resolutions, as in regard to possible concerted action by capitalist Powers within the League of Nations against Russia.

Moreover the Hastings resolution quoted above authorizes strike action, etc., without reference to any decisions of the League of Nations, while, as already pointed out, the resolution of the I. T. U. Congress reserves to the Joint Committee of the I. F. T. U. and the L. and S. I. the right to determine who is the aggressor against whom boycott action is to be taken.

It is abundantly clear, therefore, that no Socialist Government ought slavishly to accept all the decisions of a League of Nations which is mainly composed of Capitalist and Imperialist States, and thus be tied to the Juggernaut of Militarism which the League of Nations at present maintains. It must surely claim the right to follow a more enlightened policy if it so desires, especially since, as must be frankly admitted, the League of Nations is not as yet a practicable alternative to war.

Capitalism Cannot Disarm

This raises the profoundly important question of whether Capitalism can disarm. I hold that it cannot, and for the primary reason that its policies produce the very fears and antagonisms which make huge and ever-growing armaments necessary. At this very moment the principle of exploitation which is inherent in Capitalism is throwing the world entire into chaos and turmoil. It is responsible for the dictatorships in Russia, Italy, and Germany, as well as in many other countries. It is sharpening the clash between the classes in every European State, in the United States no less than in the South American Republics, and at last throughout the Far East. Its Imperialist manifestations are fomenting revolt in India, in Africa, in the South American Republics, etc. Moreover, as the capitalist system approaches collapse and so-called over-production stultifies and destroys capital on the one hand and intensifies poverty on the other, class antagonisms will multiply and become more acute, whence fear will grow and prevent any real disarmament.

I will reinforce this argument by the following facts:

(1) Armaments are increasing. The oft-repeated statement that this country has disarmed enough already is untrue. No nation has so far disarmed in the least degree. We are spending as much on armaments today as we did ten years ago, but that sum, owing to the fall in prices, buys 50% more armaments. I estimate that during the past twelve years, owing to increased mechanization, concentration upon powerful arms like armoured cars and tanks, the air force and the seaplane, the fighting and killing power of the armaments of all armed nations has at least been trebled.

(2) It is incontrovertible that the prospects of disarmament are worse today, after two years of discussion by the Disarmament Conference, than they were at the beginning.

(3) The rapid rate at which national and international crises are occurring makes it impossible for those who support policies which produce these crises to disarm. The recent action of Germany in withdrawing from the League of Nations and from the Disarmament Conference is but one of these crises.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

should not be regarded as a bolt from the blue, therefore but as an inevitable product of Capitalism, resulting from commercial rivalry, a World War, an iniquitous Peace Treaty, broken disarmament pledges, and class war within Germany itself. If proof be needed that such crises prevent Capitalism from disarming, I will cite the following evidence :

(a) On Oct. 9, 1933, Mr. Henderson, reporting to the Bureau of the Disarmament Conference, admitted that "on the more important questions the approach was manifestly influenced by the present unsettled state of Europe and the resultant distrust and fears."

(b) On Oct. 13, 1933 Sir John Simon stated that the proposed Disarmament Convention would have to be re-cast as "the present unsettled state of Europe is a fact, and statesmen, in drawing up their plans have to face facts."

Hence, with sublime irony, Sir John pleaded for a modification of the proposed Convention, which he described by the word *evolution.*

(4) Owing to the present break-up of capitalist civilization, Treaties and Conventions are being broken wholesale and thus becoming increasingly valueless. Note the following instances :

(a) Japan, for Imperialist reasons has broken away from the League altogether, thus showing the lengths to which the big Powers will go in order to get their way.

(b) Germany, having despaired of the League and of the Disarmament Conference has left both.

(c) The Allied Powers have signally failed to honour their undertaking to disarm, and have thus broken the Peace Treaty of Versailles.

(d) Germany, revolting against what she believes to be humiliating and indefensible clauses in the Peace Treaty, has to some extent rearmed in defiance of that Treaty.

(e) The League of Nations Gas Protocol of 1925, which prohibits the use in war of asphyxiating, poisonous or other gases, is a dead letter, since the poison gas departments of all the armed nations are working at full strength. The total number of staff on the approved establishment of the British Chemical Warfare Research Department on April 1, 1930, was 553, or 73 more than in 1925, the year in which the Gas Protocol was adopted.

(5) The fact—and none will deny that it is a fact—that the Allied Powers will not disarm sufficiently to prevent Germany from rearming, means that when the latter takes place fear will grow, and will lead to an increase of armaments all round, which in turn will lead to war unless the control of the situation passes into other hands than those of capitalist governments.

(6) The last piece of evidence I will give here is a quotation from the Constitution of the International Labour Office, *viz.*,

> "The League of Nations has for its object the establishment of universal peace, and such a peace can be established only if it is based on social justice."

Thus the present capitalist League of Nations as an instrument for establishing peace is condemned by its own offspring, the I. L. O. The simple fact is that in the cauldron of world Capitalism more powerful fears are seething and are being created than have ever been known. Those fears will not only prevent disarmament but will give rise to demands for increased armaments.

Labour and Disarmament

If Capitalism cannot disarm, can Labour? To say the least, it will be extremely humiliating if the supporters of the next Labour Government in the House of Commons are to be asked to march into the Lobby to vote year after year some £105,000,000 for military purposes. It is either madness or cowardice to say we have definitely outlawed war and to go on spending these huge sums on arms. If we do not mean to use them we must not allow others to do so.

The Manchester Guardian in a leading article on Oct. 11, 1933, said :

> "Read literally, the Hastings resolution is a pledge 'to take no part in war' and to resist any war or threat of war, an extreme pacifist declaration which is, as its Tory critics point out, equivalent to support of unilateral disarmament."

That is perfectly true, and to be logical the next Labour Government must embark on a policy of disarmament no matter what other

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

governments may do. And that, I contend, is a practicable policy.

In the first place let us keep in mind the fact, upon which all are agreed, that the next war will destroy civilization, and that there will be little to choose between victors and the vanquished. Thus the one hope of escaping extermination is in being disarmed.

Naturally a nation which disarmed would thereby declare that it would be prepared to take all its disputes before a recognized international tribunal for arbitration. No one could say that such a nation was the aggressor in any circumstances. Hence no one would think of attaching it, and if any Government tried to, it would find that world opinion, and its own working class population were opposed to it, and thus that the risk of going to war was too great.

A World Conscious Working Class

That issue brings us to the heart of the problem. If war is to be eliminated it must be by the creation of a world opinion which stands out from and above that which is marshalled behind Capitalism. That public opinion must consist mainly of working class elements, although other elements will come into it. The workers of the world, now fairly enlightened, are capable of being reached through numerous working class organizations, national and international, and a growing labour press. Working class leaders in every country preach the unity of the world's workers, and dream of realizing that unity. The sole reason that dream is not realized is that those same leaders have so far been afraid to trust their faith. Unity in any sphere can only be achieved by action, acts of courage and faith. There is no issue upon which it would be more possible to weld the workers of the world into a solid unity than that of disarmament; and the one body which has it in its power to achieve that unity on the issue of disarmament is the British Labour Party. I am convinced that a policy of unilateral disarmament carried out by a British Labour Government would have an electric effect upon world opinion, and particularly working class opinion, and would galvanize it into a solid unity. In other words I believe that one of the greatest ideals of modern times has come within the bounds of realization.

I would here like to give two quotations from Mr. Henderson's Hastings speech:

> "If we abandon our international faith, we shall be powerless to save the world from another war, and from the dictatorships and awful tyrannies which are the consequences of war."
>
> "We are the only force in the world strong enough and determined enough to win through to peace."

Precisely. But how can that faith be created if we go on building up military power at the behest of capitalist states? Labour should seek to isolate rather than co-operate with Capitalism; it should expose its evils, not emulate them. Labour denies its own ideals and defeats its most cherished ends, when it adopts the ideology and methods of Capitalism, for have not that ideology and those methods brought civilization to its present *impasse*? Thus a Labour Government must act on Socialist and not on Capitalist lines. Otherwise how will it ever be possible to galvanize world working class opinion into a controlling and challenging unity?

As has often been said, the acid test of peace intentions is the willingness to disarm; and that is as true of a Labour Government as of a Capitalist Government. Likewise the acid test of our faith in working class solidarity is our readiness to trust it, to give it something to live on.

There is nothing to fear. The gains from disarming would far outweigh the losses. As for risks, the risks of disarmament are far less than the risks of armaments. To the argument that by disarming, a Labour Government would forfeit a valuable bargaining power I would reply that it would secure instead such enthusiastic support from the workers and many others, throughout the world as would make the heart of Capitalism quake. The acclamation of the world's workers would be worth more to a Labour Government which had the courage to disarm than any slavish adherence to a Capitalist armaments policy.

Again, to the contention that in case of a war between France and Germany it might be necessary for Britain to assist France,

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

would say that a Labour Government in Britain ought to make it quite clear that under no circumstances would it feel justified in once again attempting to clear up the mess which Capitalism has made in Europe by means of bloodshed. If the loss of 10,000,000 men was not able to put matters right between these two countries fifteen years ago, the loss of 100,000,000 men, women and children (for that is what it would mean) is not likely to do it now.

Moreover, a Labour Government which acknowledged in deed India's absolute right to determine her own Constitution, and which stood firmly against every form of exploitation of the natives in Africa and for their development through the fullest use of their right of self-determination, would have no need of extensive armies or of bombing machines in "those outlying regions" which are doing so much to prevent disarmament today.

At the Hastings Conference someone asked how a policy of disarmament would square with a bellicose Japan which sought, say, to take possession of some portion of Australia. The reply is that the whole question of emigration and the distribution of the world's population will sooner or later have to be thoroughly explored. If Australia, or any other country should be unwilling to do that, (and no one is entitled to assume that she would), I do not think we or anyone else ought to be called upon to support that unwillingness by going to war. The simple fact is that the world has got to be trained to apply reason and conscience to the problems of life, and an essential condition of that training is the abolition of armaments. The nation which has the courage to blow up its own arms will do more in one hour to secure the sovereignty of reason and morality than has been accomplished by a thousand years of warfare.

Towards New Horizons

The Labour Party is thus presented with a magnificent opportunity of leading the nations towards new horizons. Everywhere the people are ready for a strong lead on the issue of disarmament. Individual resistance to war is taking root in the Universities and in the Churches in this and other lands, as well as in the ranks of Labour. Certain polls which have recently been taken in this country and also in America show a powerful vote in favour of disarmament by example. In Europe, again, young men are in prison for resisting conscription in no fewer than six countries, while very active anti-conscription movements are in being in Belgium and France. So alarmed have the authorities become in France and Belgium at the growth of such movements that special measures are being taken to combat them.

Therefore, let the Labour Party, in the words of Mr. Henderson, "make a living reality of the international solidarity of the workers" by leading the world to peace through disarmament. It will never lead the world to peace by playing the armaments game of the capitalist Powers. The opportunity may come sooner than we expect. Let us be ready to seize it when it does. Having outlawed war, let the Labour Party face the logic of its decision, complete the work it has so well begun, and courageously decide to embark upon a policy of total disarmament. Along no other road can mankind free itself from its nearest menace. The League of Nations has given us words. The Disarmament Conference has given us words. It is by deeds that the world will be saved: and these must not long be delayed.

HISTORICAL BACKGROUND OF THE INDIAN CONSTITUTION

By SUDHIR KUMAR LAHIRI and BENOYENDRANATH BANERJEA

I

SINCE Indians began to demand the right of popular self-government, an oft-repeated objection raised against this claim has been that India does not possess any tradition or history showing her fitness for such government. India, it is said, has from time immemorial been used to unmixed autocracy and it is, therefore, in the fitness of things, that she should for all time to come be governed according to autocratic methods and standards. Self-government, it is urged, is achieved by practising it. Indians had no experience of popular self-government. Indians could not, therefore, be expected to work properly and efficiently institutions based on popular principles.

The argument underlying this objection to the introduction of any measure of popular self-government in India has been met as often as it has been raised. But like Banquo's ghost it appears and reappears over and over again. An organized campaign of publicity is being conducted against India among vast masses of ignorant and unsuspecting peoples in both hemispheres at the present moment. This virulent propaganda is being engineered by wealthy and powerful groups of persons and interests having unbounded resources at their back, with the support and help of a government, perhaps, the most reactionary of modern times. It may not be inappropriate, at such a time, to take a retrospect of the historical and political background of the Indian constitution.

II

India possesses a very ancient historical past. Owing, however, to lack of proper materials, based on reliable evidence, it had not, so far, been possible to prepare any continuous record of the public events of the country up to the seventh century B. C. But with such records as were available, India's history could be traced so far back as to 3000 B. C. The archaeological discoveries recently made at Harappa in the Punjab and at Mahenjo Daro in Sind bear evidence of a civilization which appears to have flourished in a still remoter antiquity.

There is ample evidence that in the early periods of history, there existed in India states with oligarchic or republican forms of government. Vedic literature contains references to non-monarchical forms of government and to a system of conducting publ administration by means of an assembly of t people. In the *Mahabharata* also menti is made of similar states without kings.*

The popular assembly was also a famil institution in the early years of the Buddhistic age The earliest Buddhist records reveal, says Pr Rhys Davids, the survival side by side wi different grades of monarchies, of republics wi either complete or modified independence. Ev as late as the time of Alexander's invasi (327-325 B. C.) popular institutions flourished the numourous principalities of the Punjab From references made in various works it m be assumed that such forms of governme existed in this country even after the six country A. D.

The history of the Hindu Power in Ind may, for all practical purposes, be said to ha come to an end at the close of the twelfth centu A. D. A succession of brilliant rulers—Chandr gupta Maurya; his illustrious grandson, Asok the Great; Samudragupta, who died towards t end of the fourth century A. D.; his famo son Chandragupta Vikramaditya; Harsavardha who ruled till the middle of the seventh centu A. D.—have left marks of their uncomm powers of administration. The achievements these rulers and of many others in every bran of civic and political life and in the spheres literature, art, and science have extorted univers admiration. An eminent English writer descri Asoka's reign as "one of the brightest interlu in the troubled history of mankind." Al among the conquerors he was so disgusted

* *Vide* K. P. Jayaswal—*Hindu Polity.*

† Referring to the system of governm prevailing among the Sakyas, Prof. Rhys Dav says: "The administrative and judicial busin of the clan was carried out in the public assem at which young and old were alike present their common Mote Hall at Kapilavastu. single chief—how and for what period cho we do not know—was elected an office-ho presiding over the sessions, and, if no sessions sitting, over the State. He bore the title of R which must have meant something like Roman Consul or the Greek Archon"—*Budd India.*

§ *Public Administration in Ancient Ind* P. N. Banerjea

the cruelty and horror of war that he renounced it.*

Some of the edicts of King Asoka emphasize the duties of the monarch and assure the people of his accessibility to them at all times of the day.

The elaborate organization of the vast empire of the Mauryas, specially its army, the division of various activities of government into groups, under different councils, and such progressive aspects of administration as the elaborate municipal administration of their capital Pataliputra; the maintenance of a regular census; the institution of a jail code; and the establishment of a foreign department, for instance, excited the wonder of even such a widely-travelled person as Megasthenes, the Greek ambassador.

During all this period India was not ruled as a single country. It was, in fact, divided into numerous kingdoms and principalities. In some cases, however, very large tracts came under the sway of a single overlord. Whatever the forms of government existing in those times, a very vigorus system of local government formed the basis of the political structure in India†

"The freedom and general happiness attained by the people of Great Britain with the help of Parliamentary institutions and the richest revenues of the world can hardly be compared with that which Indians within the Aryan pale enjoyed both before and after he fifth century A. D.—the time which we regard as our Dark Ages, and theirs. The Indo-Aryan constitution, built up by the highest intelligence of the people upon the basis of the village communities, and not wrung from unwilling war-lords and landlords by century-long struggles and civil wars secured to the Indian peasant-proprietor not only the ownership of the land, but very considerable powers of self-government. The powers of the Central Government, though they might often be abused were at least delegated to it by the people themselves and limited by unwritten laws which by common consent were given a religious character.—E. B. Havell—*Aryan Rule in India.*

It is significant that some writers in ancient India regarded the science of politics as the central science from which all other sciences originated. Kautilya's *Arthashastra* refers to thirteen authors and five schools of political thought. These speculative theories exercised a considerable influence in regulating the course of public affairs. The monarch according to one school of thought was bound by contract to his people under which in return for the latter's obedience and payment of state-dues the former was to secure the life and property of the people and ensure a regime of justice. The monarch's authority was also upheld by another school by attributing divinity to the king. In actual practice, the monarch was guided by the trend of popular opinion to a greater or less degree, as the situation demanded.

Instances of elected kings are not rare,* and women were not absolutely excluded from succession. The system of government was organized on very scientific principles. The administrative system was composed of four distinct elements, *viz.*, the king, the ministers, the council and a highly organized class of officials.†

In Bengal, according to a Sanskrit work called *Manjusri Mulakalpa*, after king Sasanka a republican government existed for some time. The famous Bengali king Gopala was an elected monarch and even before him a popular Sudra leader was elected king and ruled for 17 years. It shows that "Bengal in the eighth century had freed herself from the law of caste and the Vedic theory of birth superiority and that Bengal had anticipated in 700 A. D. Govinda Singh

---

* "He organized a great digging of wells in India and the planting of trees for shade. He founded hospitals and public gardens and gardens for the growing of medicinal herbs. He created a ministry for the care of the aborigines and subject races of India. He made provision for the education of women. He made vast benefactions to the Buddhist teaching orders, and tried to stimulate them to a better and more energetic criticism of their own accumulated literature, for corruptions and superstitious accretions had accumulated very speedily upon the pure and simple teaching of the great Indian Master (Buddha). Missionaries went from Asoka to Kashmir, to Persia, to Ceylon and Alexandria." *A Short History of the World*—H. G. Wells.

† "It is interesting in reviewing the past history of India to trace a remarkable continuity of policy on the part of the rulers of whatever nationality who have succeeded in welding together the great congeries of widely differing races and tongues. The main principles of government have remained unchanged throughout the ages. Such as they were under the Maurya empire, so they were inherited by the Muhammadan rulers and by their successors, the British. These principles are based on the recognition of a social system which depends ultimately on a self-organized village community. Local government thus forms the basis of all political systems in India."—E. J. Rapson—*Ancient India.*

* At least in two cases kings were deposed by the people. King Brihadratha, the last Maurya emperor, according to Bana, the famous author of "Harsa-charita," was deposed for 'being weak in keeping his coronation oath." For the offence of parricide King Nagadasako made room for the first king of the Sisunaga dynasty.

† R. C. Majumdar—*Ancient Indian History and Civilization.*

and Rammohun Roy, Dayananda Saraswati and Gandhi".*

Possibly the most vigorous development of community life was attained in Southern India. The administrative system of the Cholas, for instance, accepted the village community, composed often of a single village or oftener of a group of villages, as the unit of government. The assemblies of these village communities, subject to some supervision by divisional officers were practically sovereign in all the departments of rural administration. Several of these village unions (*Kurram*) formed a district, and a number of the divisions formed by such districts constituted a province (*Mandalam*) under a viceroy selected from the royal family. The Chola empire was divided into six such provinces.

The village communities of southern India, of which minute details are now available, in some cases possessed extensive powers and exercised many beneficent functions, some of them yet to be emulated by modern municipalities.†

III

It was in 711 A. D. that Muhammad ibn Kasim set foot on the soil of Sind and conquered that part of Indian territory. This was, however, more or less, a temporary occupation and was followed by the raids of Subaktagin, Sultan of Ghazni, and his son Muhammad Ghazni. The country, however, gradually came under Muhammadan supremacy from the date of the decisive defeat of Prithwiraj and his Hindu confederates by Sahabuddin Ghori at the second battle of Tarain (1192).

After incessant struggle between contesting Muhammadan dynasties, Hindu rulers joining one party or other or fighting with both, large tracts of the country came under the sway of the Mughal house of Timur. During these years at least two rulers, Alauddin Khilji (1296-1316) and Sher Shah (d. 1545) showed consummate administrative skill. But it was under the Mughals, especially under Akbar the Great, (1556-1605), that the country reached the summit of glory during Muhammadan rule.§

Decay and disruption may be said to have set in at the close of the rule of Aurangzib (1658-1707). The rise of the Mahratta Power (1718-1818) under the genius of Sivaji, and of the Sikh Power (1803-1849) under the military prowess of Ranjit Singh, furnished short interludes in Indian history, contributiug new experiments in government.

Sir Jadunath Sarkar in his *Mughal Administration* says: "The Mughal system at one time spread over practically all the civilized and organized parts of India. Nor is it altogether dead in our own times. Traces of it still survive, and an observant student of history can detect the Mughal substructure under the modern British-Indian administrative edifice."

In spite of the democratic character of their religion, Muslims in India introduced a system of government based on military models and needs. The Mughal rule was a centralized autocracy. Yet, as has been pointed out, the people endured Mughal rule in so far it came to be based on religious toleration, social freedom and respect for village autonomy. This implied on the one hand a comparatively narrow scope of state-activity, and on the other, the enjoyment by the rural communities of a limited form of self-government in their spheres.

The emperor used to have a council for purposes of consultation, consisting of the *Vakil* or chancellor and a number of departmental heads. The central government exercised control over provincial administrations by devising a series of checks on the governor's powers. Such powers were applied through limitation of tenure, transfer of officers and the appointment of some of the subordinate responsible provincial officers from the headquarters. Moreover, the emperor by means of imperial tours, personal dispensation of justice at the centre, public appearance on specified occasions, etc., attempted to co-ordinate the administrative machinery, so far as circumstances permitted..*

This centralized administration lasted for a little over two centuries. The adoption, by Muslim rulers, of the country as their own, led to the evolution of a common language (Urdu) and a composite civilization, arising out of the contact of Hindu culture with that of the Muslim immigrants.

In the Deccan, the Hindu empire of Vijayanagar (1336-1646) embodied the political and social aspects of Hinduism as practised in the South. Among its rulers was Krishna Raya (1509-29) described as the 'greatest of the South Indian monarchs

* K. P. Jayaswal in *The Modern Review*, August, 1933.

† S. K. Aiyangar—*Ancient India*, and *Hindu Administrative Institutions*.

§ In his brilliant monograph on *Akbar*, (1932), Laurence Binyon, after describing how the great Mughal Emperor consolidated his conquests, writes :—"His greater achievement as a ruler was to weld this collection of different states, different races, different religions, into a whole. It was accomplished by elaborate organization—Akbar had an extraordinary genius for detail—still more by the settled policy which persuaded his subjects of the justice of their ruler. Akbar's conceptions were something new in the history of Asiatic conquerors. Though a foreigner, he identified himself with the India he had conquered. And much of his system was to be permanent. The principles and practices worked out by Akbar and his ministers were largely adopted into the English system of government."

* Beni Prasad—*History of Jahanghir*, Chap. 4.

He was a contemporary of King Henry VIII of England. Paes, a Portugese traveller has left for us an 'obviously truthful' account of Krishna Raya's rule.* After describing the magnificence of the court and the capital, and the permanent army of a million troops, Paes notes that the empire was divided into 200 districts, each under a feudal noble. The government was strong and well-organized, and art and architecture flourished as never before.† The King was assisted by a Council composed of ministers, provincial governors, military commanders, eminent theologians and literateurs. The village moots managed local affairs through hereditary officers, maintained either by royal grants or contributions from the cultivators.§ The Hindu tradition of government thus continued to exist in southern India.

At a later period, Sivaji, after consolidating his position, designed his administrative departments on early Hindu models. The government of his kingdom was conducted by the Raja, aided by a council of eight ministers, *the Ashta Pradhan*, of whom the chief was the Peshawa or prime minister. This arrangement was reproduced in the district administration also.** The Mahratta army and navy, the civil administration and the revenue system of Sivaji, considering the unsettled conditions of his territories, have been regarded as remarkably efficient by competent observers.

IV

England gained her first foothold in India at the dawn of the seventeenth century A. D. when the East India Company, a commercial and trading concern began its operations in this country. The company received a Royal Charter which gave it very large powers including a monopoly of trade,†† and the right to acquire territory and to make regulations for the government of such areas.

In 1693 Parliament passed the famous resolution declaring that all British subjects had an equal right to trade in the East Indies. The Company, however, continued to keep the eastern trade closed to outsiders. Gradually, Parliament, in renewing the charters granted to the Company, limited its trading rights and imposed duties necessitated by the increasing administrative responsibilities on the Company.

Although several other European Powers entered into competition with the British in the struggle for supremacy in India, after protracted warfare extending over a lengthy period, the British ultimately came out victorious.

The grant of the *Dewani* of Bengal, Bihar and Orissa to the Company by Emperor Shah Alam in 1765 was a landmark in the consolidation of British power in India. This practically marked the beginning of British territorial sovereignty.* The double government under Clive, the chaos and corruption† in administrative and trading methods gave rise to criticisms. Further, the fabulous wealth acquired by British traders in India along with the vulgar display that they made of their riches aroused jealousy in many quarters in England. At last the British Parliament was induced to take measures for regulating the administration of the territories by the company. The secret enquiry into its affairs by a Parliamentary Committee (1772) and the request of the Company for pecuniary assistance (1773) resulted in two Acts, one granting a loan of £1.4 millions with safeguards, and the other the famous Regulating Act. Lord North's Regulating Act of 1773 was enacted with a view to introducing a system of effective control and supervision over the Company's policy and administration. This was the first of a series of Parliamentary enactments regarding India.

Hitherto the three Presidencies of Bengal, Madras and Bombay had been independent of one another. With the passing of the Regulating Act, Bengal was given supreme power over the entire country with a Governor-General and four nominated councillors, who also administered the Presidency of Fort William (Bengal). A Supreme Court was also set up in Calcutta to administer law. The machinery in England for the administration of the affairs of the Company

§ Ishwari Prasad—*History of Medieval India*, Ch. 15.

** S. N. Sen—*Administrative System of the Mahrattas.*

†† Whether this monopoly, granted without the consent of Parliament, was legal was decided in favour of the Company in 1685 in the case of the E. I. Coy. *v.* Sandys.

* The Company, of course, did not want to assume the sovereignty directly. "Clive seems, in 1756, to have desired the *Duwani* of Bengal rather than any territorial cession, which could have been obtained just as readily. It placed the Company in a strong tactical position alike as regards foreign powers and as regards the government at home" (Dodwell on "The Development of Sovereignty in India" in the *Cambridge History af India*, Vol. V, Ch. XXXII).

† Reports of Parliamentary Committees appointed after 1769 made the calculation that between 1757-66 the Company's servants received as presents from Bengal a sum of £2,169,665. This was apart from such acquisitions as Clive's *Jagir* valued at £600,000, the gains made from private trade by the Company's servants by abusing privileges granted to the Company and £3 3/4 millions paid as "compensation for losses incurred" to the officers of the Company.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

was, however, allowed to continue without any important change.

The arrangement introduced by the Regulating Act, which was halting in its principles and ambigous and indistinct in specifying the jurisdictions of the Supreme Court, the Council of the Governor-General and the Govornor-General, proved unworkable. It was mainly through the instrumentality of Sir Philip Francis, a powerful antagonist of Warren Hastings in the Governor-General's Council, that the unfairness of the Company's administration was brought to the fore.* After some controversy the measure known as Pitt's India Act was passed in 1784. Under the provision of this Act a Board of Control,† under the official style 'The Commissioners for the Affairs of India,' consisting of the Chancellor of Exchequer, a Secretary of State and four Privy Councillors was established in England.§ The President of this body gradually centralized vast powers in his hands and became the forerunner of the office of the Secretary of State for India. The President was almost always a member of the Cabinet and changed with the party in power. This brought all the operations of the East India Company under the complete control of the Board. The indirect influence exercised by the presence of two Cabinet ministers at least, eventually led to the establishment of the supremacy of the British Parliament over India. The Board could disapprove or modify the despatches of the Directors of the Company and even secret orders had to be communicated to t Board.

The administration of each of the thr presidencies was vested in a Governor and thr Councillors including the Commander-in-Ch of each Presidency.

With the passing of the Charter Act of 18 the East India Company was compelled to clo its commercial business and became a pure political and administrative body, holding territories, which had enormously expanded, trust for the Crown.

According to the provisions of the Act t direction of the entire civil and milita adminstration and the sole power of legislati were vested in the Governor-General in Coun of India. This was the first time when t Governor-General in Council was styled " India." Only one member of the Board Control, *viz.*, the President, was required to nominated and it became, therefore, a one-m Board from 1841.

In 1853, when the Charter Act was renewe not for 20 years, as on previous occasions, b significantly enough, "until Parliament sh otherwise provide," it was specified that a thi of the membership even of the Court Directors of the Company was to be nomina by the Crown. Bengal was made a separ province under a Lieutenant-Governor and t Government of India assumed the character a general controlling authority. The Act al gave India her first Legislative Council 12 members, which was, however, a pure official body. Its meetings were open to t public and the proceedings were to be offici published. The system of nomination to t Indian Civil Service which had so far be followed was replaced by a system of op competitive examination held in London, t first regulations of which were drawn up by committee presided over by Macaulay in 1854.

During the discussion of the Charter Act 1853 in the House of Commons, John Bri advocated the assumption of the government India directly by the British Crown. characterized the past history of India as history of revenue wasted and dome improvements obstructed by war." The syst of double government, in his opinion, "introduced an incredible amount of diso and corruption into the State and poverty wretchedness among the people." It according to him, "a system of hocus-pocus wh deluded public opinion, obscured responsibil and evaded Parliamentary control."

V

The Indian Mutiny (1857-58) eventu brought about the transfer of the government India from the East India Company to the Bri Crown.

* A Parliamentary Committee, presided over by Edmund Burke, considered the administration of justice in India, and changes were accordingly introduced in conformity with the report of this Committee, submitted from time to time from 1781 onwards.

A secret committee under the chairmanship of Dundas, also considered the state of British government on the Carnatic coast. The reports of the two committees were far from complimentary to the administration by the Company (Ilbert, *Government of India*, pp. 60-61) Charles James Fox in 1783 presented a drastic bill proposing the suspension of the Company's charter for four years and providing for the management of the affairs of the Company by seven commissioners nominated by Parliament. The bill though passed by the House of Commons was thrown out by the House of Lords at the King's behest

† The function of the body was "to superintend, direct and control all acts, regarding the civil and military government of Indian territories." C.P. Section 2(2) of the *Government of India Act* 1919.

§ The Commissioners did not receive any pay till 1793, when the payment of the members and staff of the Board was made a charge on Indian revenues.

In December, 1857, Lord Palmerston, as Prime Minister, announced that a bill embodying the principle of direct control would soon be placed before Parliament. This evoked a spirited protest from the Court of Directors of the East India Company whose memorandum was drafted by John Stuart Mill, an employee of the Company. It characterized the proposed transfer of a "semi-barbarous dependency" to the Crown, as "a folly and a mischief." After acrimonious debates and replacements of draft Bills, consequent upon change of Governments, the bill drafted by Lord Stanley was finally passed as the Government of India Act, 1858.

The Queen's proclamation, said to have been drafted by John Bright, was read by Lord Canning on the 1st November, 1858, at Allahabad, which he regarded as more centrally situated than Calcutta. The proclamation among other things announced to the princes of India, that "all treaties and engagements made with them by or under the authority of the East India Company are by us accepted, and will be scrupulously maintained" and that no extension of the "present" terrritorial possessions was desired." It continued;

> "We hold ourselves bound to the natives of our Indian territories by the same obligation of duty which bind us to all our other subjects·····And it is our further will that, so far as may be, our subjects of whatever race or creed, be freely and impartially admitted to office in our service, the duties of which they may be qualified by their education, ability and integrity duly to discharge.···
>
> "When, by the blessing of Providence, internal tranquillity shall be restored, it is our earnest desire to stimulate the peaceful industry of India, to promote works of public utility and improvement and to administer the government for the benefit of all our subjects resident therein. In their prosperity will be our strength, in their contentment our security, and in their gratitude our best reward."

The Proclamation was described by some as the Magna Carta of the people of India* and by others as unnecessary and inexpedient as "no change whatever of principle was required."† The Governor-General's short Proclamation accompanying the Queen's was also described by a contemporay writer as dissonant with the latter as it summoned the faithful to co-operation, and was calculated to "exact a loyal obedience" from India's millions; and he protested against the Queen's name being forged to promises made only to be broken later by the authorities in India.* The Queen's Proclamation announcing the resolve "for diverse weighty reasons" to take up the Goverment of "the territories of India, heretofore administered in trust for us by the Honourable East India Company." introduced a new order, if not in fact, at least in law.

* *The Company and the Crown*—Thurlow, Private Secretary to Lord Elgin, p. 245.

† *India under Dalhousie and Canning*—Duke of Argyll.

VI

Our survey of the past political history of India, though brief, gives unmistakable evidence of brilliant and original achievements in almost every department of public activity along with the growth of institutions of a popular character indigenous to this country. It was the advent of foreign elements in the government of this country that served as a blight to all constitutional progress. This checked and hindered any normal and regular development in the political and constitutional sphere.

During the hundred years that have elapsed since the passing of the Charter Act of 1833, efforts have been made from to time to introduce popular institutions, so that it cannot now be said that the people have not been used to these. But such efforts have always been of an utterly inadequate and haphazard nature and the working of the political institutions of the country have been on entirely wrong lines.

A special feature of British rule in India is that the destinies of the country are controlled and guided from a distance of thousands of miles. The British in India, unlike the Muhammadan rulers, have neither made the country their adopted home nor has any serious attempt been made to model the constitutional and administrative structure on indigenous lines. A study of the evolution of parliamentary control over Indian administration, shows that not only are all the powers and privileges of the Government of India derived from the British Parliament, but that the closest supervision is exercised from Whitehall over the entire area of the Government of India. Popular institutions cannot be expected to flourish in such singularly adverse circumstances.

The year 1832, which saw the passing of the famous Reform Act is considered as an important landmark in the constitutional history of England. The century that has elapsed since then has given birth to notable reforms in various spheres of national life in England. Both England and India have been under the same government all this time. Exigencies of Government have necessitated the adoption by the British authorities from time to time of such policies as the consulting of Indian opinion, the 'increasing association of Indians' in administration, and of holding out the promise of 'responsible self-

* *Thoughts on the Policy of the Crown*—J. M. Ludlow.

Digitized by Arya Samaj Foundation Chennai and eGangotri

government.' The Montagu reforms arising out of the pronouncement of 1917 have proved to be ineffective and unsatisfactory; and the British Government have so far failed to take adequate and proper measures to appease Indian opinion. An examination of the proposals embodied in the White Paper (1933) leaves no room for doubt of their utterly undemocratic and retrograde character. Not only are the proposals in direct contravention of the policy of responsible self-government to which the British Parliament and responsible British statesmen are committed, but they are designed to introduce conditions and safe-guards which would render the constitution a most ineffective instrument for progress.

The Passing of the Charter Act in 1833 which brought about a welcome change in the British administration of India is considered as the first mile-stone on the road of political progress. After a lapse of one hundred years, the British Government find it difficult to gather courage to fulfil even their promise 1917, as the White Paper reveals. In a coun where the community spirit and local s government continued to flourish throu the vicissitudes of history even up to the d of early British rule, the British government h not only not appreciated and fostered the habit self-rule but have allowed it to languish a decay. We are confirmed in this view when compare the progress achieved during the sa period by such countries as Canada, a Brit colony, and Japan, regarded as merely an 'east country' with the progress made by Ind In the course of a century, Canada, from t days of the Durham Report (1838), has reach the stage of virile manhood, under the regi legalized by the Statute of Westminster (193 Japan, in the meantime, has also become o of the Powers of the world and has found possible to divest herself of the feudal a autocratic bases of her government.

BOOK REVIEWS

Books in the principal European and Indian languages are reviewed in THE MODERN REVIEW. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.—Editor, THE MODERN REVIEW.

ENGLISH

THE JAPAJI AND DISCOURSES ON THE BHAGWADGITA. *By Mehta Udhodas, B.A., LL.B., F.T.S. 1932. Price Rs. 2, cloth Rs. 2-8.*

The Japaji is a religious book which deserves perusal, the Sikhs like any other nation clinging to their scriptures with reverence. The text and the translation are admirably printed side by side, covering about 64 pages, and the commentary is the author's own contribution to the understanding of the holy book. The Gita discourses deal with topics of current interest like *Ahimsa*, the *Varna-system*, *the Yajnas*, *knowledge versus action*, man's final goal and the function of the true *guru*. Udhodasji is a *Bhakta* and he has a soft corner for *Bhakti-yoga*, though he recognizes its harmonizing influence, and emphasizes now knowledge, now devotion shown in the *slokas* contained in the book. Written with zest and on a subject with which the writer is in constant touch, the book deserves a wide publicity which, we hope, it will receive.

SPIRITUAL TEACHINGS OF SWAMI BRAHMANANDA. *Sri Ramkrishna Math, Mylapore, Madras. 1932.*

This is a selection of spiritual instructions given from time to time by Swami Brahmananda either through informal conversation or in personal letters to his disciples when, as Devmata informs us in the foreword, in a later period of his administration as the head of the Ramkrishna Mission, he issued from his accustomed retirement and became an active visitor at the various centres. These instructions, already published in the *Vedanta Keshari*, have now been given a more permanent form in the present volume: some of them are in the form of questions and answers, while others are in the way of general discourses.

The teachings embody useful suggestions to those who seek to attain a spiritual life; written in a style which breathes peace and love, they aim at being practical and definite. Details about diet, etc. are given, and though sometimes there is a repetition, it has a saving grace of warning and caution. The words of admonition are instinct with a passion for the realization of God, and inculcate energy without end. "Shake off despair, shake off disappointment, shake off doubt, make no compromise. Have infinite tenacity, and infinite energy." Again, "God you must realize; now in this very life you must see him."

The book is sure to win appreciation from those who are seekers after God.

BHAGAVAD GITA: *Translated into English verse with introduction and notes. N. V. Thadani. Bharat Publishing House, Karachi. 1933. Six annas.*

This is a happy rendering of the "celestial song" which deserves to be popular. The writer, Mr. Thadani, introduces his subject with his idea of the Essence of the Mahabharata, going through the *parvas* one by one, and then follows the Essence of the Bhagavad Gita, which the writer seeks to unravel chapter by chapter. He holds that the Gita is a logical step, showing how a progression of ideas from Sankhya to Vedanta, through Nyaya, Vaisheshika and Yoga: his interpretation is thus a fair attempt to correlate the different systems of Hindu philosophy and place them in a logical order, in which a distinct position belongs to the Bhagavad Gita.

The notes at the end will be helpful to the reader who will try to understand this invaluable book through the medium of English. The translation is a lucid version, and the writer's rendering has the additional merit of being in verse. It is sure to be received with grateful appreciation by all lovers of the Gita.

PRIYARANJAN SEN

MARTYRED IN MEXICO: *By R. J. Masters, S. J., Light of the East Office, 30 Park Street, Calcutta.*

This is a brief life-sketch of a Roman Catholic priest who suffered imprisonment and was finally shot dead under orders of President Calles of

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Mexico. As might be expected, the author claims that Father Pro, the martyr, was only ministering to the souls of Catholic believers and was wrongly suspected of complicity in an attempted political murder and was killed without even a semblance of a trial. This, however, is a matter on which it is difficult to express an opinion without a knowledge of details of recent Mexican history. So far the author judges and vindicates the Father's character on secular grounds. But at the end of the book (p. 82 *et seq.*) he cites evidence of another kind to prove his martyrdom, *viz.*, cases of those (mostly of women) who were healed of blindness and other ills by praying to the departed soul of the Father. We are told of a woman, for example, who had a malignant tumour in the breast and whose disease was so far advanced that doctors advised immediate operation. And this was the opinion not of one doctor but of several. But even this fell disease was cured, without operation, by prayer to the departed Father Pro. The prayer which produced such marvellous results is also given at the end of the book. On the efficacy of prayer in general and of prayers of this kind specially, diverse views have been held even by the most thoughtful among men and men of lesser faith should not venture an opinion.

U. C. Bhattacharjee

SHARADASHRAM VARSHIK, OR THE FIRST ANNUAL OF THE HISTORICAL RESEARCH SOCIETY OF YAOTMAL: *(Berar) Containing 6 English and 10 Marathi articles, issued under the editorship of the Secretary Yashvant Khushal Deshpande, M. A., L. L. B, pages D. O. 51 English and 116 Marathi with 8 illustrations. Price Re. 1-8-0.*

The indefatigable secretary Mr. Deshpande is doing great service to Indian history by organizing a body of expert workers for historical research in his province of Berar, which, it may not be generally known, is rich in historical antiquities and yet comparatively unexplored. The Ashram has undertaken at Yaotmal a task of threefold research in archæology, history ancient and modern, and literature, including varied subjects such as coins, alphabets, religious practices and similar topics of antiquarian interest. Berar boasts of many places of ancient fame, now buried under mounds of earth, which, if properly excavated, are likely to yield grand results. The articles printed in the annual are from the pen of many reputed scholars and deal with varied subjects of historical import. They are mainly remarkable not so much for the actual output of new discoveries, as for the directions they point out in which further research is urgently demanded. The elaborate introduction by the secretary is eloquent and instructive. We hope that the appeal made by Mr. Deshpande for workers and funds will meet with a ready response.

G. S. Sardesai

RECONSTRUCTION AND EDUCATION IN RURAL INDIA. *By Premchand Lal, Ph. D. Published by George Allen and Unwin Ltd., London. Price 10s. net.*

The book under review has been written in the light of the programme of work carried on at Sriniketan, the Institute of Rural Reconstruction founded by the great poet, Rabindranath Tagore. The author is well qualified to describe that work as he was for some time intimately connected with the Visvabharati Institute of Rural Reconstruction as its Director. The author first deals with the problem of rural reconstruction and the intensity of the problem at the present moment and then gives a history of the Visvabharati and the Sriniketan which was established as a supplement to the work of Santiniketan, under the directorship and guidance of Mr. L. K. Elmhirst who brought with him all the necessary technical experience obtained in England and America.

Though the author gives his opinions on the various aspects of rural reconstruction and education in India, he mainly deals with the aims and objects of the Sriniketan Institute which are quoted in this book. He first discusses at length the main activities of the Institute for agricultural and industrial improvement of the village and then gives a detailed account of its educational activities and the *Brati Balak* or scout organization which is the most important adjunct of the Institute in spreading the ideals of service, self-reliance and discipline. The author next narrates the efforts of the Institute in connection with the Rural Experimental School. The author then deals with a number of topics, not related to the actual work done at Sriniketan but as ideals to be set forth before the public, and states his opinions on (1) the Rural Elementary School, (2) the Scout Movement, (3) the Education of Adults, (4) the Education of Women and Girls, (5) Vocational Training, and the Training of Teachers and Community Leaders.

"Reconstruct the villages" has been the cry for some time past and it is really gratifying to find much good literature published on the subject of rural reconstruction in India. Though the work of Dr. Premchand Lal has not been exhaustive in more respects than one and though it does not give any comparative and critical account of the various rural reconstruction schemes adopted in different parts of India, yet it may be said that this book contains much interesting and useful information for all those who are interested in rural reconstruction and can thus be said to be a timely and welcome publication at the present moment when the attention of the country has been drawn to the importance of rural welfare work.

Sukumar Ranjan Das

WOMEN IN ISLAM. *By M. Fathulla Khan with a Foreword by Baron Omar Rolf Emenfels (of Austria). Published by Moses and Co., 4120 Moosakhan Bazar, Secunderabad, Deccan.*

A small pamphlet of 12 pages, in which the author tries but fails to justify polygamy etc. in the eyes of non-Moslems. It is the priest praising his own scriptures, and prevents rational discussion of any topic connected with religion.

J. M. Datta

SANSKRIT

THE GHERANDA SAMHITA. A treatise on Hatha Yoga. Translated by Sris Chandra Vasu, B. A., F. T. S. (T. P. H. Oriental Series). Theosophical Publishing House, Adyar, Madras. 1933 Price: Indian Edition Rs. 2. Foreign Edition Rs. 2-8. Size—Crown Octavo i-xviii+1-132.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

The work under review gives the text as also the translation of the *Gheranda Samkita*, one of the most important text-books of the Hatha Yoga system. There are incidental references to the description of some of the Yogic processes as found in the *Hathayoga-pradipika* in cases where they differ from those of the present work. In the foreword an attempt has been made to demonstrate the practicability and utility of Yoga practices in general. The learned translator has not, of course, enquired into the question of the date and authorship of the work but the fact that some of the couplets of this book are found not only in the *Hathayoga-pradipika* but also in several other Yoga text-books would indicate as much their popularity as their antiquity. On the basis of the directions regarding the food for one who practises Yoga Mr. Vasu concludes that the author was a 'Vaisnava of Bengal' (Foreword. p. xv). This seems to be going too far, at least in the absence of more direct evidence, in the case of a work which may not unlikely have been merely a compilation or have been subjected to occasional interpolations. The scholarly world as well as the reading public will however be thankful to the enterprising publishing house for reprinting this work (first published in 1895) which goes a great way in helping one to make acquaintance with an original Yoga text ; for though various attempts are being made through the publications of Kaivalyadham and Yoga Institute of Bombay and of other individual scholars to popularize the teachings of Yoga, little has been done in the direction of directly popularizing the original Yoga texts.

MAHABHARATAM WITH BHARATABHAWA-DEEPA : *By Nilakantha. Edited by Pandit Ramchandra Shastri Kinjawadekar. Printed and published by Shankar Narahar Joshi. Chitrashala Press, 1626 Sadashiva Peth, Poona City.*

Here we have a decent popular edition of the Mahabharata along with one of its most popular and learned commentaries *e. g.* of Nilakantha. In portions however, where Nilakantha had no commentary as on the major portion of the Dronaparvan, the commentary of Arjuna Misra has been incorporated. The eighteen books of the work are here completed in six handy volumes. Two companion volumes—one containing the *Harivamsa* and the other comprising introductory materials—will, it is announced, be published in a short time. A good number of modern pictures depicting different incidents in the work are inserted in each of the volumes. The edition is stated to be primarily based on the edition of Ganapat Krishnaji which is no longer available. Several other editions and some manuscripts are also declared to have been consulted but extremely few are the variants that are found to have been noted. Not a single variant reading of the commentary is noticed though the text of it does not always agree with that of even some of the printed editions like the Vangavasi edition published from Calcutta.

The scholar as well as the general public will, on the whole, be thankful to the enterprising publishers as well as the editor for unostentatiously bringing this valuable work with its reputed commentary—long out of print—within easy reach.

In the short prefaces in Sanskrit prefixed to the different parts of the work topics like the authorship and extent of the Mahabharata have been briefly touched upon. In the Preface to volume IV the editor has given his interpretation of the term *jaya* in the line *tato jayam udirayet*. According to him it refers to the Mahabharata. as it indicates in letter numerals the number 18 which is not only the number of chapters of the Mahabharata and the Bhagavadgita but also the number of days occupied by the Kurupandava war and the number of *aksauhinis* constituting the army. The interpretation is, of course, ingenious and seems to be original as no authority is quoted. But it disregards the fact that the line is uttered not only before the recitation of the Mahabharata but of all the Puranas as well.

CHINTAHARAN CHAKRAVARTI

BENGALI

BANGALA PRACHIN PUTHIR BIBARAN (*Descriptive Catalogue of Early Bengali Manuscripts*) *Vol. III, Part 3. MSS Nos. 201-400. By Pandit Taraprasanna Bhattacharya, with an Introduction by Professor Chintaharan Chakravarty. M. A. Pp. 178: Bangiya Sahitya Parishat Publication No. 43 (84): To be had from the Parishat Office, 243-1 Upper Circular Road, Calcutta: Price 10 as. (8 as. for members of the Parishat).*

The Bangiya Sahitya Parishat, which is a national institution for the Bengali speaking people for the study of Bengali literature and culture, has been making for the last 40 years of its existence a systematic collection of early Bengali MSS. and other objects relating to the past and present culture of Bengal. The MSS. Library of the Parishat boasts of the richest collection of early Bengali MSS. as can naturally be expected in an institution of the position and prestige of the Parishat. The MSS. which are typical Indian *pothis* with loose leaves often arrive in a deplorable condition and sometimes huge bundles of MS. leaves from different works all mixed up and in a frightful mess are dumped into the Parishat premises as gifts. The sorting of these and their arrangement into books is often a heart-rending task, but the MS. department has been doing this work for a long number of years. After the books have been laboriously sorted and properly secured within card-board covers and cloth bags their cataloguing with notes of contents can be taken in hand. So far over 3000 MSS. have been sorted and hundreds are waiting to be picked, sorted, and classified and more are always coming in. The work of writing a descriptive catalogue is also being carried on in the intervals of other work and the publication is proceeding as the meagre funds of the Parishat permit. This is a matter which merits fully the sympathetic consideration of the Government of Bengal, the Corporation of Calcutta and other public bodies. The necessity of such collection of MSS. for the literary history of a people can be imagined ; and without a catalogue a collection of this type becomes almost useless for those who are not professionally employed in MS. libraries.

The present volume does great credit to the learning and the patient industry of Pandit Taraprasanna Bhattacharya on whose worthy shoulders has fallen the mantle of Pandit Vasanta Ranjan Ray Vidvatballav, honoured name in Bengali scholarship. The books are properly described with suitable extracts and colophons. The introduction from the able pen of Prof. Chintaharan Chakravarty takes note of the most interesting and important works, and forms a good review of the present batch of 200 MSS. described within. A work like this is an

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

ample justification of a learned body like the Bangiya Sahitya Parishat and considering that out of 3000 MSS. now ready only 400 have been so far described. The necessity for adequate financial support from those who control public funds becomes painfully clear. An alphabetical index of authors and titles forms a very useful feature of this catalogue.

SUNITI KUMAR CHATTERJI

HARAPRASADA GRANTHAVALI: (*Collected Bengali works of the late Mahamahopadhyaya Haraprasad Shastri*). *Published by Sj. Satish Chandra Mukherji from the Basumati Sahitya Mandir, 166, Bowbazar Street, Calcuta. Price Re. 1-8. Pp. Royal 1-342.*

Mahamahopadhyaya Haraprasad Shastri, well-known outside Bengal as only a great Indologist, was also a forceful writer of Bengali. His writings in Bengali were huge in amount and covered different fields—Indology (his favourite subject), historical novels, literary criticism, Bengali philology and social as well as educational problems of the country. A portion of these writings scattered in different places has been brought together and published in the present volume. There is no prefatory note appended to the volume and there is no indication as to the principle on which the selection and arrangement of the different pieces included in the volume have been based. There is no clear reference in the case of a good many of the pieces as to the year and place of their first publication. In spite of these defects, which are almost characteristic of the otherwise valuable *Granthavali* publications of the Basumati Sahitya Mandir, the present volume will be welcome to the admirers of the writings of the late Shastri, inasmuch as it serves to bring into easy reach many of his works that were becoming almost inaccessible. It is refreshing that his fascinating historical novel the *Bener Meye* (the Daughter of the Merchant) which gives a vivid picture of old society and his illuminating appreciation of the *Meghaduta* (the Cloud Messenger) of Kalidas have been included here. But it is extremely unfortunate that some of his best and pleasant reading productions on literary criticism and historical investigation have been left out from the respective sections in this volume reserved for them. It may be expected that these will be published along with the remaining works of the Shastri in a subsequent volume.

CHINTAHARAN CHAKRAVARTI

ASSAMESE

RUKMINIHARAN NAT: *By Mahapurush Sankardev. Edited by Ambikanath Borah, M.A., Lecturer, Calcutta University. Published by the University of Calcutta.*

We welcome this edition of a small one act drama in Assamese which is representative of a class of similar dramas called *Ankiya*. These dramas are stated to have been highly popular in Assam. But it is to be noted that the language of the masses has not been used here. In the words of the editor, 'the language is medieval Assamese mixed with the dialect which is known as Brajabuli.' What is really curious is the frequent use of Sanskrit verses by the *sutra-dhara* for explaining all incidents to the audience It is a relief, however, that on each occasion the *sutradhara* gives free Assamese renderings as well of these verses. The *sutradhara*, here, unlike his prototype in the Sanskrit dramas, does not remain satisfied only by introducing the drama but stays all along on the stage to act the part of an interpreter to the audience. These interesting provincial peculiarities as well as the reference, in the introduction, to the use of scenes on the Assamese stage as early as the 16th century, will attract the attention of students of Indian drama. Elaborate and authenticated descriptions of the Assamese stage and theatrical houses (*Bharanaghara*) would have been all the more welcome. In the edition of a vernacular work like this belonging to the 16th century and possessing immense linguistic interest one would naturally expect variants to be noted. But strangely no variants have been noticed as is done in all critical editions of old texts. Neither has any description been given of the MSS. on which the edition has been based.

LONDON LETTER

PARLIAMENT'S PRESENT SESSION

By Major D. GRAHAM POLE

India's new Constitution

THE chief Bill promised in the present session of Parliament is the new Constitution of India Bill, which will affect no less than three hundred and fifty odd millions of people—one-fifth of the total population of the world. That Bill, framed by the present Tory Government, is not likely to meet either the wishes or the hopes which have been aroused, especially since the Montagu Declaration of 1917, in the minds of the Indian people—by the King Emperor, by Viceroys and by responsible British Ministers. Pledges to India have gone by the board. Leading Tory members of the House of Lords refuse to be bound by them. And Sir John Simon, while admitting "that this country is pledged as clearly as we can be pledged in honour and in policy" declared in the House of Commons that we are bound by that pledge "within our discretion and judgment." It sounds like a new conundrum: When is a pledge not a pledge? The answer, according to Sir John Simon, would be: When according to your discretion and judgment you do not wish to implement it. In other words the Tory Government can treat pledges as scraps of paper, if in their discretion and judgment it suits them better so to do.

Unemployment Insurance Bill

In domestic affairs in Great Britain the most important legislation promised us is in the sphere of unemployment insurance. The Bill they have introduced, amended, and re-introduced, is not a Bill, be it noted, to deal with unemployment, but merely a Bill to deal with the unemployed.

The great battle over the future of unemployment insurance and administration opened last week in the House of Commons. It will be followed with the closest attention and sympathy not only in our own but in all countries. In the first place because the great depression has revealed unemployment as a sickness which has spread to every people alike. And in the second place because in England we have a system of insurance which, with all its anomalies and imperfections, is still the most comprehensive and courageous yet devised.

The new Bill has, in the words of the Minister of Labour, sixty clauses and seven or eight schedules. In commending it to the House of Commons he claimed that it was "the greatest measure of social progress which has been presented to this country by any Government for many generations." This is a very great claim to make. And any measure which aspired to such a description must surely, one would imagine, be the outcome of long and considered judgment. But the first thing which strikes the man in the street about this Bill is the fumbling and tentative manner in which it has been brought to birth.

A fortnight ago, at the end of the last session, the Bill was ostensibly introduced. But on the verge of its discussion in Parliament it was re-issued in a new form, "longer by several clauses" as Mr. Greenwood complained! Again this measure is of the greatest importance to many Local Authorities, upon whom has fallen most of the burden of providing relief for unemployed men and women who had exhausted their right to insurance benefit. But the National Government are introducing this Bill—and its provisions as to the percentage of the burden which the Exchequer will take over—while negotiations are still going on with these Authorities, while they are still at loggerheads with the Association of Municipal Corporations in fact.

The Principles of the Bill

So much for the background; and now for the principles upon which this Bill is said to be founded. The Minister claims they are two—(1) that there should be a contributory insurance scheme covering as much of the field as possible; (2) that outside insurance the State should assume a general responsibility for the relief of the able-bodied industrial unemployed.

Formulas and principles should always give one pause. They are never the worse for being greeted with the words of the poet Robert Browning, "Stop, let me have the truth of that: Is that all true?" And I think if these two principles are reflected upon it will be seen that in the first one the whole question is begged by the words "as possible." While as for the second principle, the word "industrial" is the sting in the tail. There is not going to be any general assumption on the part of the State of responsibility for the unemployed, but only for the *industrial* unemployed.

In considering the first principle it would be tempting to stray into its by-paths. Many people for instance, and including Mr. Arthur Greenwood, the former Minister of Health, believe that unemployment insurance in a capitalist world is a mirage. To give an insurance basis

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

to the relief of unemployment is, in his view, an impossibility. "There never has been an insurance basis to the scheme, and there never can be during the years ahead."

Children Brought in

Whether this is the case or not, the present measure might go a long way towards giving unemployment relief an insurance basis if in fact, as in theory, it covered as much of the field as possible. As every one knows who has had anything to do with insurance schemes, their essence is to rope in everybody and especially the "good lives." In the world of employment, of course, the "good lives" are mostly to be found in the better salaried position and in the professions.

After all this it is pitiful to have to record that the new lives brought into the Insurance Scheme are—children! It is true that the new Unemployment Insurance Statutory Committee (of which more later) is to consider the possibilities of bringing agricultural workers into the scheme. But for the moment the children are the newcomers.

Professional People Left out

What can be the reason for neglecting the opportunity to widen the basis of insurance? As Mr. Greenwood pointed out, at least another 4,000,000 or 5,000,000 ought to be brought in. Many "professional people, black-coated people, superior people" would be glad to feel that if they lost their jobs, and came to the end of their savings, they had something in prospect beside charity or the Poor Law.

One cannot help feeling that the only reason for excluding black-coated workers is the old English little weakness—snobbishness. We dearly love to separate people into those who pay income tax and those who do not, those who earn "wages" and those who have gone one better and attained to "salaries." Respectability in this country (and escape from the irksome duty of licking stamps and sticking them on cards) can be attained if you have climbed to the dizzy height of £250 a year!

No "Doles" For Children

But a word about these children who are coming into insurance. At present although the school-leaving age is fourteen, they are not eligible for unemployment insurance until they are sixteen. Under the new provisions they will be included in the scheme at the age of fourteen whether they go into employment or voluntarily continue at school—in which case they will be credited with contributions. Contributions will be at the rate of 2*d.* a week from the child, 2*d.* from its employer, and 2*d.* from the State.

Having conceded this much to the children, however, the Minister went on to express his horror of "anything which could be described as doles for children." He seemed to feel as bad about it as do the old gentlemen who write to *The Times* decrying those London children who twice a year beg us for pennies—for Guy Fawkes or for carol singing. But the Minister of course is mistaken in talking about giving doles to children. The children would never expect to receive them any more than they receive their wages when they are in employment. Their wages, as any working class child could have told him, are as a matter of course handed over to their parents who have to keep them and who, when they can, allow the children pocket money merely.

So the children will not receive doles. What that will happen is that "where a child between the ages of 14 and 16 is unemployed, and is the child of an unemployed insured person, the parent may get a dependant's allowance." And *how much is this allowance*? Two shillings a week! And it must be remembered that even this meagre allowance will only be paid if the household is already stricken by unemployment. If the father is in work, the child will get nothing for his contributions.

Malnutrition Stabilized

It is very unfortunate for the National Government—but please Heaven it may improve the lot of the unemployed—that at the very moment when they are launching their unemployment proposals, the British Medical Association have issued a report on "the minimum weekly expenditure on foodstuffs which must be incurred by families .... if health and working capacity are to be maintained." In that Report it is stated that "a youth between the age of 14 and 18 requires an expenditure on food alone of 5*s.* 11*d.* a week." More than double the pitiful 2*s.* allowed by the National Government.

The Minister made great play in his speech of the wonderful schemes which the Government had on foot for the benefit of the children. The Bill, he said, provides a very considerable benefit in the form of increased instruction for children. Local Education Authorities are to set up instructional centres, twenty-five per cent of the cost being borne by them and the rest divided equally between the Insurance Fund and the State. At these centres the little innocents, it is hoped, "will gain mentally, physically, vocationally, and industrially!"

No one of course could quarrel with that. But the idealism of the National Government in this connection is, alas, very open to question. The *very next day* after its Minister of Labour had been voicing these admirable sentiments the National Government voted down a Bill to raise the school-leaving age. If the Government really had the interests of all children at heart it would blend proposals for industrial instruction centres with a general scheme for continuing their education. I am bound to say that

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

in the present proposals a shabby attempt on the part of the National Government to stop the clamour for raising the school-leaving age by offering the workers' children something "just as good." Because, of course, a general scheme of education would be paid for by the State and the Local Authorities. But these centres, tacked on to unemployed children, can get paid for partly at any rate out of the Insurance Fund.

Children in Industry

It is worth while considering what raising the school-leaving age might do for the children and employment. In the first place it is absurd to say, as the Government said on Friday, that raising the age would put a heavy financial burden on the State. Children are cutting out their elder brothers and fathers, whose support is far more costly than the 5*s.* a week which is the average cost of educating a child. As Lady Astor pointed out in the debate at Plymouth, where a higher school-leaving age is in operation, 1,000 children are kept off the labour market each year.

But there is more in raising the school-leaving age than its immediate financial implications. It is a long-range economy. In a world of contracting opportunities, people must stay at school long enough to discover what they are most fitted to do. In any event, suppose we accept the Government's estimate of the cost which appears to be "£3,000,000 per annum by the year 1936"), how does that figure compare with our our expenditure on armaments—not to mention new cruisers and a possible expansion of the Air Force to a one-power standard ?

"Crisis" Rates Made Permanent

But to get back to the Insurance Bill, it is of course on its financial provisions that it will meet with the most serious opposition. Almost its worst feature is that it stabilizes the rates of unemployment benefit imposed in the 1931 crisis. The "cuts" are to remain, even though the National Government is always assuring us that prosperity is returning. In opposing this meanness to the worst off members of the community, the Labour Party will be supported by the Liberals.

It is to be hoped that not only Labour and Liberals in Parliament will fight for a restoration of the "cuts," but that they will have the backing of a strong public opinion up and down the country.

The Irreducible Minimum

The Report of the British Medical Association, to which reference has already been made, makes it abundantly clear that the amounts of benefit now in force are quite inadequate to maintain health and fitness. This Report sets out various diets designed to meet the minimum needs of varying families. The diet described for an average family, consisting of husband and wife and three children, is given a total cost of 22/6½*d.* But the maximum unemployment benefit which such a family could draw is 29/3*d.* a week. The balance, 6/8½*d*, could not meet the cost of rent in the vast majority of unemployed households—and yet out of that 6/8½*d.* they must meet rent, fuel, clothing, cleaning materials, insurance and so on. What happens, of course, is that the family goes short on food.

No wonder a leading Liberal newspaper, the *Star*, lets itself go on this head :

> "To the test of human needs and the country's duty to the victims of the Great War, the new Bill will not stand up. It is because they and their brothers and fathers and sons fought for us that the working-classes are in their present plight. *Would any Government in 1919 have dared to propose to treat them as this Bill proposes ?*
>
> "That is the main charge against it, that it proposes to stabilize not the ideals of the war, but the meanness of the slump, not the courage of generosity but the niggling of fear.
>
> "It will try to stamp on the future of England the spirit of fear, retrenchment, cheese-paring and inhumanity which has followed the establishment of the National Government."

Before leaving this question of the "cuts" in unemployment benefit, and the deadly light thrown on them by the publication of the British Medical Association's Report, one other feature should be kept in mind. The Committee emphasized the necessity of giving to children first-class proteins. First-class proteins are meat, flour, bacon, milk, butter, cheese and eggs. And, as the *Economist* points out, "It is therefore altogether deplorable that *precisely those sources of first-class protein and fat should have been selected by our protectionist legislators for regulation and control.*" So the unemployed and the poor are being bled both ways. Their benefit has been cut and their food has been restricted and taxed by the National Government.

Onus on Unemployed

If the worst feature of the new Bill is that it perpetuates the "cuts" in benefit, scarcely less unhappy is the fact that it reinstates the "Not genuinely seeking work" clause, which was abolished by the Labour Government. That clause, as anyone who has had anything to do with the working of the Act well knows, has been responsible for more injustices and bitterness than anything else in the history of unemployment insurance. The Labour Government threw on the authorities the onus of proof—but now it is back on the shoulders of the unfortunate worker.

As the Labour Opposition pointed out in the debate, the Government are trying to rake a little

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

kudos to themselves because, in the case of a man who falls out of work after a period of five years' continuous employment, they are proposing to allow an extension of benefit. (To many of us this sounds like the old injustice, "to him that hath, shall be given.") Such an extension would, of course, mean that the numbers on the register were to that extent swelled. But the National Government need not worry. This screw of the "Not genuinely seeking work" clause will remove far more men than the other condition is likely to add.

The Debt on the Fund

Another injustice perpetuated in the Bill, and one which again the Liberals are expected to join Labour in resisting, is that the debt on the fund, accumulated during the abnormal years of the slump, is to remain a charge on the Fund. Here, one would have thought, is a debt which should be treated like a war debt and carried by all of us. But the Insurance Fund is to bear the burden alone. It owes £115,000,000 and for forty years generations of workers "yet unborn and unbegot" will see their Fund drained to the tune of £5,500,000 a year!

I have dealt at length with these criticisms of the Bill because they are the most important. They almost all, it may be observed, apply to Part I of the Bill—the Part which deals with the *insured* worker. Before passing on to Part II, which deals with the uninsured industrial worker and the worker who was insured but has fallen out of benefit, a hasty word must be said as to the administrative changes which are proposed.

No Parliamentary Control

These changes reflect the spirit of the age in that they are a move towards centralization and bureaucracy—and away from Parliamentary control. An Unemployment Insurance Statutory Committee is to be set up. It is to have three duties, to report to the Government on the finances of the Fund; to consider how to bring agricultural workers into the scheme; and, most important of all, to "advise on draft regulations." The Committee will consist of five, and three of them at any rate will be as follows:—a representative of the workers, one of the employers, and one of Northern Ireland.

But the innovation is the power to "advise on draft regulations." The Committee is to make recommendations which will be embodied in Orders. The *Minister*, apparently, may amend these Orders, and *Parliament* may adopt them by an Affirmative Resolution. But it cannot legislate upon them.

Is this a new tyranny? There may be a lot to be said for taking the administration of unemployment insurance away from politics as such. But there is nothing to be said for handing it over to a bureaucracy. It could only with justice be handed over to a democratically elected industrial body.

Poor Law—Under a new Name

This bureaucratic principle is common also to Part II of the Bill—to the Part which deals with workers outside insurance. By the way, the wildest misconceptions are in the air following on the Minister's statement that the State is going to assume a general responsibility for all the able-bodied industrial unemployed. Yesterday I heard someone declare that "everyone will be going to get the dole in future." Of course the dole is just what they are not going to get. The change is solely one in status. They will go to the employment exchanges for the payment of assistance instead of to the Public Assistance Committees. And even this meagre concession applies to industrial workers only!

An Unemployment Assistance Board is to be set up and will consist of six members. As in the case of the Unemployment Insurance Statutory Committee, it also will submit recommendations to the Minister—and Parliament again will give Affirmative Approval only.

This Board is to be actuated by two considerations. The first is the Means Test and the second is, in the words of the Minister, that "the worker who has been long unemployed may require assistance other than and in addition to cash payments." In plain words this second consideration means that the worker who has fallen out of insurance can be dragooned in industrial centres, if considered necessary, and if that does happen one is inclined to think it will oftener be "other than" cash payments rather than "in addition to!"

One fears for the administration of this section because it is so impersonal and bureaucratic. It is the old Poor Law system shorn of the advantage that it was administered by a representative body of people. The new body will take away from Local Authorities the duty of assessing need. It will administer the Means Test. It will be removed from the criticism of anyone, even of the House of Commons. The Minister will be responsible for general policy only.

Much was made in Parliament about the more or less ethical basis of a Means Test. Roughly this runs as follows. People who are out of benefit become a charge on society. If society has to keep them, then it has the right to enquire into their circumstances. So far, so good—perhaps. But personally I would say that if society has to keep them, then they ought to be given work to do for society, and I would have no inquisitions out of the matter. But the argument continues, "a man should turn to his own family for help in need, before he calls upon the community." And here I disagree altogether.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

The Means Test

I have always believed that every man is his brother's keeper, *every* man. By the same token everyone should contribute according to his ability to the support of his neighbour. Rather than a Means Test I would like to see everyone paying income tax, even if it began at a penny a month from those in receipt of unemployment benefit. In this way we would all contribute according to our ability to the upkeep of the State. There would be no selfish chatter from the better-off classes about "it all comes out of the taxpayer's pocket."

But I condemn the Means Test most of all because it is uneconomic, a great waster of human opportunities and abilities. Making the poor keep the poor means it is impossible for thousands of talented and enterprising people to go out into the world and seek their fortunes. It roots them where they are, in often deadening jobs, in dull depressed towns which they loathe. Better-off people, or the few lucky ones who have escaped, may argue glibly that nothing can keep a genius down and "Where there's a will there's a way" and so on. But the fact remains that only the selfish will slip out from their responsibilities. The rest will plod on, till the vision has faded and they are too tired to care. They will stick in their dull jobs and society, which instituted the Means Test, will be the poorer for the waste of their talents.

London, 4th December, 1933.

PRICES, WAGES AND PROFITS IN THE KHADI INDUSTRY

By MELLY ZOLLINGER and W. LAKSHMANA RAO, M.A., D.SC.

THE research side of any industry has for its goal the rapid and increased production of the finished article; the commercial side has for its object the cutting down of production and distribution costs and the increase of sales. Rationalization, scientific research, "konjunktur-forschung," sales-propaganda—all these demand the co-ordination of the engineer, the scientist and the economist, serving on the general staff of the industry. Khadi industry has yet to learn many lessons which the other organized industries of the world have already learnt. It has already had a foretaste of the cycle of boom and depression and it can certainly profit by the bitter experiences of the highly mechanized industries of this country, without the risk of losing its soul.

The diminished purchasing power of the masses of the world has called forth a new orientation of the principles of production and distribution, and the resuscitation of khadi is in itself an expression of this orientation. And yet the khadi industry seems to have paid as little attention to organize its economic side as to its technological side. Ramshackle *charkhas*, all too wooden gins, combined with old-world methods on the one hand, the futile attempts of a few individual producers to reduce prices to meet the lowered consumption on the other—these represent the industry's efforts to stem the tide of economic deluge. Reports of the various provincial khadi organizations breath more of the musty atmosphere of the counting-house than of the refreshing spirit of economic enquiry. In this article an attempt will be made at outlining the scope of economic research in the khadi industry and at showing how such research will help the producer, the worker and the consumer at arriving at a correct and just estimate of profits, prices and wages.

Production Costs and Wages

A correct system of costing accounts forms the basis of all rational production. It helps the producer in estimating the future demand and the price at which he must sell his article; hence it gives him an idea of the profits he might be able to realize in his forward dealings. On the basis of this, he has to decide the wages to be paid to the different classes of work and whether it would be profitable to increase or restrict his production. In determining the cost of production of khadi cloth, the wages of the spinners and of the weavers form the important factors. The real wages paid to the workers engaged in an industry and its relation to the standard of living can be taken to be a fair index of the prosperity and efficiency of the industry and of its place in the national and social economy. Therefore the determination of the actual and the real wages paid to the spinner and the weaver, occupies an all-important place in khadi economics.

Considerable difference of opinion prevails among Indian economists—who with rare exceptions are orthodox and hostile to the khadi movement—as to the amount of actual wages earned, or capable of being earned by khadi spinners. A section of the critics consider the wages earned by the spinners to be lower than the sustenance wage, and in fact they have no

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

hesitation in stigmatizing hand-spinning as a sweated industry (*vide* Puntumbekar and Varadachari: *Hand-spinning and Hand-Weaving* for criticism of this view). Another school of critics are of opinion that spinners are able to earn high wages owing to the sentimental value attached to khadi (and they cite this as a reason of the high prices of khadi) and characterize khadi as a sheltered industry (see Amalsad: *Hand-Loom Weaving*. Government Press, Madras, 1930. pp. 16, 150). In view of these differences of opinion, we have attempted to arrive at as correct an estimate as possible of the daily wages *actually* earned by the spinners in the Velama and Pattusali section of the Andhra khadi industry.

It would, of course, be necessary to arrive at the real wages earned by the different classes of spinners, as different from the actual wages paid to them. Fine yarn spinners, as a rule, buy cotton on their own account, gin and card it themselves, and sell their yarn at the weekly markets. The coarse and medium count spinners often get the ginned cotten from the weavers or the yarn merchants, who supply them with the ginned cotton. Thus, from the prices they realize, they have to pay the price of cotton, and the carding wages. The remaining amount would then represent the net wages earned by them.

The following wage-sheet (designed in collaboration with Sit. M. K. R. Swamy, Manager, Fine Yarn Centres, A.I.S.A., Chicacole) represents the method adopted in gathering the necessary data and the method of arriving at the net daily wages earned by the Velama and Pattusali spinners:

WAGE-SHEET

Name of Spinner: Tagiti Bhulokamma
Village: Tamada (Ganjam Dist.)
Class of Yarn: Pattusali, Grade 45 count.
Price of Yarn Rs 0-2-6 per tola.
Weight of Seed-cotton given: 6 tolas.
Time taken for:—

(1) Sorting and Cleaning kapas with Fish-jaw	1	hour	13 min.
(2) Ginning	0	„	18 „
(3) Cleaning and Paralleling	1	„	4 „
(4) Carding and Slivering	0	„	8 „
(5) Spinning	1	„	55 „
(6) Winding	0	„	21 „

DEATAILS OF SPINNING

Weight of yarn spun 7/12 tola.
No. of Yards Spun 565.
Calculated count 45.
Price of Yarn spun Rs. 0-1-3.
Spinning-Speed 250 yds. per hour.

YARN TEST:

Average Count (Quadrant)	44
Evenness of Count	39.6 p. c.
Tensility	49.0 p. c.
Uniformity of Strength	nil.

CALCULATION OF NET DAILY WAGES:

		Weight (tolas)	Pr (pi
(1)	Yarn from the given amount of cotton Proceeds of sale)……	0.58	15
(2)	Seeds from Ginning (Proceeds of Sale)	3.00	0
(3)	Waste Cotton (Proceeds of sale)	0.52	0
	Total Sale Proceeds ..		16
	minus		
(4)	Purchase of Cotton	6.00	3
	Net Wages earned		13

TIME REQUIRED IF ALL THE GIVEN AMOUNT OF COTTON IS TO BE SPUN INTO YARN:—

For Preparatory Processes	3 Hrs. 3 mi
For Spinning and Winding	2 Hrs. 23 m
For total working Time	5 Hrs. 26 m
Net Wage per Day of 8-Hours:	19.3 pi
or approximately:	Rs 0-1-7

The data gathered by us according to t above method for the different grades of spinni and in the different locatities, is summarized the tabular statement given below:

TABLE I

Class of Yarn	Count of Yarn	Net Wa per Day 8 Hour
1. Velama (Singipuram)	20-25's	Rs. 0-0-1
2. „ „	25-30's	0-0-1
3. Velama (Devadi)	30's	0-1-0
4. „ „	35's	0-1-2
5. „ „	40's	0-1-7
6. Pattusali (Bonthalakoduru)	35's	0-0-1
7. „ (Tamada)	40's	0-1-7
8. „ (Bonthalakoduru)	45's	0-1-7
9. „ „	50's	0-1-7
10. „ „	55's	0-1-6
11. „ „	60's	0-1-5
12. „ „	60's	0-1-6
13. „ „	80's	0-1-1

From the above table, we gather that net wage earned by the fine yarn spinners ran between a minimum of 10 pies and a maxim of 20 pies per day of 8 hours. Exact data lacking about the wages earned in the coarse medium-coarse sections of the industry. But would not be far wrong in estimating the wages in these sections between a minimum 6 pies and a maximum of 10 pies per day.

One thing, however, stands out clearly. such low wages prevailing in the industry, neither equitable nor prudent to reduce wages below this level and that the way cheapen khadi does not certainly lie in direction of wage reductions.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

There are also other items of expenditure that must be taken into account, before we can arrive at the actual earnings. For instance, allowance must be made for the following items :—

1. Cost of yarn for preparing 'malas' ;
2. Replacement of worn-out spindles ;
3. Expenses for going to market and production centre ;
4. Cost of new fish-jaws for combing cotton ;
5. Lubricating oil for charkha ;
6. Repairs to charkha ;
7. Depreciation of charkha ; and
8. Interest charges on money invested in the purchase and storage of cotton.

Unfortunately it was not possible for us to get reliable data covering the above items. However, as none of these items are very large—except the last—the daily earnings would not be diminished to any material extent.

Wages and Skill in Spinning

In any industry a well-planned wage system should guarantee a minimum wage to the unskilled worker and a progressively higher wage to the skilled worker, in direct proportion to the skill and intelligence required. In the khadi industry, which is entirely based on human labour and is independent of machinery, the planning of an equitable wage system ought to be a comparatively simple affair. Whether the wages in actual practice are so graduated or not, forms the next subject of our enquiry. The following table gives the wages earned in the fine yarn section of the industry, together with details about the present spinning speeds and the time taken for the preparatory processes for the different grades of yarns :

Class and Count of Yarn	Price of Yarn per tola	Spinning Speed Yds. per hour	Percentage of Time required for Preparatory Processes in Total Time : at present speed	at speed of 250 Yds.	Net wage per 8-Hr. Day in pies 1/12 anna at present speed	at speed of 250 Yds.	Percentage of the cost of cotton in the total cost of yarn
1	2	3	4	5	6	7	8
Velama Count 20	Rs. 0 1 1	162	47·0 p. c.	55·5 p. c.	11·6 pies	13·7 pies	25·9 p.c.
„ 25	„ 0 1 5	139	47·4 „	60·7 „	10·5 „	13·5 „	23·0 „
„ 30	„ 0 1 5	170	46·4 „	56·3 „	12·3 „	14·8 „	15·1 „
„ 35	„ 0 1 11	132	39·4 „	55·7 „	14·0 „	22·7 „	11·0 „
„ 40	„ 0 3 9	130	33·7 „	49·0 „	19·0 „	25·2 „	7·8 „
Pattusali Count 35	„ 0 2 2	131	46·4 „	62·7 „	11·3 „	15·1 „	22·5 „
„ 40	„ 0 2 4	265	50·3 „	49·0 „	19·5 „	19·0 „	18·9 „
„ 45	„ 0 2 6	280	56·1 „	53·3 „	19·3 „	18·2 „	19·1 „
„ 50	„ 0 2 8	211	45·8 „	50·0 „	19·9 „	21·8 „	14·5 „
„ 55	„ 0 3 0	217	52·2 „	55·7 „	18·7 „	20·1 „	14·9 „
„ 60	„ 0 3 4	225	45·0 „	48·0 „	17·9 „	19·2 „	15·0 „
„ 60	„ 0 3 6	170	32·7 „	41·7 „	18·3 „	23·4 „	12·6 „
„ 80	„ 0 4 0	156	46·2 „	58·0 „	13·1 „	16·1 „	10·9 „

In judging whether the wages are properly regulated or not, attention has to be paid to two important factors. The output of a higher count spinner is lower than that of a lower count spinner ; for instance, in the Pattusali section, the spinning speed of an 80 count spinner is 165 yds. per hour, whereas that of a 40's spinner is 265 yards. (The difference is not noticeable in the Velama section, where the speeds for all grades of spinning are about equal, and much lower than what they ought to be). Again, a high-count spinner, if her yarn is to be of a good quality, must devote a proportionally longer time for the preparatory processes, than the spinner of the lower count. This necessarily shortens the time available for spinning in the case of the high count spinner. In order to make due allowances for these two factors, so that a direct comparison might be made of the wages that are earned by spinners of the different grades, the wages earned have been calculated at a basis speed of 250 yards per hour for all grades. This removes one inequality ; the other, that of the time necessary for the preparatory processes remaining as a determining factor in the estimation of the wages.

We have now to consider how the prices paid by the producer per tola of yarn compares with wages actually received by the spinner. It is evident from the table that the wages received by the Pattusalis compare unfavourably with those received by the Velama spinners. This is due to the higher prices paid by the purchasers of Velama yarn. This does not appear to be fair to the Pattusalis who are the more skilled spinners, as evidenced by their higher spinning-speed and the greater strength of their yarns in general. In this respect a re-adjustment of the prices offered by the purchasers of Pattusali yarns appears to be necessary. The comparative prices for the different grades of yarns in this section also require a better adjustment. For example, the spinner of the medium counts, *viz.*, 40's-60's, are better off than the spinners of 80's. In fact, the wages received by the spinners of 80's and 35's are about equal, in spite of the comparatively

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

higher speed (count for count) of the 80's spinners (see Table 2).

A great danger threatens an industry when the wages are not regulated in proportion to the skill required of the workers. If the 80's spinner, in spite of the skill and care (witness the high speed achieved by her and the longer time taken for the preparatory processes), and in spite of the high price of 4 annas (the highest in fact offered by the purchaser), is earning much lower than those spinning lower counts, she would give up spinning 80's and resort to spinning only medium counts. This would, in a very short time, lead to the disappearance of high-count spinning. The Pattusali area, which from centuries has been the home of high-count spinning, and which within living memory was producing yarns of 120's and 150's—today usually produces only 60's, and spinners of 80's can be counted literally on one's fingers. It is to be earnestly hoped that purchasers of fine yarn would recognize this danger of the disappearance of high-count spinning and would see that the wages actually earned by the spinners are sufficiently attractive to induce them to continue spinning the highest counts.

Analysis of Production Costs

In order to regulate purchase of raw material, the wages bill and production, it would be necessary to have a knowledge of the factors that go to make up production costs. This knowledge would also provide the consumer with a correct picture of the state of the industry and help to create a healthy interest among the public in its activities and usefulness. The necessity and importance of such an analysis of production costs applies with greater force to khadi, which is to be regarded as a key industry engaging as it does many thousands of the poorest class of workers and which is dependent on the patronage of all the classes of the nation. In the absence of any such analysis of production costs of the different qualities of cloth in the reports of the provincial A. I. S. A. organizations, we have attempted below an analysis for the three different qualities of khadhi produced by the Andhra Branch. (The page numbers refer to the "Report of the A.I.S.A., Andhra Branch, 1929-30," and to the 'Price List' of the same organization, dated 1st October 1931).

Pattusali Section

We have taken as an example the production costs of the quality of cloth having 26 *Punjams* and 54 inches width. The selling price of this cloth is Rs. 2-3-6 per yard (Price List, p. 2.)

In finding out the actual cost of production, we have to deduct the overhead charges from the selling price. As figures for overhead charges have not been mentioned in the report, these have been calculated by us from the yearly balance-sheets of the various production and sales centres appended to the report.

Sale Price: Quality P-26: Width 54 inches per yard (List, p. 2) Rs. 2 3

minus

Overhead Charges :—

1. Yarn-Purchasers' Commission @ 8 pies per Rupee	0	1	3	
2. Establishment & interest charges of production Centres @ 1 anna per Rupee	0	1	10	
3. Head-office Rebate, @ 9 ps. per Rupee	0	0	11	
4. Establishment & Interest charges of Sale Centres @ 15 ps. per Rupee	0	2	4	
	0	6		
Production Cost per yard of cloth	Rs.	1	13	

Items in Production per yard of cloth :—

				Percentage *in total Cost*
1. Weavers' Wages for P/26 ; W/54" (Report, p. 25)	Rs.	0	6	22.4
2. Spinners' Wages for 6 tolas of 40-45 counts of yarn used per yard of the above cloth	1	2	4	62.9
3. Cost of Raw-Cotton (See Table 2, col. 8	0	4	4	14.2
	Rs.	1	13	2

Velama Section

Cloth of *"Punjam* 24" and width 50 inches was taken as an example, and using the same method the following percentages have been obtained :

	% *of total cost*
1. Weavers' Wages	28.4 %
2. Spinners' Wages	61.0 %
3. Cost of Raw-Cotton	10.6 %

Production Costs in Coarse Cloth Section

As examples for this section, two qualities of cloth from two centres were taken, *viz.*, Quality *Punjam* 14, width 54 inches, produced at the Kailaspatam Centre (10 count); selling price Rs. 0-6 per yard; and Quality *Punjam* 18, width inches, produced at the Kanupur Centre (20 count) selling price Rs. 0-10-6 (Price List, pp. 8, Prices of Cotton and wages have been calculated according to those given in Table 3. The different items in the analysis are given below :

	Percentage of net cost Kailaspatam Centre	Kanu Centre
1. Spinners' Wages	20.5 %	50.2
2. Carders' Wages	10.3 %	3.8
3. Ginners' Wages	1.7 %	0.6
4. Weavers' Wages	35.1 %	33.6
5. Cost of Raw Cotton	32.4 %	11.8

Increased Output of Yarn and Cheaper Price

The above analysis of production costs throws light on the possibility of cheapening khadi.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

question of achieving this by a reduction in the scale of spinning wages has been considered in a previous paragraph. A better method is to concert measures to increase the output of yarn per spindle. Spinning-speed among the fine-yarn spinners (see Table 2) is abnormally low, the highest speed being only 280 yards per hour. Speeds in the low-count section are still worse, a speed of 250 yards being very rare indeed. Low speeds and the consequent small output of yarn, is the reason for the meagre wages earned by the spinners. If it is possible to double the speed of the spinner, and thereby double her output, the producers of cloth can then buy their yarn at lower rates and still the spinners would be able to earn an increased wage and the cloth itself could be sold at lower prices.

In the fine-yarn section, spinners' wages account for 63-66 per cent of the net cost of production. A reduction in the prices of yarn, following an increased output can bring about an immediate and proportionate reduction in the prices of cloth. The extent to which cloth could be cheapened depends on the possible ncrease in the spinning-speed higher than that now obtaining. The greatest reduction in the prices for the given small increase in speed, is possible in the Velama section. Here the speeds are abnormally low. In the Pattusali section, where a speed of 200 yards is common, the reduction that would be possible is not very great, though here too an appreciable reduction can be achieved.

In the coarse-yarn section the spinners' wages account for only 50 per cent in the medium section, and to 33 per cent in the coarse section. As the present speeds in Andhra are much lower than those that could easily be possible, the maximum possible amount of reduction in prices of cloth for a given small increase in the spinning-speed is substantial.

There is a possibility for an enormous amount of improvement in the spinning-speeds of the Andhra spinners. Andhra fine-yarn spinners are foremost in the whole country in the spinning of high counts. Yet in the matter of coarse yarn, they lag far behind the spinners of other provinces. In Sabarmati the average speed for 17 counts (medium count) is not less than 400 yards. At the Bangalore Exhibition, Sjt. Keshav Gandhi spun 11 count at a speed of 650 yards per hour. At the Madras Exhibition, he spun 21 count at a speed of 400 yards. Sjt. Devadhar at the Lahore Exhibition spun 14's at a speed of 717 yards. At Bangalore, Srimati Veeramma (Andhra) spun Pattusali yarn of 40's with a speed of 400 yards, and 60's with a speed of 257 yards per hour. In the same competition, Sjt. Keshavbhai spun 50's with a speed of 350 yards.

These records in spinning-speeds demonstrate clearly the great increase in output per spindle that is possible by bringing into use a better type of charkha and by educating the spinners to follow a better spinning technique. In this respect it is to be regretted that the Andhra A.I.S.A. has not taken any adequate steps. The technical department at Sabarmati has proved beyond doubt the enormous possibilities of an improved charkha. Sjts. Puntumbekar and Varadachari, in their prize essay, have also dealt about the possible increase of output that would result from the adoption of better appliances. They give figures of the increase that would result from the use of a better type of spindle. Due to the initiative of the officials of the A.I.S.A. Fine Yarn Centre at Chicacole (Andhra), steel spindles of Sabarmati and Bardoli types were introduced as an experimental measure, (in response to a suggestion from us) among the Velama spinners in their Narasannapeta area. Nine months later (in June 1932), the official in charge of this village, in discussing the results of this experiment, assured us that as a result of the use of the new spindle, the yarn produced at his centre had shown a great improvement in quality, twist and fineness and that the weavers were experiencing less trouble with the yarn than formerly. It was still more gratifying to learn from him that as a result of the introduction of these spindles, the spinners were now able to earn an increase in wages of not less than 3 pies a day. This is a clear proof of how even small improvements in the charkha and spinning technique can bring increased wages to the spinners, accompanied with an improvement in the quantity and quality of the yarn. It would be interesting to know what encouragement and facilities the Andhra Provincial Head-quarters propose to give to their officials on the spot to extend this experiment throughout the fine-yarn area.

Cotton Prices and Cheaper Khadi

From the analysis of production costs we find that the cost of raw material *i. e.*, cotton—amounts to 11 p.c. of the cost of production in Velama cloth (20-40's), 14 p.c. in Pattusali cloth (30-80's), 12 p.c. in the medium coarse cloth (20's) and to as high as 33 p.c. in the coarse cloth (10's). Any fall in the price of cotton, would therefore benefit the consumer, by bringing about an immediate reduction in the selling price of cloth.

Prices in Andhra During 1921-1931

We have already remarked that a perfect system of cost accounts would help the producer in determining his production costs and in fixing his selling prices. We give below a tabular statement of the cotton prices. Wages paid (based on our analyses), yarn prices and the selling prices of Andhra cloth (Kailasapatam A.I.S.A. Centre), together with the actual selling prices and the selling prices calculated by us according to the data in the table, for the period 1921-1931. (The prices of raw-cotton are those

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

ruling at the Tuni market. The information about the wages in the different branches of the industry during these eleven years has been gathered by us from market reports and from reports of producers (private and A.I.S.A.). The overhead charges have been calculated by us at Rs. 0-2-8 per rupee. Cloth of *Punjam* 14 and width of 54 inches produced at the Kailasapatam centre has been taken as the standard for the purpose of calculation.

With regard to the actual and the calculated selling prices, it is seen that the prices at which cloth was sold was much lower than that calculated by us; and that during the last three years the actuals have approximated more closely to calculated prices than during the years befo The lower prices at which the Andhra A.I.S. has sold their production, accounts for the lo sustained by them during these years. T fluctuations in the cotton prices during 1921-2 the subsequent heavy fall, the loss sustained b the depreciation of the cotton bought by the during the period of falling prices, are respo sible for this loss (see Report, p. 35). It is al possible that the Andhra A.I.S.A. has sold i cloth at sacrifice prices in order to popular khadi and to create employment for the gre mass of the proverty stricken population f whom no other is available.

CHICACOLE. November 1932.

TABLE 3

	1921	1922	1923	1924	1925	1926	1927	1928	1929	1930	193

Miss Binapani Mukherjee

Miss Binapani Mukherjee, the grand-daughter of Mr. Sital Mukherjee, charmed the audience with her extraordinary musical feats in the last Allahabad Music Conference. She is a girl of ten only.

Mrs. Saralabai Naik, M. A., Honorary Lady Superintendent of the Seva Sadan, Poona, and Fellow of the University of Bombay, presided at the fourth Ujjain Session of the Gwalior State Women's Conference on November 7 and 8 last.

Mrs. Kamalabai N. Vijaykar has been appointed Honorary Magistrate at Andhori, Bombay. She is the first among ladies to hold such a post over there.

Miss Subarna Ghosh was a student of outstanding merit in the Medical College, Calcutta. She obtained the Gold Medal in Pathology and Calvert's Medal in Medicine, the Goodeve Scholarship in midwifery, F. C. Chatterji's Scholarship in normal and morbid Histology and several College Scholarships. She also received the First Certificate of Honours in Medicine and the Certificate of Honours in Medical Jurisprudence. She has passed the Final M. B. Examination with honours obtaining the 2nd. place in Medicine and 3rd. place in Surgery.

INDIAN PERIODICALS

Two Poems by Tagore

In *Visva-Bharati News* appear the following poems by Dr. Rabindranath Tagore :

Freedom

Freedom from fear is the freedom I claim for you,
My Motherland !

Fear, the phantom demon,
shaped by your own distorted dreams,
Freedom from the burden of ages,
bending your head, breaking your back,
blinding your eyes to the beckoning call of future ;
Freedom from shackles of slumber
with which you fasten yourself to night's stillness,
mistrusting the star that speaks
of truth's adventurous path :
Freedom from the anarchy of a destiny
whose sails are weakly yielded to blind
uncertain winds,
and the helm to a hand ever rigid and cold
as Death ;
Freedom from the insult of dwelling in a doll's world
where movements are started through brainless wires,
repeated through mindless habits,
where figures wait with patient obedience for a master
of show
to be stirred into a moment's mimicry of life.

Greetings

Though I know, my friend, that we are different
my mind refuses to own it.
For we two woke up in the same sleepless night
while the birds sang,
and the same spell of the spring
entered our hearts.

Though your face is towards the light
and mine in the shade
the delight of our meeting is sweet and secret,
for the flood of youth in its eddying dance
has drawn us close.

With your glory and grace you conquer the world
my face is pale
But a magnanimous breath of life
has carried me to your side
and the dark line of our difference
is aglow with the radiance of a dawn.

—

How to Teach 'New Words' in English

Mr. Bidhu Ranjan Das, M.A., B.T. contributes an interesting paper to *The Teachers' Journal* on the above subject. We quote the following passages from it :

No doubt I have made a favourable reference some of the existing text books on English but to sure, most of them have been prepared with no rega being paid to the psychological stages of the develo ment of the language-ability of the child. Let elaborate the point. A child normally learns a langua relating it to his own experience of life and envir ment. Along with the sucking of his mother's bre he learns to utter '*mamma*' next he utters '*papa*' he sees his father fondle him and so on. As experience grows wider with his growth, his vocabul also increases in size and this process goes on ind nitely for a long period. Therefore the words to used in the texts must suit the mental age experience of the learner for whom it is intend The authors in most cases overlook this princi Instead of drawing on scientifically standardised li such as Dr. Thorndike's list of 1000 common wor in English, they rely upon their own judgment introduce words haphazardly. This makes the teachi and learning of English all the more difficult arduous, because, the teacher gets no opportun of working on the bonds of association possessed the learner with a view to making him lera thing. As for instance, if the word "cruiser" introduced in a text book for class III in country, how can the teacher bring home to learner the idea conveyed by the word and how the learner grasp it at this stage? Is not the thi beyond his experience? Thus some authors thinkingly introduce words of the later stages in lessons of the earlier stages and *vice versa*. T acts as a setback to normal progress. "An Engli Primer" by W. C. Wordsworth (for class III) is to my hand. In this book, I find, such difficult uncommon words as "muddy and fertile" introduc in Lesson 25, p. 30 but simple and familiar wor such as "breakfast, kite, lesson" have been reser for Lesson 40. p. 55. Is it not indiscriminate ? this respect, Dr. West's graded series of the method Readers are by far the best in the mark The 'new words" are there printed in bold types the lessons and on their margin. Moreover, scien fically standardised words have been introduced by step in order of difficulty. These words have b repeatedly used to leave permanent impressions the learners. Mr. Guha's Simple Readers and Chatterjee's Readers are the next best.

Now. let us enlarge on the method of teachi 'New. Words' to be ascertained in the manner sketched above. The teacher should take up each the words at a time. He should first of all explain it. as usual, with reference to the context dealt with all its denotations and connotations. He should also try to link it with the apperceptive mass of the learner. He should at the same time bring as many of the derivatives as possible to the notice of the learner. Then he should give the learner a sufficient drilling in the practical use of the "New Words". Herein lies the most important part of the teache

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

work. He cannot neglect it without detriment to the cause of learning or for the matter of fact, the teaching of the language. While doing so, the teacher should invariably detach the 'New word' from the given context. For, the learner of a language should be enabled to use the newly acquired 'word' quite independently in a setting different from that of the text or otherwise the value of this new acquisition will be as good as nil. An example will clear up the issue. Take a short sentence :—"Prem's *parents* love him." Let us suppose that 'Parents' is the 'New word' here. It will not do for the teacher if he merely explains the meaning of the word. He should make the learners drill the word independently. He should ask them to frame with the word such simple sentences as the following :— "My parents love me," "His parents are dead," "You have got your parents," "My father and mother are my parents" and so on. This process is called "*Depolarization*" according to the terminology of modern science. Here it means "detaching a word from its given text and using it independently." Unless the learners become skilled in "depolarizing" a "new word" it is idle to expect that he would acquire a "feeling" of the language within a reasonable time even though he might not spare pains.

—

Indigenous Insurance

Insurance is generally regarded as an importation from the West. It was in vogue in some form or other in India also till recent times. Mr. J. M. Datta has given a very interesting account of some forms of indigenous insurance in *Insurance World*. We make these extracts from it :

On the borders of Barkarganj boats plying on certain rivers sometimes got drowned with all hands on board. The boatmen, mostly Muhammadans, before starting on a voyage sought the blessings and protection of a certain local *Pir* or saint, offered *sirni* and paid 5 pice per head on board to the man in charge of the shrine and thus pledged their lives to the *Pir*. If they returned alive, they would pay 5 pice more, offer another *sirni* as thanksgiving and thus redeem themselves. They believed that the *Pir* took special care in protecting his servants or slaves during the voyage. If they were drowned, the man in charge of the shrine is to provide their widows with food and raiment for a year and a day, so that they may light the lamp according to Muhammadan custom and practice, to illuminate their journey heavenwards, free from all cares.

This practice was in vogue until some 40 years ago when a dispute between two rival claimants to the shrine put a stop to it. One reason for discontinuing the practice may have been the rise in the price of food stuffs and the consequent increased cost of providing for the widows for the specific period, while the amount of traditional charges of 5 pice remained the same. The proportion of persons pledging their lives at the shrine to the number drowned in a year must have been less than the proportion of 10 pice to the cost of providing the widows for a year and a day. That is why the system worked so long as it lasted.

The *Pir's* shrine was unconsciously carrying on the business of accident insurance, and life insurance for a specific voyage combined.

In the days before the advent of steamers and railways, old people, especially old widows, who went on pilgrimage to Benares or to Brindaban or to other distant shrines with a view to spending the rest of their days there, often deposited a lump sum with some honest firm of traders on the understanding that the sum so deposited would be treated as the capital of the firm, and out of it and the trading profits thereon, the person so depositing would get a small monthly allowance sufficient to cover his ordinary expenses so long as the depositor lived. If the depositor lived long, the resulting loss may fall on the firm ; but if he died soon, the consequent gain would be firm's. An ordinary firm would not accept the risks for more than three or four lives at a time ; so it could not be safely asserted that such payments of annuities were made on actuarial principles. But some rough and ready actuarial principles must have been known to them to determine the rates of the monthly allowance depending upon the age and sex and caste of the depositor, for we hear of such principles as that a widow would live longer than a male ; that a Brahmin would live *twice* as long as a Nabasakh, and so forth.

We are told that in former times in such places of pilgrimage as Nabadwip, an aged pilgrim would deposit a fixed sum, say Rs. 500 with the Gossain of a shrine or an *akhra*, and in return he would get board and lodging free for the rest of his life. As a large number of devotees, 20 or 30, would generally stop at a particular shrine or *akhra*, the system had some sort of rough and ready actuarial basis for its success. Any loss that would otherwise fall on the shrine or *akhra*, was generally made good by other occasional pilgrims and devotees. The annuitants, if we may so term the depositors, also helped the institution by doing such odd light manual work as they could easily perform, such as sweeping the gardens, beating cymbals, sewing garlands &c.

—

University Education

Dr. W. S. Urquhart delivered an address at a meeting of the Rotary Club, Calcuta, on "University Education." It has been reproduced in *The Calcutta Review*. The following passage from it should set the advocates of technical education to think about the fate of the unemployed expert :

When we turn to the positive side of the matter we find that the remedy suggested by the critics is that education should be of a less literary character and that it should be more vocational and technical. The knowledge of higher mathematics and philosophy and Sanskrit, does not, it is said, fill the family coffers. Let the training be directly related to the work that is available. Give them the education that will be useful, and stop this waste. Waste, yes, from the point of view of quick returns, but perhaps not waste in the long run. At least do not let us decide the question out of hand. And here again it seems that you are trying to solve an essentially economic problem by a change in educational method. By all means improve your technical education and it will do something. But do not expect it to do everything. It will not make a piece of land which even on the most modern methods can produce only enough food for fifty people, capable of supporting double that number. Your change over to technical

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

education would be an excellent panacea if it were a case of posts waiting until men are trained to fill them. But that is not so. Those turned out of technical training schools find the greatest difficulty in securiug employment, and there are many trained to the utmost pitch of efficiency in the West who can find nothing to do on their return to this country. Now to my mind there is no sadder spectacle than that of the unemployed expert. He has been made ready for only one line and that line is closed to him. He has not the general education which enables him to turn to anything else. He cannot dig, or perhaps, if he is a mining engineer, he can do nothing else; and to beg he is ashamed. He is down and out now because he has been tied down at too early a stage in his educational career. And personally if I had to be unemployed I had rather be unemployed with a full mind than an empty one and a university education does at least profess to fill the mind. I should at least have something to think about while I sat about waiting. When the stomach is empty there is no particular advantage in having the mind empty also.

—

The Child's Education

In a paper in *Prabuddha Bharata* Dr. Maria Montessori writes :

When the independent life of the child is not recognized with its own characteristics and its own ends, when the adult man interprets these characteristics and ends—which are different from his—as being errors in the child which he must make speed to correct, there arises between the strong and the weak a struggle which is fatal to mankind. For it is verily upon the perfect and tranquil spiritual life of the child that depend the health or sickness of the soul, the strength or weakness of the character, the clearness or obscurity of the intellect. And if, during the delicate and precious period of childhood, a sacrilegious form of servitude has been inflicted upon the children it would no longer be possible for men successfully to accomplish great deeds—and we have there the symbolical sense of the Bible story of the Tower of Babel.

Now, the struggle between the adult and the child finds its expression—both within the family circle and at school—in what is till called by the old name of "education." But when the intrinsic value of the child's personality has been recognized and he has been given room to expand, as is the case in our schools (where the child creates for himself an an environment suited to his spiritual growth), we have had the revelation of an entirely new child, whose astonishing charateristics are the opposite of those that had hitherto been observed.

We may therefore assert that it would be possible by the renewing of education, to produce a better type of man, a man endued with superior characteristics as if belonging to a new race : the superman of which Nitzsche caught glimpses. Herein lies the part that education has to play in the struggle between war and peace, and not in its cultural content. Above all it is to be noted that the child, a passionate lover of order and work, possesses intellectual qualities superior by far to what might have been expected. It is very evident that, subjected to the usual education, the child has had not only to withdraw within himself, but to dissimulate his powers, in order to adapt himself to the judgment of the adult who lorded it over him. And so the child performed the cruel task first of hiding his real self, then of forgetting it, of burying in his sub-consciousness a wealth of expanding life whose aspirations were frustrated. Then, bearing this hidden burden, he encountered the errors current in the world.

Thus does the problem of education present itself when we envisage it from the point of view of war and peace, not as a matter of what ought, or ought not, to be taught. Whether we speak or do not speak of war to the children, wheather we adapt history for their use in this way or in that way, does not change the destiny of mankind. But an education that is merely a blind stuggle between the strong and the week can only produce an inefficient man, weakened and enslaved, a man whose growth has been stunted.

—

A School for Defective Children

In *Teaching*, a scientific journal on education appears the following :

The estimated number of mentally weak children [in Bengal, Behar and Assam is over 50,000. How to deal with the mentally deficient or feeble-minded persons, especially growing children, is a problem of first-rate importance.

Public recognition of the claims of such children begin in Europe with Dr. Itard of the Paris School for the Deaf in 1800. In the course of the nineteenth century, Europe and America came to realize that in the interests of both humanity and society such children should be gathered together in special institutions for proper and appropriate training. On humanitarian grounds we should seriously consider and bear in mind that (1) the feebleminded are our children, and we can cannot afford to neglect them without denying our obligations as parents ; (2) that when we have institutions for the blind, schools for the deaf and dumb, asylums for lepers, societies for the prevention of cruelty towards children, why should we not have societies or institutions for the development of those who whave 'less brains' than ourselves ?

On social grounds also, we should remember that (1) A mentally defective child occupies most of the time, attention and energy of the parents, with the result that the other *normal* children tend to be neglected. (2) That defective children as they grow embarrass their parents ; and the general public, not knowing or fully realizing the significance of their real weakness, often unconsciously persecute them by staring at them or calling them by names such as *haba* (idiotic) or *boka* (foolish). The result is that they not only lose what little self-confidence they have, but become positively unsocial, irrational and mischievous little units of society. (3) That just as we protect the general public from infectious diseases by special laws, so we must protect society by having such children specially dealt with so as to keep it safe from any mischief at their hands and by trying to develop them into usefull members of society, if possible.

These considerations lead us to the question—How should we deal with them ? The only answer is— Place them, not only for their greatest well-being but also for the protection of society, in an environment of genteless and understanding and love ; in a place free for the complications that confuse their little

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

brains: guard them from problems and playmates that discourage them and give them a sense of inferiority. All this is possible only in an institution specially established for them. In such an institution a mentally defective child can live in an atmosphere every part of which is planned with forethought and care to recognize his shortcomings and to meet his special needs; where every soul attending him is pledged to the creed of fertilizing his barren life; and where an education is imparted which being specially adapted to him aims to make him economically independent, and to develop the fullest life of which he is capable.

Such an institution has recently been established in Bengal, under the auspices of the Bodhana Samiti, an association for the care and control of the feeble-minded. It is registered under Act XXI of 1860, with a strong committee under the presidency of Sj. Ramananda Chatterjee of *the Modern Review*. The founder-secretary of the Samiti is Babu Girija Bhusan Mukherjee, M.A., B.L., Assistant Public Prosecutor, 24-Parganas. The Rajah of Jhargram made a free gift of 250 *bighas* (more than 80 acres) of land at Jhargram, some 96 miles west of Calcutta. The place is absolutely free from malaria and very healthy; the drinking water is supplied from a natural spring which never dries up.

The whole atmosphere is calm and quiet. Bodhana the name of the institution, was specially coined by the poet Rabindra Nath Tagore. It has already started work with a few children, and Lt.-Col. Owen Berkeley Hill of the Ranchi Mental Hospital has kindly promised to supervise the work of the institution. As it is the first institution of its kind in India, its progress and development will be watched with the keenest interest. In course of time, we hope many such institutions will be established to deal with the large number of mentally defective children.

Those who desire further information may refer to the secretary, 6-5 Bejoy Mukherjea Lane, Bhowanipore, Calcutta.

—

Healthy Feet

To have healthy feet, the following rules should be implicitly observed. These appear in *The Oriental Watchman and Herald of Health*:

The following exercises will strengthen both feet and ankles, and many of them can be performed during the day at odd times.

1. Stand erect. Rise on the toes as high as possible, keeping the feet parallel. Then slowly sink back to first position.

2. Repeat as above, with the feet turned in, and placed wide apart. This is more difficult than the first.

3. Sit on a chair, place one foot on the other knee, and grasp the foot with both hands. Rotate the foot, pushing it as far round as possible very slowly. Repeat with the other foot.

4. Repeat the above exercise with the feet held out in front. Rotate each foot separately, describing a circle in the air. An amusing variation of this exercise is to write one's name in the air. This strengthens the instep and ankles, as well as the muscles of the foot.

5. Walk around the room on the outside edge of the feet.

6. Sit again, holding the feet in. Now stretch the feet gradually downwards as far as possible. Hold the position, then begin to stretch again in an upward direction. This can be done in bed before rising.

7. Walk on tip-toes around the room. Practise this whilst dressing in the morning.

—

Study of Medicinal Plants

These extracts are made from an interesting article in *The Indian Medical Journal*:

Comparative study helps to bring into prominence properties of plants which would otherwise be overlooked. *Cyperus rotundus* forms an important constituent of the Chinese drug "*Hsingfutzu*" and of the Japanese drug "*Kobishi*," used as emmenagogues in that country, a property that is not so prominently mentioned in India. The essential oil of *Cyperus rotundus* deserves to be studied pharmacologically for its action on the generative organs. *Corudalis govantana* ought on comparative evidence to possess the properties of morphia and be useful in Parkinsonian disease.

Comparative study also helps to draw our attention to those indigenous plants which have not been used medicinally by the natives of our country. The study of the Indian *Ephedras* was stimulated by the studies in China. We also now know that not all *Ephedras* possess the charaeteristic properties and some any be entirely devoid of them because of the absense in them of ephedrin and pseudoephedrin. *Ephedraatata* of Morocco is on the other hand a valuable source of ephedrin on account of its very high alkaloidal content whether the high alkaloidal content is due to soil and atmospheric conditions of Morocco, or is due to a characteristic inherent in the plant itself can only be revealed when plantations of the same are made in other countries. Every one knows that plants owe their virtues as medicinal agents to certain characteristic alkaioids, glucosides and other principles present in them. It is being gradually realised however that it is not always be alkaloid that epitomizes in itself the characteristic properties of the plant and deserves to be designated as the active principle. Conessin, the alkaloid of the *Holarrhena antidysentorica* is a good illustration of a fallacious belief. In whatever constituents of the plant the active property may lie, the study of alkaloids serves however a very useful purpose of providing us with an easy and accurate means for standardization of drugs.

Comparative study as in the case of the *Ephedras* or of *Artemisia* would help us to reduce the work of drug cultivation to an exact science, and to determine the commercial possibilities of the most promising plants in the same manner as has been done in agricultural and other economic farms.

Indian medicinal plants ought to be widely studied and largely used by medical practitioners in this country, and should not be contemptuously referred to as "Native Remedies". With proper advocacy it will not be long before the pharmacology and chemistry of the best of them is properly investigated. Such a study even though it be not immediately productive of useful results, might give a new impetus to chemotherapy. If it be remembered that 3 p. c. of the drugs used in the British Pharmacopœia of 1914 were in use among the Egyptians, and 50 p. c. were in use among the Indian and Arab Physicians, there are grounds for the hope that many more gems may be garnered from the rich flora of India, by the application of recent methods of research in chemistry and pharmacology.

FOREIGN PERIODICALS

The Free Press in Russia

The Living Age has the following note on the development of the newspaper press in Soviet Russia :

Whatever else Communism may have done for Russia, it has increased the number of newspapers from 467 to 5,400 and their total circulation from about two million to thirty-eight million. Of these papers 1,760 are district organs and 1,560 factory organs, but their enormous following and the fact that there are ten million readers of newspapers published in non-Russian languages would seem to substantiate the claim of the Soviet authorities that illiteracy has been reduced from 60 to 10 per cent.

Only lack of paper keeps down the circulation and size of Russian publications. New subscriptions are sometimes not even filled—a contrast with the American practice of continuing old ones long after the date of expiration—yet *Izvestia* and *Pravada* both have 1,600,000 readers and *Krestianskaia Gazeta* (*The Peasants' Gazette*) has over two millions, in other words, more than all the newspapers in present Soviet territory had before the Revolution. The daily papers are restricted to four pages and print no scandal. household hints, fashion notes, crossword puzzles, sporting news, or stock-market quotations. Special publications deal with literature and art, and the regular dailies concentrate on foreign news, government decrees, decisions of the Communist Party, and domestic industrial developments. Personality is played down. Except for Karl Radek's political articles, Mikhail Koltzov's humorous essays, and the cartoons of Deni and Efimov the Soviet press, especially in the provinces, tends to a dead level of standardized uniformity.

Functional differences do, however, exist between the various publications. *Izvestia* specializes in general news; *Pravda*, in news of the Communist Party. And the people respond with enthusiasm; newspaper lines in Moscow are as long as bread lines. Printed matter in Russia maintains a much higher level than printed matter in corresponding American publications. Although there are no 'quality magazines' and nothing like the *New York Times*, the masses, for whom all the writing is done, not only get better fare than the American tabloids furnish; they are also fired with the desire to improve their newly acquired skill at reading.

—

King Faisal

Dr. Wolfgang von Weisl gives an estimate of the career of King Faisal in the *Neue Freie Presse* of Vienna :

A clever Orientalist once said : 'The Orientals are happy because they have *The Arabian Nights*. The Europeans are unhappy because they have not.' The Oriental always lives in the belief that Allah metes out compensatory justice. The beggar of today may through luck, cleverness, the intrigues of a beautiful woman, or even through personal merit become a minister, and a minister may suddenly find himself a pauper. Because the Asiatic proletarian believes in this possibility of happiness, he remains socially satisfied. Because the European proletarian does not believe in it, he works for social revolution.

There are still men in the Orient who have had careers typical of *The Arabian Nights*, but even in the Orient a certain change seems to have occurred. No longer does the good will of a eunuch, the pleasure of a pasha, or the love of a princess bring advancement but, remarkable as it may seem, courage, courage, courage—with luck and diplomacy added.

Mustapha Kemal Pasha had such a career, rising from the position of commander of a Turkish army corps on the Palestine front to ruler of modern Turkey. Riza Shah had such a career, rising from non-commissioned Cossack officer to Cossack colonel, then from colonel to Prime Minister and then to Emperor of Persia. King Ibn Saud had such a career. He was born a son of an exiled Arabian monarch and set out at the age of eighteen to win back his father's kingdom, just as the Prince in *The Arabian Nights* goes to do battle against the evil jinnee.

And between these three soldiers ruled a fourth king from *The Arabian Nights*, living in Bagdad, the city of Harun al-Rashid. He too was a new man on the throne, who had also commenced his career on the field of battle. He too was a figure out of *The Arabian Nights*, but King Faisal of Irak was a very different kind of man from his three neighbours. The delicate descendant of a line of aristocratic priests, he adapted himself to the more robust methods of the new politics of the Orient. King Ibn Saud, his southern neighbour, is physically the strongest man in his kingdom, a man of unlimited vital energy who has been married a hundred and fifty times, although he never has more than four wives at once. His western neighbour, Riza Shah, is at least as big a man as Ibn Saud, and, whereas the King of Arabia is a comparatively slender man, the Shah of Persia looks like a Pomeranian *Junker*, bony, muscular, with a square head and powerful jaw. The dictator of Turkey is built in the same way. He is an old soldier who can always summon up his ultimate physical reserves for battle or pleasure.

Faisal of Irak was, as I have said, a different type of man. Medium-sized, thin, and with melancholy eyes, he was always slightly ill, and the climate of his capital did not agree with him. He fled to Europe as often as he could and brought back a love of European customs, fashions, and reforms to his own country, which is half desert, a quarter mountains, and a quarter marsh land. He returned to Bagdad as a foreigner and remained a foreigner there. He was the man whom England

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

protected and wanted. During the World War Faisal served with the 'army' of the famous Colonel Lawrence, who led four thousand Bedouins against the Turks. And by his presence Faisal forced the Mohammedan subjects of the Allied Powers to realize that the war against Turkey and against the Central Powers was pleasing to Allah, for this man who was descended from Mohammed held it his religious duty to break his word to the Caliph and to battle against him.

Courage, as I have said, is well rewarded in the Orient. Because Faisal had been in the field he entered Damascus in triumph after the Allied Powers had defeated the Turks. Because he marched into Damascus, the English made him King of Syria. And when the French, who opposed him, drove him out in the summer of 1920, England had to find another throne for its protégé and made him King of Irak. But this crown did not yield him unmixed pleasure. In spite of the huge sums of money that England poured into this land of petroleum, whose roads and airways lead to India, it remained poor. Less than two-thirds of the population are Arabs. Half a million are Kurds and Turks, who are much more warlike than the Arabs, whom they hold in tremendous contempt. A quarter of a million are Persians, who have recently been casting their eyes across the border, while the million and a half Arabs are at odds with each other. The Bedouins are inclined to sympathize with the Bedouin leader, Ibn Saud, and they show supreme contempt for the Arabian city dwellers and peasants, who in turn are divided into religious sects of their own.

—

Fascism in Japan

An enterprising French journalist obtained an interview with General Araki, the Japanese Minister of War, and obtained the following information from him about the progress of Fascism in Japan. The interview appeared in the *Journal des Debats*, and is translated in the *Living Age*.

I then asked the General a question that had been on the tip of my tongue for a long time: 'What do you think of Fascism in Japan?'

One must distrust certain foreign words,' General Araki declared. 'The Japanese people, use them without understanding their exact meaning. Thus they call the mountain chain that runs the length of Japan "the Alps." While speaking, General Araki was beating the palm of his hand. 'The Japanese people,' he continued 'have a very vague idea of Fascism. Some consider it the negation of all representative government. Others believe it is a movement opposed to Communism. Still others regard it as a force that is hostile to democracy.'

'That is a negative programme,' I interrupted, 'and it might be said that there are all those things in Fascism, but what is the positive programme of Fascism in Japan?'

'I shall not comment on it,' said General Araki, for Fascism in Japan is simply a movement to bring the national spirit to life again, the Japanese spirit that has been transmitted by the laws of the "eternal Emperors."'

For some minutes General Araki had been showing a certain nervousness. The visit of some important personage had been announced and the interview had lasted over half an hour. The clock that I had admired now seemed intolerable, for without any consideration it was continuing to mark the passage of the hour.

'What is the attitude of the Japanese army towards Fascism?' I asked.

'The Japanese army has no occasion to occupy itself with political movements,' the General said. 'Being a soldier means serving the Emperor and his country. But the spirit that animates Fascist organizations, which want closer contact between the Emperor and the people, is the same spirit that inspires the army, a living force and an idea that gives life to the nation. Furthermore, it is the duty of the military leaders to form young soldiers and officers in this spirit, which they should constantly endeavour to raise to an ever higheur level.'

—

The Fruits of Zionism

The *Month* writes about the experiment of creating a national home for the Jews in Palestine:

At the end of October strikes and riots broke out amongst the Arabs in Palestine as a protest against the greatly increased immigration of Jews caused by German anti-Semitism. Arab resentment is quite intelligible: they are the victims of that ill-considered policy called Zionism. No one can be unsympathetic with the desire of the landless Jews to found a National Home, and if the 15 million Hebrews scattered all over the world could be organized as a nation once again in some one region, many inconveniences would be avoided. But, unhappily, there is no unoccupied country large enough and otherwise suitable to house that homeless race, and the original sin of the Balfour Declaration was, without consultation with the inhabitants and against their wishes, to encourage the settlement of large numbers of foreign Jews in Palestine. There was a lamentable loss of life in the late riots, for although the High Commissioner endeavours to combine the policies of favouring a home for the Jewish race in Palestine, and at the same time "of safeguarding the civil and religious rights of existing non-Jewish communities," it is not generally recognized that the two programmes are irreconcilable. No doubt, a wealthy Jewish settler may stimulate the development of the country, but the Jewish process of buying large parcels of land cannot but ultimately dispossess the original owners. The ignorant and indigent Arab should be protected against himself and should not be allowed by the Mandatory to alienate the soil of his country for a little ready cash. The Jews in Palestine, now about one-tenth of the population, are only waiting for a higher proportion of numbers to set up a Jewish State, and reduce the owners of the land to the condition of foreigners.

—

Chinese Ponies and Chinamen

It appears from a note in *The Peoples Tribune* that in the foreign concessions in China racial discrimination has disappeared as regards Chinese ponies but not against Chinese men:

It must be set down to the credit of the foreign sportsmen of Shanghai that there is no racial

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

distinction observed in regard to the admission to the racecourse of ponies born in China. Possibly this is not altogether an unselfish and generous gesture. Perhaps there are reasons for this tolerance which are connected with the difficulty and expense of importing animals from Europe and America for racing purposes. We have never owned a horse, nor even part of a horse —other than a very juicy but tough steak off which we once dined in Paris. We know nothing about racing, and have never sought to conceal our complete ignorance of the subject, nor have we ever professed possession of that invaluable "inside information"— straight from the horse's mouth—which enables followers of the sport of kings to derive much pecuniary benefit from their sportsmanship. But we do know that while a China pony is welcomed to the Shanghai Racecourse a China *man*—or woman—is not. They may, if they so desire, gain admission to the public enclosures on race-days on equal terms with foreigners by buying tickets, but for the three hundred-odd other days in the year when there is no racing they are denied the right of entry and opportunity of exercise which is enjoyed even by dogs. And until last year those Chinese citizens of Shanghai who were not afflicted with myopia enjoyed the inestimable privilege of being able to see a number of more fortunate fellow-citizens disporting themselves on the green sward, defending and attacking wickets and goals and what-not. Now, however, the bamboo-railings which formerly surrounded the Racecourse have disappeared, and in their stead there stands a high brick wall which serves the double purpose of preventing "foreign" fresh air from blowing on Chinese faces and prevents Chinese eyes from seeing things which might possibly lead to the development of what the Japanese call "dangerous thoughts."

—

Religious Census in the United States

Unity writes about the inaccuracy of the religious census in the United States. The observations also apply partly to the religious census in India:

For years—yea, for more than a decade—*Unity* has been laughing at the so-called religious census in this country. We have been deliberately derisive, irreverent, even denunciatory. We have declared that this census, for all the authority of the United States Government, is absolutely untrustworthy, and in its optimistic showing of large increases in church membership, plain downright silly, if not actually dishonest. We have found little support for our skepticism. Religious magazines have gone on publishing the figures as though they meant something; and denominational headquarters, struggling with problems of dying churches and depleted funds, have seized upon these census totals and held to them like a drowning man to a piece of driftwood. Only when the figures did not look so cheerful, when even the census could not turn losses into gains, as in the case of the Unitarians and Universalists, did the editors and secretaries set up a howl. Because of course, no matter what the facts, religion must gain! But now at last *Unity* has a companion in doubt and denial—no less than the Rev. J. Elliott Ross, scholar and teacher, an influential Roman Catholic. In a recent article in the *Christian Century*, Dr. Ross shows what a farce the so-called federal census is. "As a matter of fact," he says, "this so-called 'Census of Religions' is not federal and is not a census." It is simply a compilation of "figures supplied to it (the federal government) by the different religious bodies" themselves. But these figures are utterly unreliable. A recent critic in the Roman Catholic *Commonweal*, quoted by Dr. Ross, spoke of the "unbelievable untrustworthiness" of the Catholic statistics of church membership. The Protestant statistics are probably worse, though Dr. Ross uses language no stronger than "undoubtedly equal valid suspicions" as directed against them. What is needed, says this outspoken *Christian Century* contributor, is a real census—figures gathered by the U. S. Census Bureau in the same way and at the same time that other figures are gathered. He states the difficulties of getting accurate statistics in this field even by this method. But that is not the reason why it will not be done! The real reason is that the churches do not propose to tolerate, much less further, even a partial disclosure of their dreadful plight.

—

British Labour Wins Municipal Elections

America writes about the success of British Labour in the recently held local elections:

Members of the British Labour party were elated at their success in the local elections which were held on October 31. The system governing the municipal elections requires one-third of the members of each Borough Council in England and Wales outside London to be retired annually. By this method one-third political units were affected. The total number of candidates in the field were 857 Labourites, 490 Conservatives, 440 Independents and 113 Liberals. While the returns of seventy-four of the largest towns were tabulated on October 31, the result showed 111 Labourite gains with only two Labourite losses, while the Conservatives suffered a loss of 66 seats. The Liberals of 16 and the Independents of 29. Later figures from 105 towns showed the Labourites had elected 444 candidates, Conservatives 234 candidates, the Liberals had elected 93 candidates, and of the Independents 148 were named. Much attention was centered on the returns from the large towns, as indicating the true barometer of public opinion. The election was fought on the issues of war and peace, the Conservative orators advocating a large navy, army and air force, while the Labour leaders continually stressed pacifism. In a by-election at Fulham the speeches of George Lansbury, leader of the Labour party, elected his candidate in Parliament as the first Labour member ever to represent that district.

INDIANS ABROAD

By BENARSI DAS CHATURVEDI

Foreign Mission of the Arya Samaj

We must heartily congratulate the Sarvadeshika Arya Pratinidhi Sabha of Delhi for bringing out a Hindi pamphlet विदेशोंमें आर्यसमाज containing a brief account of the work of the Arya Samaj in foreign countries—specially in the colonies. The pamphlet contains more than a hundred pages and is well illustrated. One may or may not agree with the religious dogmas of the Aryasamaj or their methods of interpretation or preaching but one will have to admit that the Aryasamaj and the Ramkrishna mission are the two progressive bodies of Hinduism that have done something for our people abroad. Both of them have vast potentialities as foreign missions and can be of immense use to our countrymen overseas in their programme of educational and social uplift.

If the Aryasamajist preachers could get rid of a certain narrowness in their outlook and could adapt themselves to the new conditions in the colonies they can prove more useful even than the Ramkrishna mission whose work on the social side deserves every praise at our hands. Fortunately the present secretary of the Arya Sarvadeshika Sabha happens to be a learned man of wide culture and refinement and can be expected to guide the foreign mission on right lines. Mr. Sudhakar, M. A., is a wellknown Hindi author, a winner of the Mangla Prasad Prize, and he created a very favourable impression as a lecturer in Gurukula Kangri. It is a happy news for the Hindus in the colonies that Sudhakarji has decided to take up this work in right earnest. May we request our colonial friends to supply Mr. Sudhakar regularly with reference books, etc., and to keep him informed of the social and educational work in their respective colonies? His addres is 17, Barahkhamba Road, New Delhi.

We intend to write an article on this subject in these columns in February if possible. In the meanwhile we congratulate once again the Sarvadeshika Sabha and the president Sjt. Narayan Swami for their determination to organise the Foreign mission of the Arya-Samaj. They have already shown commendable courage in condemning those of the Aryasamajists preachers, who have made it their business to frequent the colonies periodically with the single purpose of collecting funds for their private ends. Let them go a step further. Let them condemn without any reservation those preachers also who hold and propagate narrow communalistic views in the colonies. Will they do so?

The booklet *Videshon men Aryasamaj* is priced eight annas and can be had of Sarvadeshika Arya Pratinidhi Sabha, Delhi.

Indians in Fiji

Events are moving fast in Fiji and if they are allowed to take their course we shall soon have a repetition of the tactics of Kenya Europeans in those islands of the Pacific. Horrified at the prospect of Indian voters being given common roll in the municipalities of Suva and Levuka an European gentleman named Mr. H. S. Faddy has ventilated his grievances in the following manner through the columns of the *Fiji Times* and *Herald* of 25th Oct. 1933.

"We all, of course, know of the immense British capital invested in India, and the pressure that it beings to bear upon our politicians, is so much that they would sacrifice Fiji and the Fijians upon its golden altar without the slightest qualm if they can get away with it, but we in Fiji must see that that Trust is not abused.

It is unthinkable that for the sake of political India, or any other cause, the impertinent clamour of a small portion of the Indian immigrants should be listened to, and their claim to political equality in our institu-

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

tions, that directly and indirectly concern the Fijians and Europeans be conceded. It is but the thin end of the wedge, and, will be eagerly fastened upon by the fanatical cranks, whom a foolish democracy has temporarily placed in power in the Home Government, and other concessions will follow closely upon heels until full political equality in the affairs of the colony be given to them and the solemn obligations of the Fijians be wholly abrogated.

His Excellency the Governor of Fiji says that there are only two alternatives in regard to the Municipal governance of Suva and Levuka. Either they shall be run on the lines of the Legislative Council, or we must concede the common roll, which he admits the literarcy test amounts to. We cannot under the latter alternatives exclude even Chinese and Solomon Island or other races.

His Excellency admits that the lack of racial homogeneity and the fact that the preponderant immigrant voter would not surrender his independence of outlook (in plain words would seek to impose their culture upon the European minority) would militate against the success of such an experiment, and so give his weight to the other alternative. But why knowing their unfittedness, and the absurdity of their claims should the thought be entertained at all of sacrificing the European and Fijian to them.

It is your task, gentlemen, to organise your constituencies to fight this pernicious doctrine, and see that the prostitution of our Municipalities does not take place. It should be made plain to these agitators that if they do not wish to live peacefully under the laws and institutions of the land of their adoption they can return to their home land, where they would at least have some justification for their political aspirations. Let us make an end of this policy of hush-hush and this docility when seeing our rights invaded, as authority spinelessly given to every bluff that these people put up."

It is the same old history repeated again. We shall request Mr. Faddy to read the following passage from *Fiji of To-day* by Rev. J. W. Burton who worked in those islands for about ten years and who is now the General Secretary of the Australasian Methodist Mission of Sydney. Mr. Burton wrote twenty-three years ago:

"The Indian is wanted in Fiji. He has come at our solicitation, and we are under some sort of compliment to him for coming to us in our extremity—though we would rather die than admit it to him. He is here because capital must have labour to carry out its plans and the native labour is out question. Even though the Fijian does, as t result of a proper training, cast off his slo and become a worker, he would not be t type required. He is a landowner in a count where land is valuable and is more like to become the small farmer or planter independent means than the serf of commerc Though he rises as an artisan, he will seek t higher rather than the lower tasks. He w not be likely to spend his life cutting sugarca or weeding ditches. Thus the Pharaohs capital cannot hope to press him to bondag He will not make their bricks. Experimen have been tried with native races from oth parts of the Pacific, but they have prove themselves either too expensive for t economical spirit of commerce or else hav been too shiftless and unreliable for t methodical needs of industry. The Indi coolie was given a trial. Though he has body to speak of and seemingly still less so he has shown himself to be so satisfactory th for thirty years now he has supplied the labo for the principal projects of Fiji."

India supplied cheap labour to the F Islands for more than thirty-five years a now that Fiji has been made prosperous t Europeans have begun to agitate against the being given proper position in the colon Lord Salisbury assured the Indians in 1875:

"Above all things we must confident expect as an indispensable condition of t proposed arrangements, that the colonial law and their administration will be such th Indian settlers, who have completed the ter of service to which they agreed as the retur for the expense of bringing them to t colonies, will be free men in all respects, wi privileges no whit inferior to those of a other class of Her Majesty's subjects reside in the colonies."

This promise given by a responsib statesman of the British Government was treate as a mere scrap of paper in So Africa and other colonies after they h benefitted to their utmost from cheap Indi labour. So there is nothing strange in t attitude of the Europeans of Fiji.

May we hope the Indian public will bene by these unhappy experiences and refuse t be duped again by such promises?

NOTES

Who in Whose Pocket

We read in *The Bombay Sentinel :*

> Sir Leslie Hudson hotly denied in the Assembly that the European group was in the "pockets of the Government." We too deny it flatly. It is the Government who are in the "pockets of the European group."

Since administration and exploitation are opposite sides of the same medal, it does not make any essential difference whether the administrators or the exploiters are in the pockets of the other party.

The writer proceeds :

> Since the British Empire is dependent on trade, it is only natural that everything should be subordinated to the interests of Sir Leslie and his friends. No "Lèse majesté" to Schuster there, for facts are facts.
>
> Sir Leslie made his position clear, when he said that the European group stood for "security and stability"—of their own interests ! Sure !
>
> He said his group would support anything to make for a stable government, which benefits India as a whole. What benefits the Europeans, who have the Government in their pockets, must benefit the people. Since the people are in Government's pockets. Very simple logic, all this.

Prevention of Increase of the Unfit in Germany

Berlin, Dec. 21.

Drastic measures will be applied throughout Germany when the law aimed at stamping out hereditary disease comes into force on the 1st of January, 1934.

Four hundred thousand persons suffering from them, of whom the majority are weak-minded, will be subject to sterilization.

Seventeen hundred courts will be established to deal with such cases. The necessary expenditure entailed in enforcing this law is estimated at 14 million marks.—Reuter.

Whether children inherit the qualities or defects of their parents alone or of their grandparents or remoter ancestors also, is a question for biology to answer. Some mentally defective persons have had remarkably intelligent children.

Crimes Against Women

In reply to a question in the House of Commons whether crimes against women were on the increase in Bengal Mr. Butler, Under-Secretary of State for India, said that "the figures did not justify the definite conclusion that this class of crime was increasing." He must have given this answer after consulting the Bengal Government directly or through the Government of India. But many weeks before this reply was given, the police administration report of Bengal for 1932 had been read and commented upon by the Bengal Government on the 17th of October, 1933. The resolution of that Government on the report contains the following passage :

> "His Excellency in Council notes that cases of offence committed against women under sections 366 and 354, Indian Penal Code, showed an increase of 94 over the previous year."

So it was known to the Government, long before Mr. Butler's reply in the House of Commons, that "this class of crime was increasing." Yet some Goverment officer was instrumental in giving Mr. Butler the misleading information that no definite conclusion could be arrived at ! Was this wrong

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

information given because of the ignorance of the officer, or his failure to consult the latest report, or was it a case of deliberate misstatement of facts ?

The Bengal police administration report for 1932 states :

> "Altogether, 234 and 459 cases under sections 366 and 354 respectively, against 212 and 387 in 1931, were disposed of as true during the year, of which 78 cases under section 366 ended in the conviction of 174 persons and 173 cases under section 354 in the conviction of 226 persons."

So in Bengal, in 1932, there were altogether 693 cases of crime against women. The numbers of such crimes in the Panjab and the United Provinces of Agra and Oudh in the same year, according to the police administration reports of those provinces, are given in the subjoined table.

Province	Population	Crimes against women in 1932
Panjab	23,580,852	504
U. P.	48,408,763	711
Bengal	50,114,002	693

The figures for other provinces for the year 1932 are not before us. But there is an impression in the public mind that crimes against women prevail to a great extent in Sind and the N. W. F. province also.

It is necessary to fight this evil. So far as punishment is concerned, it should be deterrent. In Bengal, a reference has been made officially to the bar in all districts enquiring whether in the case of such crimes whipping may be inflicted in addition to imprisonment. The consensus of opinion seems to be in favour of the suggestion that whipping should be inflicted in addition to imprisonment in flagrant cases.

In cases in which the girl or the woman kidnapped or abducted cannot be found, the property of the scoundrels found guilty should be confiscated. It is frequently found in Bengal that girls or women abducted by miscreants are taken from village to village and kept concealed in the homes of friends or relatives (containing their female relatives also) and there repeatedly ravished by the rogues. Those who in this way help the scoundrels to keep the girls or women concealed should also be punished severely.

Castration for Ravishers

It has been suggested in addition that persons guilty of rape should be castrated. Those who are guilty of gang rape should certainly be castrated. As to other ravishers this surgical treatment may be administered in heinous cases.

Viceroy Going Home on "Private Affairs"

The Viceroy and Governor-General being then in Calcutta, the following *communiqué* was issued on the 21st December last from "Belvedere," His Excellency's "camp" :

> The Secretary of State for India in Council has granted short leave not exceeding four months on private affairs to His Excellency the Viceroy who will proceed to England in May next.
>
> His Majesty the King-Emperor has been pleased to approve the appointment of Sir George Stanley, Governor of Madras to act as Viceroy and Governor-General during the Earl of Willingdon's absence on leave.—(*A.P.I.*)

We have neither the right nor the desire to pry into His Excellency's "private affairs." But sometimes affairs of State *are* private. In any case, nothing would stand in the way of the British cabinet consulting Lord Willingdon on the political situation in India and the "reforms" to be "granted" to India.

Suggested Terms of Agreement with Japan and Lancashire

Regarding the negotiations of the Government of India and non-official Indians concerned in the production of raw cotton and cotton textiles in India on the one side and Japan and Lancashire on the other, the December number of *The Insurance and Finance Review* has made a practical suggestion which is worthy of serious consideration. It writes :

> India has got a rare opportunity in this great fight between Osaka and Lancashire. India must import a heavy quantity of textiles every year. She can import it from her best customer. Both England and Japan import all their raw cotton requirements from foreign countries. India can sell at least 30 lac bales of cotton against 1500 million yards of piece-goods import or one lac bale per 50 million yards. The Government of India

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

inform both the importing centres that restricted imports @50 million yards will be allowed from any country purchasing one lac bale of cotton. Will the Government seize this opportunity and help the Indian trade?

The paragraph quoted above is preceded by the following:

England dares not engage herself in an economic fight with Japan. The latter country can hit England on every neutral soil and British business men are aware of this unpleasant fact. For this reason the Indian Government has successively revised the terms offered to Jap delegates in Simla. Anyhow the Government must make a settlement with Japan.

India Government first proposed 250 million yards of Jap textile imports; later on the offer was increased to 400 million yards. To save Japanese competition on neutral soil, the Government will offer many more concessions. We are not aware of the secret negotiations behind the screen. But we can imagine the trend.

"Modern Domestic Economy"

The same journal contains an article on modern domestic economy by Mrs. F. Sylvia Gupta which ought to be read by middle-class housewives in our country. The extract given below is a fair sample of what she, a European lady who has married an Indian gentleman, has got to say.

> Let me give you an insight of the average middle class home, taken at random from some of my numerous friends. This will be on par with the "bhadralok-class" here, and the girls and boys will be of equal social status, intellect, and shall we say, worldly wealth!
>
> First of all, I would like to point out that much money is wasted and mis-spent daily in the upper middle-class Indian household. Too much is thrown away upon style, stylish upkeep, and servants. Fancy foods and luxuries are not at all necessary, and in the middle-class Indian home there are too many servants. Of course, where there are large families and plenty of small children, some domestic assistance is necessary, but where there are several big girls and young women this ought not to be necessary. In the West, however, servants are a luxury. Very rarely does one see more than one maid-servant in a home. Sometimes there may be two—a cook-house-keeper and a general servant—but in such cases either the mother is dead, or unable to cope with the domestic duties due to illness. Also where the house is larger and the family needs greater; a charwoman comes in once or twice a week, for to help with the heavier work, such as scrubbing and washing. Most of the cloths, personal and domestic, such as bed linen, towels and table linen are washed at home. It is considered rather an accomplishment for a young married woman to be able to hang up for drying a well-washed line of linen and shirts, etc., and the young gentlewoman does not feel it beneath her dignity to do so.

Premature Hanging in Lahore

In Lahore, in the case of a man sentenced to death who was in the Central Jail, orders had been sent from the Secretariat to the Superintendent of the jail for postponing the prisoner's execution. But the letter containing the order was not opened and read in time and so he was hanged!

A question having been asked in the House of Commons about this shameful tragedy, a statement was made by the Secretary of State in reply, about which *The Tribune*, knowing fully the facts of the case and the distance between the Central Jail and the Secretariat, observes:

> Unlike the Panjab Government's *communique*, the Secretary of State's reply does not say that the orders despatched by a special messenger on November 20 directing the postponement of the execution were duly received in the jail office. Indeed, the way in which it refers to this part of the regrettable affair is somewhat misleading. "The Superintendent," it says, "did not receive the order till after the execution when he proceeded to his office to open the letters." These words give one no idea either of the shortness of the distance between the Jail office and the Secretariat or of the long interval between the time when the special messenger arrived with the orders and the time when, after the execution, the Superintendent proceeded to open the letters. As a matter of fact the letter remained unopened for a whole day. The most amazing part of the thing is that three weeks after the tragedy the inquiry into the circumstances under which it occurred is still proceeding. How slowly do the wheels of the bureaucratic machine move when our officials are not engaged in the congenial task of political repression!

This appeared in the Lahore paper of the 15th December. It wrote again on the same subject in its issue of the 21st instant, after the Panjab Government had concluded its enquiry:

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

The Panjab Government has come to the conclusion, as the result of "an inquiry held by a responsible officer," that "the primary cause" of the premature execution of a condemned prisoner in the Lahore Central Jail on the 21st November, was "the fact that the envelope containing the orders for the postponement of the execution did not bear any indication of its urgent nature." The *communique* adds that "disciplinary action is being taken against two Secretariat officials responsible for the grave omission and stringent orders are being issued to prevent its recurrence so far as this is possible." We can only characterize this decision as astounding. Does the Panjab Government mean to say that it was not the duty of any higher official in the Secretariat to assure himself that the letter had reached the Superintendent, that it was not the duty of any one in the Superintendent's office to open a letter received from the Secretariat through a special messenger for one whole day, even though it was not marked urgent, and that it was not the duty of the Superintendent himself before he permitted the man to be hanged, to find out by a direct personal inquiry whether orders directing the postponement of the execution had been issued by competent authority. If all these questions are to be answered in the negative, all we can say, as we have said already, is that there is something essentially rotten in the State of Denmark. Most people, who have followed the controversy connected with this most deplorable occurrence will think that the two Secretariat officials are being punished for a criminal blunder, the responsibility for which must be fully shared with them by others much higher up in the official ladder.

And these persons should receive condign punishment. This tragedy has naturally led many advocates of the abolition of capital punishment to restate their arguments.

What is a Terrorist Crime?

The following message has been cabled by *Reuter's* agency :

> London, Dec 21.—The Duchess of Atholl pointed out that the Moral and Material Report gave terrorist crimes in Bengal in 1932 as 97 whereas Sir Samuel Hoare on November 13 gave the figure as 75 and asked for an explanation.
>
> Sir Samuel Hoare replied that he was making enquiries from the Goverment of India. The discrepancy was doubtless owing to the difference in definition. He pointed out that it was difficult in some cases to say whether a crime should be classed as terrorist.

But though "it was difficult in some cases to say whether a crime should be classed as terrorist," it is *absolutely* certain that the hundreds of Bengali young men confined in Deoli, far away from Bengal, *without any sort of trial*, are terrorists ! For are they not guilty of the crime of being Bengalis and young, too ?

Pandit Jawaharlal Nehru's Rejoinder

We are glad to find that Pandit Jawaharlal Nehru has, in his rejoinder, made an *amende honorable* both to the Arya Kumar Sabha and the Hindu Mahasabha in the following terms :

> I must begin with expression of regret and apology. It is clear that some of us were the victims of a hoax in regard to the alleged resolution of the Arya Kumar Sabha which was sent to us and in which it was stated that there could be no peace in India so long as there were any Muslims or Christians in the country. It has been demonstrated that no such resolution was passed by the Arya Kumar Sahha at Ajmer or elsewhere. Indeed no resolution of a political nature was passed by that body at all. I am exceedingly sorry for having permitted myself to fall into a trap of some one's devising, and I desire to express my deep regret to the Arya Kumar Sabha.
>
> I must also express my regret both to the Arya Kumar Sabha and the Hindu Mahasabha for having presumed that they were associated with each other in regard to my main contention.

This is quite worthy of him.

He adds :

> However, I confess that I am unrepentant and I hold still that the activities of Hindu communal organizations including the Mahasabha, have been communal, anti-national and reactionary. Of course this cannot apply to all but can only apply to the majority of members of these organizations. It can only apply to the majority group in them or the group that controls them. Organizations also change their policies from time to time and what may be true today may not have been wholly true yesterday.
>
> So far as I have been able to gather Hindu communal organizations, especially in the Panjab and Sind, have been progressively becoming more narrowly communal and anti-national and politically reactionary.
>
> It is for the Panjab and Sind Hindu communal organizations to answer the charge levelled at them, if they can.

Pandit Jawaharlal Nehru states in effect why he is "unrepentant," and he does so mainly by criticizing two speeches of Bhai Parmanand and Dr. Moonje. As our position is not the same as that of these two leaders, as we have ourselves commented previously on the former's presidential address at the Ajmer session of the Hindu Mahasabha, and as our comments remain unnoticed and unanswered, we shall not say anything on this part of the Pandit's rejoinder. But it is necessary to make a few remarks on the sentences which we have italicized below.

It is perfectly true that the Hindu Mahasabha has stood for joint electorates right through its career and this is obviously the only national solution of the problem. It is also true that the Communal Award is an utter negation of nationalism and is meant to separate India into communal compartments and give strength to disruptive tendencies and thus to strengthen the hold of British imperialism, *but it must be borne in mind that nationalism cannot be accepted only when it profits the majority community. The test comes in the provinces where there is a Muslim majority and in that test the Hindu Mahasabha has failed.*

We perfectly agree that "nationalism annot be accepted only when it profits the ajority community. The test comes in the rovinces where there is a Muslim majority." ut we do not agree that the Hindus have een anti-national in all the Muslim majority rovinces. There are only two major provinces, he Panjab and Bengal, in which the Muslims re in a majority. As regards the Panjab, *he Tribune* of Lahore, which knows the anjab Hindus at least as well as Mr. Nehru, rites :

We do not exactly see in what way the Hindu Mahasabha has failed to satisfy this test in the Panjab. If it has stood for general non-communal representation in the majority Provinces it has, as far as we are aware, stood for no other form of representation in the Panjab itself. As regards reservation of seats, weightage etc., the attitude of the Panjab Hindus, backed by the Hindu Mahasabha, as far as we have been able to understand it, has always been this. Let the same principles be applied to all cases. The best thing, it has consistently declared, would be to have joint electorates pure and simple, without any reservation of seats and without any weightage. But if that is not accepted and if there is to be a reservation of seats with or without weightage, then the Hindus of the Panjab should be treated exactly as Muslim minorities in other provinces are treated. Is there anything in this position which in Pandit Jawaharlal's opinion is a departure from the principle of nationalism ?

As regards the Hindus in Bengal, they were and still are in favour of joint electorates pure and simple without any reservation of seats and without any weightage. But if electorates and elections are not to be joint but separate and if Muslims are to have the number of seats reserved for them in the White Paper scheme, even then Bengal Hindus do not want any weightage—they want simply the number of seats to which they would be entitled on the basis of their numerical strength. Far from having any weightage, which Muslims have got in all Muslim minority provinces, they have been given less seats than even their numerical strength would warrant. They want seats in proportion to their population, *not by reducing the number of seats assigned to the Muslims*, but by reduction of the very excessive number given to the Europeans. Bengal Hindus asked their Muslim fellow-citizens to join them in the endeavour to reduce the seats given to the Europeans. But the Muslims did not agree. If under these circumstances, any section of Bengal Hindus have demanded weightage (of which we are not aware), neither that section nor the entire Hindu community of Bengal should be stigmatized as anti-national. It is not our conviction that Nationalism consists in absolute acquiescence in Muslim claims and utter passivity in the face of grave menace to nationalism from these claims.

We have stated the Hindus' position in Bengal. If the Hindu Mahasabha has ever claimed for Bengal Hindus anything different from what we have stated—of this we are not aware, the Mahasabha alone is responsible for it, not the Bengal Hindus.

Cities—Organic Expressions of Culture

To the ninth anniversary number of *The Calcutta Municipal Gazette*, which is as fine a publication as its previous anniversary number, Rabindranath Tagore has contributed the following message :

Cities are organic expressions of culture. Up till today our cities have grown up, as much

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

of our exterior life has, chaotically. They have been imitations of Europe and their lives have flowed in channels which have been sometimes at tangent, sometimes parallel to our own. Now that India is slowly coming into her own, our towns should mirror our national culture and artistic sensibility. I look forward to a Calcutta which will reflect this ideal.

May it be hoped that this message will receive the serious attention, not only of the municipal authorities of Calcutta, but of its citizens also ?

To the same number of the same journal Mr. Ramananda Chatterjee has contributed a short article on "Cosmopolitan Calcutta" in the course of which he says :

> Human civilization is manysided, and every country, province and region can contribute something to make the ideal of human civilization comprehensive. Hence, the more cosmopolitan a city is, the larger its practical idealism may become, if only all its permanent, semi-permanent and floating population think of it as their home for the time being to which they owe a duty, instead of thinking of it only as a place to make money in or as a pleasure-resort. But it does not strike most of those who make most money in Calcutta that they owe a duty to this city. Had they thought of their duty to it and done that duty, this city would have been a far better place for juveniles to grow up in and adults to live in as civilized and cultured human beings than it is.

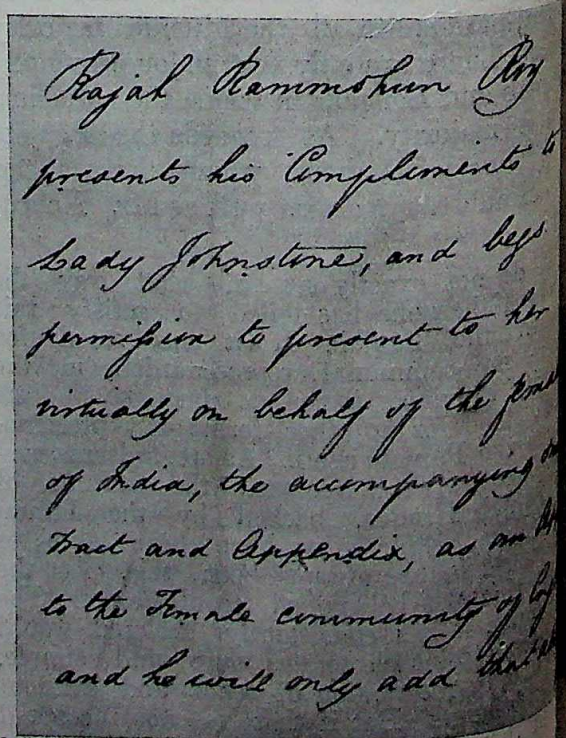
"Abolition of the 'Suttee'," an unknown Tract of Rammohun Roy

The tract to be reproduced in our next issue, written by Raja Rammohun Roy and published by him in England, has not so far been found in any edition of his collected works and has, therefore, remained practically unknown.

It was found, along with some other pamphlets, bound in a volume containing the Raja's (1) *Translation of several principal passages and Texts of the Veds* etc. Allen & Purbury, (2) *Essay on the Rights of Hindoos* etc. Smith, Elder & Co., (3) *Exposition of the Practical Operations of Judicial and Revenue Systems* etc. Smith, Elder & Co., and (4) *Translation of the Creed maintained by the Ancient Brahmins* etc. Nichols & Sons. It appears from an inscription on the title-page of one of these books that they were presented by the Raja himself to Sir Alexander Johnstone, who was a V... President of the Royal Asiatic Society. T... volume was in the possession of Sir Valen... Chirol, who bequeathed his library ... Mr. Lionel Curtis, from whom Dr. S. K. D... Principal of the Forman Christian Coll... Lahore, procured the books on Indian subj... for his college library. And among th... was the volume of Rammohun's works. ... are very thankful to Prof. U. N. Ball of ... Singh College, Lahore, and Mr. Satish Cha... Chakravarti, Joint Secretary, Rammohun ... Centenary Committee, through whose cour... it has been possible to secure this pamp... for inclusion in the collected works ... Rammohun Roy, shortly to be published ... the *Bangiya Sahitya Parishat* (Academy ... Bengali Literature), of which the prospe... will be found among the advertisements ... this issue of *The Modern Review*.

The tract bears the title of "Some Rem... in vindication of the Resolution passed by ... Government of Bengal in 1829 abolishing ... Practice of Female Sacrifices in India." (D... octavo 8 pages with an "Appendix conta... the names of the supporters and opponen... the measure." (Demy octavo, 4 pages.)

The tract bears on its cover an inscrip... in Rammohun's hand-writing, presenting i... Lady Johnstone. The inscription is as follo...



Rajah Rammohun Roy
presents his Compliments to
Lady Johnstone, and begs
permission to present to her
virtually on behalf of the fem...
of India, the accompanying ...
Tract and Appendix, as an ...
to the Female community of ...
and he will only add ...

the former have not had an equal opportunity of mental improvement, they are nevertheless happily acknowledged to be partakers of the nature and capacity of that blessed sex.

48 Bedford Square
April 13th 1832

Rajah Rammohun Roy presents his compliments to Lady Johnstone, and begs permission to present to her, virtually on behalf of the females of India, the accompanying small Tract and appendix, as an appeal to the female community of England, and he will only add that, although the former have not had an equal opportunity of mental improvement, they are nevertheless happily acknowledged to be partakers of the nature and capacity of that blessed sex.

48, Bedford Square,
April 13th, 1832.

There is another pamphlet in the volume, which also should be mentioned. It is entitled "Appeal to the British Nation against a violation of common justice and a breach of public Faith by the Supreme Government of India with the Native inhabitants." This has been republished in India, in the English Works of Raja Rammohun Roy, under the title of "Petition to Government against Regulation III of 1828 for the Resumption of *Lakheraj* Lands." But the London pamphlet is prefaced by a summary which has not been collected in any edition of the Raja's Works published here. It also publishes some correspondence between the writer of the petition and the Government of Bengal and the Chairman and Deputy Chairman of the East India Company, which has so far not been included in any edition of the Raja's Works. All these will now be included in the edition to be published by the *Bangiya Sahitya Parishat.*

Sir Malcolm Hailey, Doctor of Laws

The Allahabad University has conferred the honorary degree of Doctor of Laws on Sir Malcolm Hailey, Governor of the United Provinces of Agra and Oudh.

But of what kind of laws ?

Sir M. Hailey's "Services to Education"

The Vice-chancellor of the Allahabad University in conferring this degree on Sir Malcolm Hailey referred to the services rendered by the Governor-Chancellor to the cause of education. These services must be both direct and indirect. The indirect services were perhaps unconsciously and unintentionally rendered through the efforts made to uphold the majesty of law and order. As for the direct services, would it be fair to measure them by the extent of literacy in the United Provinces of Agra and Oudh which include the region known in ancient times as Aryavarta, *the* home of Aryan culture ?

The following table taken from the Census of India, 1931, vol. I, part I, page 339, tells its own tale :

Province	Number per mille who are literate
Ajmer-Merwara	125
Andamans & Nicobars	170
Assam	93
Bengal	111
Bihar & Orissa	53
Bombay Presidency	108
Burma	368
Central Provinces and Berar	66
Coorg	176
Delhi	163
Madras	108
North-West Frontier Province	49
Panjab	63
United Provinces of Agra & Oudh	55

The Government of the United Provinces of Agra and Oudh may be satisfied with the fact that of all provinces they contain the largest number of universities, and so may their intelligentsia. But can the mass of the people of the U. P. and the real leaders thereof congratulate themselves on their place in the table given above ?

Outcome of Mr. Nehru's Attack on Hindu Mahasabha

One result of Pandit Jawaharlal Nehru's attack on the Hindu Mahasabha has been that he and some other Congressmen have been compelled, for the sake of decency at least, to condemn Muslim communalists also, which they had hitherto avoided doing entirely or as much as possible—though it was the Muslims who started the communalist game. To castigate the mild Hindu with excessive and undeserved severity was easy enough ; let us see how the dynamic Muslim is handled.

Some Bombay Congresswalas, with Mrs. Sarojini Naidu at their head, have issued the following statement :

> It has long been a painfully obvious fact to all dispassionate observers that those organizations which claim to protect the separate interests of communities divided by religion serve only the self-interest of small coteries of exploiters of the religions sentiments of their fellowmen.
>
> They have in the last few years set up artificial barriers against the attainment of national unity. They have encouraged a narrow sectarianism and intolerance which finds frequent expression in riots, and leaves a continuing trail of hatred and rancour. And they have been attempting to release such anti-social forces as would make any attempt at a wider synthesis of human culture ineffective.
>
> It has been our hope that these symptoms are but the passing and irrelevant phases of a new age struggling to be born. We have remained confident that in spite of the disruptive elements introduced into our body politic, the inherent social affinities cannot long remain obscured from the public mind. And in the expectation of this sanity asserting itself we have been content to remain indifferent to the antics of these communal agitators who strut in the pompous authority of artificially incubated organizations.
>
> But recently there has been a coalescing of reactionary forces, a defining of new and vicious attitudes and the development of fresh and dangerous approaches to communal agitation that compel us to express our open abhorrence of such methods. And we congratulate Pandit Jawaharlal Nehru on the courageous lead he has given in the matter. We agree with him, that all such as in the name of religion, caste or community hold unholy truck with the enemies of Indian freedom have to be opposed and fought. And we assure Pandit Jawaharlal Nehru of our support in his war against the blind and rabid communalists in this country.

Mahatma Gandhi on Council Entry

It has been reported that in the course a talk which Mahatma Gandhi had w some Congress workers before he left De he said : "If they thought that Council-en would benefit the country, they should en rather than sit idle ; for the paralytic st should soon end." This is not an injuncti Mahatmaji has simply lifted the ban Council entry, and that perhaps not wh heartedly but rather reluctantly. Still the f is welcome that he considers council en better than idleness. What Mahatmaji insi upon is that the paralytic stage should s end. We think that, though, "harijan" w and khadi work are good in their w congressmen should do some direct politi work, too.

Of course, the time for Council entry h yet to come. But those who are inclined do political work in the Councils and h greater aptitude for such political work rat than for political work of other descriptio should prepare themselves to enter t legislatures.

Mahatmaji's Hold on the Country

British imperialists and perhaps so Indians, too, had been imagining th Mahatmaji's hold on the country h diminished. But the vast crowds who gath to see and hear him wherever he goes tel different story. The combined role of the sa and the socio-political deliverer cannot h appeal irresistibly to the Indian mass-mind.

Soviet Russia's Preparations Against Possible Japanese Offensive ?

According to a Free Press Cable, dat Moscow, December 12, 1933 :

> Apparently with the purpose of promot migration eastwards and thus strengthening Soviet's Far Eastern maritime province agai any possible future Japanese attack, a strik decree, which is to come into operation fr January 1, 1934, has been issued over signatures of M. Stalin and M. Molotov.
>
> 50 P. C. INCREASE TO SOLDIERS
>
> The decree authorizes, in the Far Eas province, an increase of 50 per cent. in t to soldiers and to workers in coal indus a 20 per cent increase to workers in o

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

industries and 10 per cent in the case of white collar workers.

EXEMPTION FROM GOVT. DUES

The decree exempts provinces and collective farms from delivery of quotas of grain to Government for 10 years and individual peasants for five years.

Also, except in regard to certain points, compulsory deliveries to Government of meat, potatoes, butter, milk, hemp, oilseeds and wool have been reduced by 50 per cent. Simultaneously the price paid for fish from collective farms on this Eastern sea-board will be raised by 20 per cent.

Mussolini Versus Kipling

According to Reuter, six hundred representatives from China, Japan, India, Persia, Afghanistan, Siam and Egypt attended the Congress of Asiatic students in Rome, inaugurated in the presence of Signor Mussolini, who, in welcoming the delegates, said that the statement (made by the British jingo poet Rudyard Kipling) that "East and West will never meet" had been proved untrue by history. Twice already during crises the world had been saved by the collaboration of Rome and the East.

And he might have added that in times gone by there was no such sharp division between East and West as exists today as the result of Occidental sense of superiority.

Mahatma Gandhi and Women's Jewellery

According to old style Hindu saints, like Paramahansa Ramakrishna for example, *Kamini* (woman) and *Kanchan* (gold) were both to be shunned, if one wanted liberation. But Mahatma Gandhi wants all the gold that he can get—not, of course, for his own personal use, but formerly it was for the Tilak Swarajya Fund, then for Khadi, and now for "harijan" service.

With reference to women's jewellery, he writes in a recent number of *Harijan* :

"I have seen a paragraph in a newspaper adversely criticizing my appeal to the women for gifts of jewellery and my auctioning things received as donations. Indeed, I would like the thousands of sisters who attend my meetings to give me most if not all of the jewellery they wear. In this country of semi-starvation of a million and insufficient nutrition of practically eighty per cent of the people the wearing of jewellery is an offence to the eye. A woman in India has rarely any cash which she can call her own. But the jewellery she wears does belong to her, though even that she will not, dare not, give away, without the consent of her lord and master. It ennobles her to part with for a good cause something she calls her own. Moreover most of this jewelley has no pretension to art, some of it is positively ugly and a harbinger of dirt. Such are anklets, heavy necklaces, clasps worn not for adjusting the hair, but purely as a decoration for unkempt unwashed and often evil-smelling hair, or row upon row of bangles from wrist to elbow. In my opinion the wearing of expensive jewellery is a distinct loss to the country. It is so much capital locked up or worse still allowed to wear away. And in this movement of self-purification the surrender of jewellery by women or men I hold to be a distinct benefit to society. Those who give do so gladly. My invariable condition is that on no account should the jewellery donated be replaced. Indeed, women have blessed me for inducing them to part with things which had enslaved them. And in not a few cases men have thanked me for being an instrument for bringing simplicity into their homes."

Some Evidence re Steel Industry Before Tariff Board

The Tata Iron and Steel Company's works at Jamshedpur are undoubtedly a national asset. They must be preserved and developed even if the Indian taxpayer and consumer may have to pay directly or indirectly for that purpose for some length of time. But the burden which they are required to bear should not be more than can be proved to be strictly necessary for the continued existence and development of the works, nor should the taxpayer aud consumer be taxed longer than is necessary. Hence, when the Tariff Board has been considering the desirability of a further extension of protection to the Tatas, the question should be threshed out from all points of view.

The Consumer's Point of View

Pandit Nilakantha Das of Orissa, in the memorandum submitted to the Tariff Board and in his oral evidence claimed to represent the interests of the consumers of iron and steel products. His oral evidence has been thus summed up in *The Statesman*.

The Pandit urged that giving protection by means of a tariff was detrimental to the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

interests of the consumer and if protection must be given, it should be given by means of a bounty.

In his memorandum Pandit Nilakantha Das maintained that the policy of protection by means of tariffs tended to serve three distinct interests—the Government of India who wanted more revenue, the capitalists and the promoters of Imperial or "British" preference—but it militated against the interests of the consumer. If preference was thought necessary, it should be provided by conventions of quota purchases or purchases of particular articles even at a loss. "That kind of direct dealing would be free, healthy and manly. But a planned preference to be worked automatically under a system of protective tariffs should be stopped at once in the interests not only of the consumer but of national economy and national morality."

The Pandit concluded :—

"I am not a free trader. I yield to few in my anxiety for giving all reasonable help to our national industry, and the general taxpayer of the land must not refuse to do so. But we must not imitate the methods of other countries, nor be carried away by theoretical arguments of interested parties. Temporary help should be provided for our basic iron and steel industry if by facts and figures it is convincingly and conclusively proved that an extension of the present help is necessary in the interests of the real economic future of the country. But any help necessary must take the form of bounties to particular firms and industries."

In the course of his examination by the President, the witness admitted that he was not competent to deal with technical questions and that the Tariff Board were the competent body to do that. What he was chiefly concerned with was that there should be an expansion of the steel industry, that nothing should be done which would turn the industry into a monopoly of one concern only, in which case the poor consumers would be the sufferers.

Pandit Nilakantha Das has supplemented the brief report of his evidence in *The Statesman* in the following paragraphs for our use :

"Tatas are the only basic steel producing concern in India, and therefore all protection is contemplated for the Tata Company alone. The maximum annual production of steel of the Tata Company is estimated at 600,000 tons. The normal annual consumption of steel in India is more than double of this quantity. Thus Tatas at best can supply less than half the Indian market. In such a case, evidently, bounty is the only solution ; for why should the consumer be made to pay to the state on more than half the quantity which India is not expected to produce in future ? At present, galvanized-sheets are protected with a tariff of Rs. 83 per ton and it sells at Rs. 236 per ton. With all the duty Tatas' production has reached up to only one-third of the Indian consumption. Still the Government goes on taxing the consumer to this enormous extent for no benefit to him. The consumer is thus being ruined, and that in these dire days of depression,

"Tatas have submitted a representation to the Tariff Board. They have not said a word as to how they have directed their activities towards expanding steel industry in India, how they have fostered subsidiary industries like foundries, rolling or sheet mills, engineering works, etc., or how they have worked for the promotion of village artisans by putting their own scrap and other suitable material in the Indian market. On the contrary, they have been exporting basic materials, like pig iron, billets, etc., as also scrap at a much cheaper rate to foreign countries. For instance, pig-iron is sold to foreign countries at Rs. [illegible] per ton. The Indian consumer gets it at not less than Rs. 75 (now reduced to Rs. [illegible] per ton. Scrap is sold to Japan only through Japanese firms here at Rs. 20 to Rs. 30 per ton. It is never sold to any Indian consumer though that also contains the article the village artisan badly requires. The result is that foreigners get cheap raw materials to compete in our market and Tatas want more and more protection. In the sales policy there are combines with competing firms here and also there is discrimination in the sale of raw materials."

"Freight concession which is a part of the protection is used for the same end. All this results in a pernicous monopoly and corruption deadly detrimental to the development and expansion of Indian steel industry. In short, all small industries are killed to eliminate internal competition. But under Indian circumstances these defects are rather inherent in a system of indefinite protection by tariff duty. Therefore if protection is thought necessary it should take the definite form of bounty, in which there may be no waste of taxpayer's or consumer's money nor may there be corruption in the industry. The giver of it will know exactly where he stands and the receiver of it will feel responsible and directly answerable."

The Indian Mining Federation's Point of View

Rai Bahadur A. C. Banerjee and others gave evidence before the Tariff Board on behalf of the Indian Mining Federation in relation to the Tatas' application for a further

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

term of protection to the iron and steel industry. In their memorandum the committee of the Federation observed :

> The Indian section of the coal industry had been little benefited by the growth and development of the steel industry in the country for the obvious reason that steel works did not use second class coal. They therefore asked the Board to investigate whether second class coal could be economically and profitably used in steel works and, if so, it should ask the industry to use second class coal as much as possible. The Committee considered that if the use of second class coal was feasible it would not only reduce the works cost but at the same time help the Indian section of the coal trade considerably.
>
> The next point to which the Committee drew attention was the economic utilization and preservation of India's caking coal. They suggested that it was desirable to close down entirely all Tata's collieries and to ask the Company to buy all its requirements from the open market. The immediate result of this would be that the Company would not only get its coal at cheaper rates but would also have a considerable quantity of caking coal in reserve for future contingencies.
>
> The Committee fully believe that for the present industrial development of India discriminatory protection was necessary from time to time, but they were at the same time of opinion that such protection should not be of a permanent nature and be a burden on the consumers, and it should not encourage inefficiency.

Confirmation af some Conclusions of Ramaprasad Chanda

Sir Herbert Risley's *Census of India*, 1901, published in 1903, first drew Mr. Ramaprasad Chanda's attention to anthropology, and he undertook to collect ethnographical data from ancient Indian literature and take measurements of the sub-castes of the Brahmans and the Kayasthas in Bengal, Bihar and the United Provinces along lines laid down by Risley. The results of his researches were embodied in a small volume entitled : *"The Indo-Aryan Races, A study of the Origin of Indo-Aryan People and Institutions,"* published in 1916 by the Varendra Research Society of Rajshahi. In this work Mr. Chanda endeavoured to establish these propositions :

(1) Risley's Dravidian type erroneously included another distinct physical type called Pre-Dravidian of some anthropologists and presented the ancient Nishada stock described in the ancient Sanskrit literature.

(2) The so-called Aryans of the Rigvedic period named by him Vedic Aryans were not physically homogeneous, but included men of two different races, one blonde and the other dark.

(3) The broad-headed elements in Risley's Turko-Iranian, Scytho-Dravidian and Mongoloid Dravidian types (excluding the Mogoloid tribes and castes of the North-Eastern borderland of Bengal) are akin to the Alpine race and probably originated in the Pamir region of Central Asia.

The creeds now popularly known as Hinduism, *viz.* Saivism, Saktism and Vaishnavism are of non-Vedic and some of them pre-Vedic origin.

The excavations at Harappa in the Panjab and at Mohenjo-Daro in Sind by revealing the remains of a highly developed pre-Vedic civilization dating from the beginning of the third millennium B. C., confirmed the anticipations of Mr. Chanda. In 1929 he published *Survival of the Prehistoric Civilization of the Indus Valley* (as Memoirs of the Archaeological Survey of India, No. 41) wherein he endeavoured to show that in that remote age the pre-Vedic population of the Indus Valley practised Yoga and worshipped images in the pose of Yogi like the images of the Buddha and the Jinas. As pointed out by Sir John Marshall (*Mohenjo-daro and the Indus Civilization*, p. 54) seals discovered subsequently at Mohenjo-daro confirmed this hypothesis. Sir John Marshall has, with very good reasons, identified a four-head image engraved in a seal seated in the posture of *Yoga* as the prototype of Siva. The recent researches into the racial distribution of the blood groups, as pointed out by Dr. Hutton in his *Census of India, 1931 Report* (pp. 451-452), also indicate Alpine affinities of the population of the middle zone of India extending from Gujarat across the Deccan plateau to Bengal. Among the skeletal remains unearthed at Mohenjo-daro Colonel Sewell and Dr. B. S. Guha recognize a Mediterranean type forming the bulk of the population, a Mongoloid type, and Alpine type, and a Nishada type (called by them proto-Australoid and by others Veddoid).

National Trades Union Federation

The first session of the National Trades Union Federation, held at Bombay on December 24, 25 and 26, 1933, was presided over by Mr. Mrinal Kanti Bose. In the course of his address, he referred to the reasons why the White Paper has given so little to Indian Labour.

> No people get more than they deserve. If the White Paper has yielded us workers so little,—it is much less than what has been allowed to the bourgeoisie—we need not pretend to be surprised. This should make us search our hearts. Leaders of the working class movement have been few and the right type of workers fewer. What sacrifice we of the Labour Movement have made, compared to that of the followers of the Indian National Congress ? I know the difficulties in the organization of Labour. The lack of education and the dire poverty of the workers are enough difficulties apart from the hostility of the employers and the want of leaders and workers. The followers of the Indian National Congress are the intelligentsia and many of the leaders and workers of the Congress are wealthy men. They can far more easily raise lacs of rupees for organization and propaganda, than we can a few hundreds. Making allowance for all this, we have to confess that we should have been able to do more. I have given most anxious thought for days and nights and for years on the matter. I am convinced that we have got to make a wider appeal for Union workers and make our platform wider than what it is.
>
> Even the Whitley Commission have taken the labour unions to task for their lack of self-reliance. They say :
>
> 'There is already a lack of self-reliance and a tendency to wait too much upon the employers' attitude. No amount of encouragement from employers or of assistance from the State, can infuse life in the unions which have nothing vital in themselves ; true vigour can only come from within. In those countries where the movement is strong, it owes that strength mainly to its own efforts and perhaps more to the opposition it has confronted than to the support it has received from employers.'
>
> Had the Whitley Commission been a body of Socialists, they could not speak with greater frankness and truth. It gives me great pain to say it but you all know that this is the bare truth, that our Unions have practically degenerated into petition-making bodies and activities of most of our so-called living Unions are confined to writing petitions for individual members dealing with their special and individual grievances.

He proceeds to ask, where to get mo workers and the right type of workers ? H answers is :

> In my opinion, the workers must be fou from the vast body of the educated unemplo ed. My communist comrades may sneer me and ridicule the idea of getting the as stance of the bourgeoisie to fight for t proletariat. My daily duty brings me touch with the type of the unemployed whom I am speaking. Their poverty a misery have brought them down to the le of the proletariat. Within my limited exp ence, I have come across the fin materials among them quite fit to soldiers and in time to be leaders of proletarian movement. What many of th lack is not the temperamental equipment, t the power of initiative. The field for Lab organization is immense. It can suppor considerable number of the unemployed if t latter can call into play the resourcefuln to organize unions and have the comm honesty to render account of the fu collected by them.
>
> It is the duty of the present leaders the working class movement to find out a train workers for the movement. I q agree with the observations of the Whi Commission on the need of paid officials the Unions, and the prospects of these offic in the way of emoluments. The Commiss observe :
>
> 'What is required is the paid official w has been an actual worker. He must be p by the Union, since it is impossible to exp that heavy labour involved will be carried for nothing ; the nexus of payment bri responsibility by making the officials dep dent on the Union and its fortunes. recognize that the present income of m Unions cannot meet such charges ; but organizing official, if he is even moderat competent, will secure a substantial incr in that income. The few Unions which h such officials have found them profitable vestments, and the expense must be face a Union is to acquire strength.'
>
> If an 'actual worker' who has worked the industry, is not forthcoming, a non-wor educated, honest and with spirit of enterp must be found.

The speaker rightly condemned comm labour organizations. Said he :

> The Labour movement had long been from the virus of communalism. But could not possibly expect immunity for time in view of its pervading influence in political field. We of the working movement must do our utmost to shake movement off this poison and to prevent

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

further nroad. There are many ways of doing it, but one I wish to suggest to you. No person connected with the Labour movement should be a member of or countenance in any way the communal organizations, Hindu, Mahomedan or any other. The canker of communalism is a by-product of the scramble of the educated few for loaves and fishes.

"All-India Trade Union Congress" at Cawnpore

It is much to be regretted that there is division in the camp of Indian Labour. Hence we find one organization meeting at Bombay and another at Cawnpore. Of the Cawnpore meeting, the following report has appeared in some dailies :

> Cawnpore, Dec. 23.
>
> The All-India Trade Union Congress commenced its session this evening in the Trade Union Congress pandal. That the trade union movement is rapidly gaining in strength in India was evident from the fact that a large number of delegates from the different trade unions all over India attended. After the Chairman, reception committee and the President had read their addresses, Pandit Jawaharlal Nehru delivered his speech.
>
> Speaking as Chairman of the Reception Committee Pandit Surya Prasad Awasthi referred at the outset to the loss sustained by the working classes at the death of Pandit Ganesh Shanker Vidyarthi whom he characterized as a valiant champion of the poor and the down-trodden.
>
> He regretted the disunity among the rival camps of the Trade Union Associations today when the condition of the working class has become more precarious than it ever was. This disunity was responsible for the reduction of the wages and also retrenchment of the workers in large numbers.
>
> Unfortunately, he said, at this critical hour the Indian working class was not able to present a united front to the capitalist and imperialist offensive. He thought that the condition of the workers can be improved only by strengthening their organization and not petitions and deputations.
>
> The immediate task of the moment, he concluded, was the mobilization of the working classes to give a united front to all vested interests which was making their position from bad to worse.—United Press.

Rabindranath Tagore in Bombay

The Indian Social Reformer of Bombay writes in its issue of December 2, 1933 :

> Rabindranath Tagore has been having a wonderful reception in Bombay. The public has been moved by the sight of the venerable figure patiently sitting in front of the stage watching the audience as the enchanting world of light and colour and sound and rhythmic movement of his creation, unfolded itself before its enraptured vision. The Excelsior theatre has been crowded from floor to ceiling every day. It is pleasant to know that the Viswabharati's burden would be appreciably lightened by the success of the plays. The poet has been in great demand in other directions also. The students of Bombay have been able to persuade him amidst his incessant engagements to give them an address. The Exhibition of paintings in the Town Hall has called attention to the many-sided activities of the great international institution which the genius of the Poet has raised at Bolpur. About this time last year, Bombay was holding its breath in suspense awaiting the issue of Gandhiji's fast at Yerravda. It has had a veritable feast of the soul in the visions of beauty and the words of profound insight which the Poet has given us in this memorable week.

Visva-bharati Rural Reconstruction Work

[Mr. Rabindra Mohan Datta, M. Sc., of Panihati has sent us the note printed below.]

Mr. Strickland, I. C. S., C. I. E., sometime Registrar of Co-operative Societies in the Panjab, in a small book edited by him under the auspices of the Indian Village Welfare Association of England has spoken disparagingly of Rabindranath's attempt at rural reconstruction. Let us see whether he is justified in his remarks or not. We shall give some extracts from the latest official publication on the subject, *viz.*, Annual Report on the Working of Co-operative Societies in Bengal for the year ending 30th June 1932.

First with regard to the training of Supervisors, the report says :

> New recruits to the rank of Supervisors are···given a practical training in their duties and are required to obtain a certificate of competency from the Bengal Co-operative Organization Society.···For a variety of reasons, it was not possible for the Bengal Co-operative Organization Society to hold a training class during the year under report. But the annual training camp of the rural reconstruction workers was held by the Rural Reconstruction Department of the Visvabharati with the assistance of the Bengal Co-operative Organization Society. (Para. 9.)

The Government would not have selected Visvabharati as the training centre, if the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

method of work there was not of the highest kind available in Bengal.

Secondly, with regard to the Rural Reconstruction Societies, the report says :

> The number of these societies increased from 6 to 7. They generally worked well, the foremost among them being the societies organized by the Rural Reconstruction Department of the Visvabharati at Sriniketan. There are ten such societies organized by the Rural Reconstruction Department of the Visvabharati. Six of them are doing useful work, but they have been tabled under the head anti-malarial societies. The Ballabhpur Society has introduced spinning in their idle hours and has got a fly-shuttle handloom for weaving yarn spun in the village. It maintains a free night school. Besides the filling up of *dóbas* and the clearing of drains it assists its members to take up kitchen gardening, while it trains the female members of the village in needle work, embroidery, tailoring, etc. The Bandgora Society also works on similar lines and has excavated a tank with a view to removing the scarcity of water in the village. Four other societies have through their Co-operative effort built a two-storied mud house worth Rs. 450 for the purpose of establishing a dispensary and a laboratory for research work on medical problems. The dispensary and the laboratory are now in charge of Mr. H. G. Timbers of the Societies of Friends. (Para. 58).

The Bengal Administration Report for 1931-32 speaks thus of the Poet's work at Visvabharati :

> The number of these societies increased from 6 to 7. They generally worked well, the foremost among them being the societies organized by the rural reconstruction department of the Visvabharati at Sriniketan.

This is only one aspect of the Poet's work with regard to rural reconstruction. We wonder why Mr. Strickland was tempted to make such irresponsible remarks against the Poet. We would not have said anything but for the fact that the booklet is distributed free in some quarters.

Water Hyacinth Menace in Bengal

Mr. Jatindra Mohan Datta, B. L., writes to us from Panihati :

"The Government of Bengal sometime in 1921 or 1922 wasted some Rs. 30,000 in trying one Mr. Griffith's method of eradicating water-hyacinth by spraying. From time to time sporadic efforts have been made by Government to control the menace, without any results. The life-history of plant or the technical scientific side has been studied ; but unless it can be demonstrated the poor cultivator that he can utilize it economically for his field, such purely scientific research is bound to remain barren. The Imperial Council of Agricultural Research has allotted money to Madras and Bihar, but nothing to Bengal, though the waterways of Bengal are highly infected with this water-hyacinth menace. We would draw the readers' attention to an article by Mr. P. K. Bose in the *Modern Review* for August, 1933. Will the Imperial Council allot some money to Bengal, or will the Government of Bengal press for some money for practical research as to how best to utilize it economically ?"

Steel Required for New Howrah Bridge

A paragraph recently appeared in the papers informing the public that all the steel required for the construction of the new Howrah bridge would be purchased in India *except* a certain quantity—and that is a large quantity—of steel of high tensility which was alleged to be unavailable in India. During our recent visit to Jamshedpur we inquired of the steel experts in Tatas' Works, with the extent and usefulness of which we were highly impressed, whether they could not or did not make steel of that particular description. We were told emphatically that the paragraph was quite misleading.

If large orders must be placed with the British iron and steel manufacturers, those who want to do so ought not to have recourse to misleading propaganda ; they should have the frankness to say that they desire to discriminate in favour of Britain and against India.

Reviews and Notices of Vernacular Books

We are glad to inform our readers that with effect from the present issue of the *Modern Review*, we resume the publication of reviews and notices of books in the principal vernaculars of India.

Governor of Bengal on the Terrorist Movement

Sir John Anderson, Governor of Bengal, said in the course of his speech at the St. Andrews' Day dinner in Calcutta :

> There must be many people better qualified than I to give an accurate diagnosis, but most, I think, would agree that it originated in and to a large extent represents today an effort—a desperate effort—on the part of certain elements of the Hindu community to advance the interests of that community.
>
> Whether they genuinely regard the interests of the community as identical with a wider national interest seems to me for this purpose immaterial in face of the significant fact that the movement is essentially a Hindu movement. That does not, of course, mean that the whole Hindu community should be stigmatized. Far from it : there are active terroists relatively few in number : there are those who sympathize—unfortunately far more numerous, but the Government has every reason to recognize with gratitude the loyal and steadfast service and support given by a vast body of Hindus in public service outside.
>
> Now, why should the movement make so strong an appeal to the limited section of the Hindu community to which I have referred ? It can only be because the general atmosphere is favourable to the propagation of subversive doctrine. And why should this be ? Opinions may differ on the point ; but I, personally, think that part, certainly, of the reason is to be found in the gloomy tinge that the outlook, both political and economic, is apt to assume for the Hindu intelligentsia—the educated middle class, the *bhadralog* youth. I can understand that—to some extent at least.
>
> So far, however, as the political outlook is concerned, I would venture to say this. With the development of democratic institutions, in which they avow their faith, the Hindu could not hope as a minority community in Bengal, to maintain intact the privileged position which in the past they have undoubtedly enjoyed under British rule. They gird at the communal award : that is a subject I am debarred from discussing. The award stands, as everyone knows, unless it is either rejected by Parliament or modified by agreement. But one thing can be said with confidence : under the new constitutional arrangements the Hindus will not and cannot be deprived of the opportunity of taking their part and pulling their weight in the public affairs of the country, except in so far as they themselves may spurn that offer. In my judgment, therefore, their political outlook is not nearly as black as it is sometimes painted.

So, in Sir John Anderson's opinion terrorism is essentially a Hindu and a Bengali movement. But this diagnosis is not correct.

We are not sure what he means by calling it "essentially a Hindu movement." *Ahimsa* (not-killing, non-violence) and toleration are the highest ideals of the Hindu religion and culture. Of course, texts can be quoted from Hindu scriptures in support of war and the use of force, and Hindus have fought and used force as a matter of fact. But these are not characteristic of them and their culture exclusively or to a greater extent than of other religious communities and their culture.

The use of poison gas in war was introduced by the Christian nations of the West. Perhaps its use is still confined to these Christian peoples, for Japan or China or Turkey is not known to have used it in warfare. Even if they have, most of those who have hitherto used it are their discoverers, the Christian peoples. Bombing non-combatant civilian populations from aeroplanes is a similar device discovered originally and for the most part made use of by Christian peoples. Would any one, therefore, be justified in calling these methods of warfare "essentially" Christian methods ? Certainly not.

If by calling the terrorist movement "essentially Hindu"—he does not call it wholly or exclusively Hindu, probably because he knows that there have been and are non-Hindu terrorists also,—Sir John means that Hindu terrorists form the majority of the terrorist party, he is correct. But there is nothing especially noteworthy in that fact. Hindus form the majority of the population of India and of its educated section. Even in the provinces of Bengal as at present constituted, the minority community of Hindus contains the majority of educated persons. So, it is the Hindus who respond more quickly and to a greater extent to external influences of various descriptions than the next largest community in India, *viz.*, the Muslims, who went in for Western education later. For this reason, the Congress and other non-violent movements, which follow Western methods, are also essentially Hindu movements in the sense that the majority of their workers and adherents are

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Hindus. Just as non-violent Indian movements have adopted Western methods, so the terrorist movement, which is violent, owes its inception to European ideas and has adopted European methods. As in the case of non-violent movements, so in that of the violent terrorist movement, the majority of workers and adherents are Hindus. There is nothing surprising in that fact.

But even if all terrorists were or are Hindus, an adequate explanation of that fact should strike all political thinkers acquainted with facts as they are in India. Of course, whether our supposition is correct or not, only the leaders of the terrorists, whom we do not know, can say. Let us state what our supposition is. Terrorists are liable to the extreme penalty of the law. Hence it is reasonable to assume that they would admit to their ranks only such persons as they consider worthy of their entire confidence and as are prepared to face death and would not betray them. The evidence produced in many conspiracy and other similar cases has shown that the object of the terrorists is to establish an independent Indian republic owing not even the shadow of allegiance to the British Empire. Hence they would naturally refuse to seek recruits from the ranks of all who are loyal to the British Government, all who are loyalists, all who want only Dominion Status, and all who want the substance of independence within the British Empire. It is perhaps for this reason that Moderates or Indian National Liberal Federationists, Muslim Leaguers and other Musalman communalist loyalists, Dominion-status-seekers and substance-of-independence-seekers have not been found among convicted terrorists or suspected terrorists. There is a particular reason for including Muslims of some descriptions in the list of parties mentioned in the foregoing sentence. The British Government has bestowed the highest praise for loyalty on the Muslim community and the leaders of that community have also declared their loyalty more often and more emphatically than the leaders of any other community.

Sir John Anderson seems to think that the terrorist movement is confined to Bengal, originated in Bengal, and is born of Bengali Hindu despair due to quite recent political events, possibilities, and proposals such, for instance, as those contained in the White Paper. But the facts are quite different. Terrorism did not originate in Bengal, and it was not and is not confined to Bengal—though Bengali terrorists appear to have undergone more training and acquired more experience. Owing to more persistent and longer disturbed conditions and repression in Bengal than elsewhere, terrorism has been longer and more prominently in evidence in Bengal than elsewhere.

Having been in India for a comparatively brief period, Sir John Anderson does not know, but his advisers ought to have told him that terrorism appeared in India and Bengal before the publication of the White Paper proposals, before the sessions of the Pseudo-Round Table Conference, before the peregrinations of the Simon Commission, before the Montagu-Chelmsford reforms, nay, before even the Morley-Minto reforms, when the gloomy outlook for Bengali Hindus foreshadowed in the White Paper scheme was non-existent. The terrorist movement is not a child of Sir John Anderson's regime, not of the present lustrum, nor even of the present decade. It is a Frankenstein of the British period of Indian history older than the present generation of youthful Indian political suspects. Therefore, it did *not* originate in, nor does it at all represent "an effort on the part of certain elements of the Hindu community to advance the interests of that community." Sir John's diagnosis is utterly wrong.

The terrorists kill Hindus and non-Hindus alike. So far as Indians are concerned, they have killed more Hindus than non-Hindus. And so far as we are aware or can recollect, almost all, if not all, the non-official house-holders whom they have robbed, wounded, maimed or killed, are Hindus—though there are in existence well-to-do and rich non-Hindus also. Is that even the criminals' way to advance the interests of the Hindu community? A queer way indeed!

The territorists may be the very incarnations of Satan. But Satan was not a fool nor are the terrorists fools. They, like the rest of their countrymen who are non-violent, find that the Muslims are being given a really "privileged position" by the British

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Government, because they declare their loyalty and do not join the ranks of the agitators in considerable numbers. If the territorists wanted to preserve for the Bengali Hindu community its so-called "privileged position," they should have become loud loyalists instead of being detested terrorists.

Sir John Anderson obviously had serious doubts regarding the correctness of his diagnosis that the terrorrist movement was a Hindu communal movement for the promotion of Hindu interests alone ; for he indirectly suggests the question "whether they [the terrorists] genuinely regard the interests of the [Hindu] community as indentical with a wider national interest," but refuses to discuss it on the question-begging plea that it seems immaterial because "the movement is essentially a Hindu movement." But to prove that the movement is essentially a Hindu movement, it would be necessary to prove (1) that it has its roots deep in Hindu religion, culture and character, and specially in them, which is not true, (2) that all terrorists past and present have been and are Hindus, which is not true, (3) that terrorists have robbed, wounded, maimed or killed only, or at least mostly, non-Hindu officials and non-officials, which is not true, and (4) that the confessions, and secret correspondence and other documents of terrorists seized up to date filed as exhibits in cases tried in law-courts, have shown that they are a Hindu communalist organization for the attainment of communal objects, which is not a fact.

In Morley's *Recollections* there are a good many references to terrorism and terrorists, but none which lends the least support to Sir John's diagnosis. There are similar references in Buchan's *Lord Minto*, but none which Sir John can quote for his purpose. He cannot find anything in Sir Valentine Chirol's writings to support his conclusions. Dr. Zacharias's recent book on *Renascent India* mentions and describes terrorism in at least fifteen different places, but no passage in it would serve to keep Sir John's diagnosis in countenance. The Government of India's publication *India in 1931-32*, published a few weeks ago, devotes about nine pages in three different parts of the book to an account of terrorism, aud the Government of Bengal's *Report on the Administration of Bengal 1931-32*, received about a month ago, devotes about 8 pages in two different parts, to an account of terrorism and the measures taken to eradicate it. But those official publications also leave the Bengal Governor's assumptions severely alone.

So he can certainly claim originality.

He calls the Hindus' position in Bengal a "privileged position." But the position which the Hindus have acquired was not the gift of the British Government or of anybody else. They acquired it by their ability and industry. Hence to speak of it as a privileged position is misleading. Government is giving the Muslims a privileged position, no doubt.

His Excellency appears to have a peculiar idea of democratic institutions. Democratic institutions exist in his own country. Is there any division of seats in Parliament there according to religious communities ? Has any deliberate effort been made there to pull down any class or community by statute from the position which they have acquired by their education, ability, and public spirit to a position of inferiority and impotence ? Is there any law in Great Britain which prevents a minority community from winning any number of seats in Parliament which they can by their ability and public spirit ? Is there any law which compels a minority community or class there to be content with less seats in Parliament than even its numbers would entitle it to, even though it were the best educated, the ablest and the most public-spirited, and contributed by far the largest portion of the revenue to the public treasury ?

His Excellency has avoided discussing the so-called commuual "award." But, if he could have defended it, we are sure he would have done so. For, no law or rule or convention stands in the way of an officer of the British Government supporting and applauding its policy and proposals. Let that pass, however.

Sir John Anderson says, "the Hindus will not and cannot be deprived of the opportunity of taking their part and pulling their weight in the public affairs of the country, . . ." So far as non-official public affairs of the country are concerned, this is true. Perhaps, when the new constitution begins to operate, the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Hindus will have to be more active than ever, in order to establish a constitutiou of a far different kind. But so far as those public affairs are concerned which are in any way controlled by Government, the White Paper proposals have seen to it that the Hindus may not pull their weight. Those proposals or some arrangements worse than those which they foreshadow, are likely to come into effect. Let us assume, however, that nothing worse than the White Paper Seheme is in store for us. Now, many things are meant by "weight," such as numerical strength, character, intelligence, education, ability, public spirit, enterprise, wealth, etc. The Hindus have not been given even the number of seats which even their numbers would entitle them to. Whatever character, intelligence, public spirit, taxability, etc., they may develop, these will not help them in a legislature in which they are to be in a hopeless inexpansible and fixed minority. How, then, can they pull their weight?

So far as the Hindus' political outlook depends on the sense of justice of the present human rulers of India, it is black, though it may not be "*nearly* as black as it is sometimes painted," whatever that may mean. But so far as their future is in their own hands, it need not be black. It may be very bright, if they are men.

Many British politicians have tried to make the world believe that, not to speak of other non-communal and non-violent organizations, even the greatest of Indian non-violent non-communal political organizations, the Congress, is a Hindu organization for attaining Hindu objects. These British politicians seem to hold the opinion that in India men can work only for the selfish ends of the community in which they were born: a Hindu cannot work for the welfare of non-Hindus, a Muslim cannot work for the welfare of non-Muslims, and so on. It is only Englishmen who can work here for Indians, who are not their kith and kin. Hence, if in the opinion of numerous high-placed Englishmen even the greatest Indian Congress leaders, enjoying the respect of Indians and non-British non-Indians, are not to be credited with having laboured for national welfare but only for selfish communal interests, no wonder that Sir John Anderson should believe that terrorists, who have no reputation, no fame, no name, and who are condemned by all their articulate countrymen and foreigners in India, can work to promote the supposed interests of only a particular community. But we are unable to understand how their acts and methods can advance the communal interests of that particular community.

Dr. B. C. Roy's Presidential Address

In his presidential address at the 26th annual conference of the All-India Medical Licentiates' Association held last month at Bombay, Dr. Bidhan Chandra Roy stated that the status of Medical Licentiates had remained what it was a century ago and referred to the supercilious attitude of the European members of the I. M. S. towards Indian medical practitioners. He formulated a plan for establishing a single brotherhood of medical men and for a uniform standard of education. In his opinion the India Medical Council Act contained an unsatisfactory scheme of reciprocity. He dealt with the vital question of the supply and manufacture of drugs in India and dwelt upon the need of encouraging the industry under the control of trained medical men and not of capitalists. He also pointed out that there ought to be an adequate supply of properly trained and equipped pharmacists, compounders, nurses and midwives. He concluded by calling attention to the financial distress of the medical profession and suggesting remedies. Said he:

> While the Association rightly concerns itself with various problems which are of interest to the profession, nothing can concern its members more intimately than the provision of their bread and butter. On account of the present financial depression this problem has become more serious. The people cannot pay for professional services and a large number of them now resort to Charitable Institutions for advice and treatment. I am intimately associated with one such Institution in Calcutta, the Chittaranjan Seva Sadan and I admit that the demands made upon it leave no room for doubt that even making allowances for those who are able to pay and yet resort to hospital, there are yet an increasing number who come there because they find it difficult

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

to pay for treatment at home. These institutions, I am afraid, will in future go on multiplying and I have no doubt that they will surely affect the income from private practice. What are we to do then? Are we to discourage this tendency to make such charitable endowments? Shall we refuse to work in these institutions, particularly when most of them demand from us honorary services? Self-interest will give an affirmative answer to both questions. We are however proud to belong to a profession, which is not only dubbed "noble" but which is founded on self-restraint and self-abnegation. It is the medical man who discovers methods of preventing diseases, it is the medical man who lays down the laws of healthy living. And in doing so, he sacrifices his own income. And yet he has to live, he has to meet the ordinary demands of life.

He proceeded to state what is done in the West and suggested what may be done in India.

In the West, Panel system, Club system, have been introduced to meet this difficulty. In some States of America, every medical man is paid from the State and they treat patients free. In England Municipal Corporations in urban areas and the County Councils in rural areas have established dispensaries on co-operative system. It is difficult to say which plan will suit us best. I feel strongly that our hospitals, while making ample provisions for the poor, should charge those who are able to pay, on a graded scale. Such payments are to be demanded not on the basis of additional comforts provided to them but on their capacity to pay. Out of such proceeds a certain proportion may be paid to the doctors, the amount received by each individual will depend on his ability to attract patients for treatment and reduce the general incidence of taxation. I think it is prudent to take a middle course and have a certain number of free beds and the rest paying.

"Sympathy with Terrorists"

Mr. S. C. Mitra, M. L. A., occasionally asks questions relating to prisoners in the Andamans, detenus at Deoli, detenus in the Mianwali Jail, etc. One day, Sir Harry Haig, the Home Member, when answering one of such questions last month, took exception to so many questions being asked relating to the details of the health of detenus. His view was that "the continued publication of these allegations conveyed a mischievous effect in Bengal, as it served to keep alive sympathy with the terrorists as individuals and in that way stimulated some sympathy with the movement with which they were connected."

The detenus have not been found guilty after any kind of trial—they have had no trial at all. They have been deprived of their liberty on mere suspicion. It cannot be said that, though there is convincing proof of the guilt of these suspects, they cannot be brought to trial because of the risk which witnesses must run; for persons accused of political murder or attempted murder, of conspiracy, of possession of bombs, and similar offences, are being frequently tried without any witnesses being threatened or murdered. Hence, the very fact that the detenus have not been brought to trial is proof presumptive of their innocence, in the opinion of the public. Therefore, when Sir Harry Haig calls them terrorists, he simply begs the question. Moreover, even convicted murderers are entitled to humane treatment, and if there be any suspicion in the public mind that they are not getting such treatment, it is the duty of the members of councils to ask questions relating to their treatment. As there is a suspicion in the public mind about the treatment received by detenus, who are not convicted prisoners, and as they appear to be subjected to greater restrictions as to interviews and correspondence than criminals imprisoned after regular trial, there is every justification for asking questions about their health, etc. Such men cannot be treated by the public as if dead and gone and buried in oblivion.

Even in the case of convicted criminals, if there be suspicion that they are not treated as they ought to be, sympathy with them as ill-treated persons is not necessarily sympathy with their crime.

If Government want to put a stop to questions relating to detenus, the Indian constitution should be so changed as to put an end to terrorism. And then there will be neither real terrorists, nor persons deprived of freedom on the suspicion of their being terrorists.

"Devaluation" of the Rupee

The question whether the Rupee should bear an official relation with the pound sterling

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

as measured by Re. 1 : sh 1-6d or Re. 1 : sh 1-4d has raised a tremendous controversy all over India. People of every shade of opinion and every grade of scholarship and learning have joined in it and added to the general misunderstanding of this complex subject. It is, of course, now a *fait accompli*, on account of the verdict of the Legislative Assembly, that the Rupee is to be officially equal to sh 1-6 ; and one might think it waste of labour to expatiate on the Rupee-sterling ratio at the present moment. Still, as Indian Finance is fickle as a deltaic river, in that it changes its course often and suddenly, it may not be entirely idle to try to understand its possibilities for future reference. Greater minds than ours have, no doubt, tried to throw clear light on the subject ; but owing to their having thought *unlike*, the man in the street has been more confused than enlightened by the controversy. So that there is still room for the lesser men to attempt to make it less abstruse to the general public.

The word devaluation has been used in this connection by all the participants in the debate. This would have been correct if the Rupee really had any fixed gold value ; for the pound-sterling itself having lost connection with gold has no fixed value and the Rupee being merely an artificial attachment of the pound-sterling is equally non-valuable. Most of the currencies of the world these days adjust their values according to the exigencies of international or internal trade. Thus when any country wishes to increase exports, its currency is manipulated to assume a lower international value. Example Japan. When again, a country wishes to increase internal prices, it inflates its currency as a means to stimulate internal trade. Example the United States of America. When, on the other hand, a country (or its rulers), wish to force up the purchasing power of its currency artificially it contracts the issue of paper-money, thus creating a shortage and a fall in the general price level. Example India and its 1 sh 6d. Rupee, which cut both ways, because the English buyers of the Rupee gained more than what they lost by being able to buy more raw materials in India then with one Rupee than they could buy before that with eighteen annas. So that increasing or lowering the international or internal value or purchasing power of a currency in these days has no sentimental meaning, any more than free trade and protection have. What should concern practical minds is whether by a certain measure of increase or decrease in the international or internal purchasing power of a currency a nation is going to gain or lose general prosperity and to what extent. Attempts at calculating the *real value* of a currency by means of worthless index numbers appear to us only ridiculous although such attempts have an appearance of learning. "Quis accurate loquitur nisi qui vult putide loqui ?"* (Seneca). If the Rupee had been fixed to the pound-sterling at a ratio of sh 1-4d. it would have very likely increased our exports to the degree more or less, as it would increase if our exportable commodities were just now sold at a price about 10 to 12 per cent below present prices. If along with this "devaluation" in the worlds market, the Government had also done a little inflation as would have become necessary to help the increased commerce, the internal trade would also have gained a little strength owing to the tendency to increasing prices, as this measure would have no doubt brought about. This "devaluation" would also have reduced our foreign imports and helped Swadeshi manufacturers and would have created a strong balance of trade in our favour. As all interested people know the tremendous export of gold from India was very largely due to the attempt of the Government to keep up the 1 sh-6d. ratio. The Government of India were very keen on keeping up this ratio as a 1 sh-4d. Rupee would have cut down English exports to India substantially. As a matter of fact all the arguments in favour of the 1 sh-4d. Rupee could be easily found in the government's attitude. What the foreign traders desire strongly has been usually found to be our bane.

Arguments against having a 1 sh 4d. Rupee are not wanting. The most forceful one is many, and many a word of selfless wisdom has

* "For who studies to speak too accurately that does not at the same time design to perplex his auditory ?"

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

been uttered under its stimulus, is that it would increase the price of foreign imports. It would, for instance, increase the cost of all projected industrial plants, of imported paper, textiles, yarn for cloth or hosiery, metals, alloys etc. If there is loss of imports there is loss in Customs revenues and the burden of balancing the budget would rest elsewhere. It would make it easier for foreign capital to creep into India. But against these it may be said that such increased prices will help the growth of the Indian machine making industry and other industries although it may inconvenience temporarily some Swadeshi industrialists who depend largely upon foreign plant and imported raw, and half-manufactured materials and, often, on foreign ingredients which they merely mix or just pack up for sale.

Then again in the case of loss of revenue the demand for raising more money out of the country directly will arise. But every intelligent person understands that these indirect taxes are ultimately paid by the buyers of foreign goods. If they do not any more buy these goods, a surplus of unspent wealth will be left with the people and they will be better off to pay further taxes. If a group of Swadeshi manufacturers grow up to replace the imports, they will also pay taxes. In any case no country should be worse off to pay taxes because they do not spend on foreign goods. The question of Home charges is also important. We shall have to spend more in Rupees to meet these charges. Will this mean so much loss as would counterbalance all our gains? We do not think so. Lastly if foreign capital flows our way we should protect our interests in other ways than by refusing it admission.

The ideal currency for India should be independent of all artificial links. If we could have a Gold Standard (assuming that the other great trading nations will also get back to the Gold Standard sooner or later) that would be the best. If on the other hand we have a managed currency, we should manage it for our own benefit and not for that of any other country. Now that the 1s. 6d. Rupee has obtained a fresh lease of life, we should consider these matters seriously. For who knows how soon England will find it profitable to change the value of the Rupee?

A. C.

British Trade in Arms and Ammunition

Mr. Ramsay MacDonald, the British Prime Minister, took exception in a speech of his in the House of Commons to a statement made by Mr. George Lansbury to the effect that England supplied about one-third of the total world export trade in arms. But the American *Foreign Policy Reports*, dated August 16, 1933, gives the following table compiled from the League of Nations Statistical Year-Book covering the trade of 59 countries and 49 colonies.

The distribution of world trade in arms among these countries is shown in the following table:

	Per cent of total exports in 1930
Great Britain	30.8
France	12.9
United States	11.7
Czechoslovakia	9.6
Sweden	7.8
Italy	6.8
The Netherlands	5.4
Belgium	4.4
Denmark	1.9
Japan	1.9

It will be noted that 55 per cent of the total world exports in 1930 came from three countries—Great Britain, France and the United States. The private arms industries of these three countries, moreover, have been the source of approximately 75 per cent—more than $459,000,000—of all the war materials exported since 1920.

President Roosevelt Wants Criticism of His Programme

President Roosevelt *perhaps* possesses as much power and intelligence as our Anglo-Indian (old style) bureaucrats. But he does not consider himself or his government infallible. His national industrial recovery programme having been enthusiastically welcomed in his country he, addressing some journalists who visited White House, said that "he was dumb-founded by the almost unanimous support given to his programme

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

by the American press." He went on to ask :

> Where is your criticism ? You know the Government can make mistakes, and this programme is too vast an undertaking for any one man or set of men to be sure of. We are certain to make blunders. I rely on you newspaper men to check us. If you see us going wrong, for goodness sake, sing out about it. There is no kindness in flattering a wrong cause. I want your criticism as well as your support. It is the best kind ef backing, and the only request I make is that you be prompt about it.

Reviews and Notices of Vernacular Books

We are glad to be able to state that, with the help of our friends, we have resumed the publication of reviews and notices of books in the principal vernaculars of India with effect from the present issue. Authors and publishers will kindly bear in mind that we do not notice periodicals, pamphlets, booklets, reprints of magazine articles, school-books, and the like, nor can we guarantee that every book sent to us will be reviewed.

The Muhammadan Uprising in Chinese Turkistan

Indian readers of newspapers have not forgotten the news relating to the Muhammadan rebellion in Chinese Turkistan which appeared sometime ago in the dailies sporadically. It was felt that China was being weakened on the one hand by Japan and on the other by this uprising. And Hindu India was much agitated by the news of the rebels' attack on Hindu merchants. According to a paragraph in an article in the last October number of *Current History* of America there has been 'peaceful' penetration in China on the part of France, too. Mr. Wilbar Burton, the author of the article, writes :

> Yunnan, according to authoritative sources, has become virtually a part of French Indo-China. The British-trained army of Tibet has been encroaching on Szechuan for the past eighteen months. A recent Mahomedan uprising in Sinkiang (Chinese Turkistan) which, according to Chinese and Soviet accounts, was financed and directed by the British, has set up an allegedly autonomous government there with the apparent resulting loss of the territory to China."

It is the duty of the British Government to contradict the statement contained in the last few lines quoted above.

Reciprocity and Retaliation

According to Sir Samuel Hoare's memorandum no British subject, whether British by birth or otherwise, should be disabled from holding offices or practising any trade, profession or calling in British India only by reason of his religion, descent, caste, colour or place of birth, and that this principle would be applicable in the case of all British subjects including those of the British Dominions. Indian settlers in South Africa are practically treated as pariahs, do not enjoy the same civic status as the Whites and are subjected to many galling restrictions and disabilities. But India must not discriminate against the South African Whites in the same way, because Queen Victoria's Proclamation gave British subjects equal rights ! But this Proclamation gave assurances to Indians in India, not to South African Whites in South Africa. In fact, most Whites in South Africa had not become British subject in 1858, when the Proclamation was issued. Many solemn pledges *given to Indians,* including those contained in the Proclamation, are treated as mere scraps of paper, or, at the best, as "declarations of intention ;" but an assurance wrongly assumed to have been given to South African Whites, for example, when they have not become British subjects, must be respected. Of course, this is very unjust and galling to the self-respect of Indians. But who cares for the self-respect of people who are not free, or, rather, who is bound to assume that such people have any self-respect ?

Another matter in which India may be deprived of the right to insist on reciprocity relates to British medical men practising in India and Indian medical men practising in Great Britain. When the Legislative Assembly voted for the passage of the India Medical Council Bill, in the form in which it came out of the hands of the Select Committee, it was on the understanding that the provisions of the Bill relating to the right of retaliation

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

and other important rights would not be tampered with by the Joint Parliamentary Select Committee or other authorities who would draft the Indian Constitution Bill. But from an answer given by Mr. Bajpai to a question in the Assembly it appears that the Joint Select Committee would be free to do what they thought proper !

Indianization in the Army

So *Indianization in the Indian Army* is only an experiment ! There is much grim, though unintended, humour in the letters i n d i a n in the expressions Indianization and Indian army.

Sir Philip Chetwode, addressing the Indian Military Academy cadets, has said :

> We have had only a year in which to judge your progress, but from what I hear and what I see I feel confident that I may tell His Excellency the Viceroy and his Government that the experiment is justifying itself.

Experiment indeed ! As if in the long history of India, there were never any Indian military leaders of consummate ability !

"British Troops the Cement of India"

Recently Major-General Sir Alfred Knox delivered a lecture on "British troops the Cement of India" at a gathering of Conservatives at Manchester. Said he ;

> If you take that cement away, then India will dissolve into warring atoms.

During India's long past history, there have not been more internecine warfare than such warfare during the same period in Europe, which, *minus* Russia, is equal to India. But, though there are no foreign armies of occupation in European countries, they have not dissolved into warring atoms in modern times. There is, therefore, no reason *why in modern times* India should dissolve into warring atoms in the absence of a foreign army of occupation. Besides, when during the last great war there were only 15,000 white soldiers in India, the country neither dissolved into warring atoms nor showed a tendency to do so.

The Late Mr. Vithalbhai Patel's Bequest

It was quite characteristic of the late Mr. Vithalbhai Patel that he should have left more than a lakh of rupees for political work for India, particularly with reference to publicity work intended to place India's case before the civilized world outside India.

Kausambi

It is a welcome piece of news that Mr. Brijnarain Vyas, the cultured, energetic and public-spirited Executive Officer of the Allahabad Municipality has moved the Archæological Department to excavate the ruins of Kausambi, which was in Buddhist times a great capital city.

Allahabad

The Statesman has published the open secret that the piecemeal removal of the capital of the U. P. from Allahabad is intended as a punishment for the political sins of that city.

The Award of the Capitation Charges Tribunal

Though the Capitation Charges Tribunal derives its name from only one of the questions referred to it, its decision covers the whole field of the financial relations between the India Government and the War Office, London. The terms of reference of this Tribunal covered four main points :

> (*a*) Whether, and if so, on what basis, capitation payments should continue, namely, the contribution paid from Indian revenues towards the expenses borne by the War Office and the Air Ministry in recruiting officers, soldiers and airmen in England and training them for service in India ;
>
> (*b*) India's claim that a contribution should be made from Imperial revenues towards military expenditure from Indian revenues ;
>
> (*c*) The claim of the War Office and the Air Ministry that India should pay a direct contribution towards the cost of the Imperial reserves ; and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

(*d*) Whether the sea transport contribution paid by the War Office to India should be continued.

On these heads of military expenditure in dispute between the Government of India and the War Office, the decisions of the Tribunal as accepted by the respective Governments are as follows:

(*a*) The capitation charges in respect of the Army is reduced by £200,000 and the same charges are increased by £93,000 in respect of the Air forces, the net reduction in favour of India being thus £107,000 per annum.
(*b*) The Imperial contribution to Indian defence expenditure is fixed at £1,500,000. This sum would, however, include £130,000 representing the sea transport costs. The net gain in favour of India in respect of defence expenditure will thus be £1,370,000 a year.
(*c*) India will not have to pay any contribution towards the maintenance of Imperial reserves.
(*d*) The War Office will have to pay the sea transport cost, but the contribution will be included in the general contribution of the British Government towards Indian defence expenditure.

It will thus be seen that financially, the India Government has gained more or less on all the points, and the total gain in India's favour has been calculated to be £1,417,000 per annum, the Imperial contribution to Indian defence alone relieving the Indian tax-payer of the cost of about ten British battalions. This will no doubt mean some relief to the Finance Department, but whether the Indian tax-payer will also be benefited depends upon the use that will be made of the saving effected. Will there be a reduction of appromixately two crores in taxation? Will the sum be utilized for fostering education and the industries of the country? Or will the sum be appropriated to the salaries of the Police and the Civil Service?

Descending now from the general to the particular, one finds that the decisions of the Capitation Tribunal and of His Majesty's Government raise important questions of principle. Of these we shall take up only the question of the so-called capitation charges here. For more than a hundred years India has been paying the War Office a regular annual contribution for raising and training in England the British soldiers and officers required in India. The argument is that since India is incapable of defending herself and since Great Britain has to supply her with a contingent of British troops for that purpose India should not only pay for the British troops while they are stationed in India, but also contribute towards the expense of recruiting and training these soldiers in England. Before the war and for some years after it this contribution was paid at an annual *per capita* rate. But in 1926 a provisional settlement was arrived at by which the contribution was fixed at a lump sum of £1,400,000 for the army alone. The fairness of the amount was, however, contested by the India Government, and as a result a tribunal was appointed last year to arbitrate between the War Office and the India Government.

Now, Indian opinion has always objected to this contribution as unfair and burdensome, and its stand on this question has always been clear and consistent. In contradistinction to the Government of India, it has opposed not only the rate of the charge but the charge itself. It has rightly taken up the stand that since the British garrison in India is needed to uphold British Imperial interests, the talk of any service being rendered to India is more or less disingenuous. The question at issue then is the principle of the capitation charges and not simply their rate. This point should be stressed as seriously as possible, because there is just a chance that the immediate gain of something like two crores of rupees would make us overlook the implications of the position into which we are being led.

It cannot be doubted that by making a concession in the rate the British Government aims to place the capitation charges on a firm juridical basis. As the Prime Minister said in announcing the Government's decision in the House of Commons: "This involves the acceptance by the Government of India of capitation charges calculated in accordance with the Tribunal's suggestion as legitimate charges on Indian revenues." If this be a correct estimate of the position with regard to the capitation charges, then one should say that India has yielded on a fundamental principle in return for a negligible gain in pounds, shillings and pence.

The Reichstag Fire : An Example of Nazi Methods

The belated trial in connexion with the Reichstag fire has just concluded. At the time of writing these lines the text of the judgment is not available in this country. But whatever the contents of that document, it must be admitted fairly generally, that the German Supreme Court has to some extent maintained its reputation by acquitting Herr Torgler, formerly leader of the Communists in the Reichstag, and the Bulgarian Communists, Dimitroff, Popoff and Taneff. We say 'to some extent' only, because if the Court possessed the necessary courage and impartiality, it would not have condemned the half-witted twenty-four-year-old Dutch workman Marinus Van der Lubbe (who, of course, admitted the crime) without demanding that before it did so the other accused (*e. g.*, Goering and his Nazi associates) responsible for the fire be brought before it to stand their trial. But the Court, after all, derives its authority from the Nazi State ; and, naturally, it could not go so far without making itself liable for a 'term' in a concentration camp. Perhaps that is why though the Court sentenced to death the Dutch tramp for high treason in conjunction with, an act of insurrectionary incendiarism and acquitted his alleged accomplices in the crime, it has not passed an opinion as to who the other culprits may have been in view of the decisive facts (i) that Van der Lubbe was closely in touch with the Nazis for some time before the fire and actually spent the whole of 27th February in the company of some Nazis, and (ii) that the fire could not have been brought about by one man.

Van der Lubbe, if at all guilty (his conduct during the trial was suspicious), was no more than an instrument of the Nazi party, whose ends the fire most admirably served. The acquittal of Torgler, Dimitroff, Popoff, and Taneff takes the bottom out of the Nazi case, whatever the story of the planned Communist insurrection was worth (as, indeed, informed opinion was from the very first inclined to discount it). The Court has only repeated the verdict passed by the International Legal Commission of Inquiry which published its findings even before the official trial began at Leipzig. The coincidence of the International Commission's and the Supreme Court's opinions lends additional interest to what the former had to say, and to all that which supports the Commission's views on the political aspect of the whole affair. The Nazi Government described the International Commission as a body deliberately set up to discredit the Nazis in the eyes of the world. But now that its own court has pronounced opinion not very dissimilar to that of the Commission's as regards the guilt of all the accused except Van der Lubbe it would be interesting to hear what the Nazis have to say in their own defence. The Leipzig judgment makes it imperative that the search for real culprits be made in other directions than the one indicated by the prosecuting indictment of the prisoners. In fact, very material facts came to light even before the commencement of the trial : the trial was merely an eye-wash but as to how far it has succeeded in bluffing political opinion all over the world we entertain grave doubts.

The Reichstag fire was too sensational an episode to be soon forgotten, and the public of all countries will doubtless form some opinion of it, if it has not yet. That being so, it is much to be desired that such an opinion should be framed in the light of certain facts which might be given too little consideration.

In the short space possible to devote here it would be best to state some bare facts only. These are : (i) Such an act of incendiarism on the part of the Communist party would surely have been suicidal to their prospects in the elections of March 5 which were close at hand, as, indeed, a vast section of the electorate succumbed to the Communist scare got up by the Nazis. (ii) Herr Torgler himself predicted such an incident during the fifth session of the Prussian State Council on Feb. 23, 1933. The Communists were warned by the Reichswehr previously that some big "provocation" was planned. And because Torgler was so straightforward as to give out his knowledge before the Prussian State Council on Feb. 23, that day's proceedings were withheld from members. (iii) Though the Government declared that they had discovered plans

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

for a Communist uprising on the night of Feb. 27-28 the Reichstag building was left sparsely guarded. (iv) The fire was very extensively organized—it was set on from various points with a great deal of fire-raising material. In fact the fire-brigade chief, who got the fire under, testified that "in parts of the Reichstag building which were not destroyed there were great masses of unused incendiary material lying about . . . material which would have completely filled a lorry." Many men, therefore, must have been employed. How did they get in ? And how did they get out ? And how was the incendiary material introduced ?

The building stands on a detached area. It is strongly watched on every side day and night. No one but a member is admitted and that through an elaborate system of permits and shepherding. How could an incendiary gang get in with over a lorry-load of material in the short space of one-and-half hours which elapsed between the closing of the building and the discovery of the fire ? There was one easy way, and no other thinkable one. The building is connected by a subterranean passage with the house of the Reichstag President, who is none else than Goering himself. Obviously, then, this is the only feasible clandestine approach that an early official statement suggested that the Communists "may have been able to escape through." But seeing that it only led to a hostile fortress garrisoned by 30 storm-troopers, this absurd suggestion was dropped. Thus the people who profitted most by the act were also the people who had any power to do it in the way it was done.

There are numerous other considerations, for example, the Oberfohren Memorandum that originated inside the Cabinet itself, but it is not possible to touch upon them here for want of space. But one consideration is important: is it really possible that Goering and Van der Lubbe had part in the fire ? What sort of character do these men possess ? Eight years ago (we are informed in *The Brown Book of the Hitler Terror*) Goering was confined in a lunatic asylum in Sweden, and six months later he was certified by a doctor to be a morphia addict. Facsimiles of documents are given to prove both facts. As for Van der Lubbe there is no evidence that he had any connexion with any Communist movement after 1931 when he left the Dutch Communist party of which he had been a member for some time. There is evidence according to the Commission that he developed hostility to "all forms of working-class organizations," and that he even supported Facist doctrines. From 1927 to 1933 he lived "in a milieu of more or less anarchistic elements and of homo-sexuals."

The Reichstag fire will in any case go down to history as the one single event that more than any other put the Hitlerites in power.

The Eighth Session of the All-India Women's Conference

The All-India Women's Conference which is a standing organization working throughout the year for the social, political, educational and economic uplift of the women of India is holding a very successful eighth session at Calcutta. Lady Abdul Qadir of Lahore presided over the Conference and read a very able address, which, however, we are debarred from commenting on, as we are going to press earlier than usual.

THE MODERN REVIEW

FEBRUARY 1934

VOL. LV., No. 2 WHOLE No. 326

THE LAST LETTER

By JAWAHARLAL NEHRU

Being the last of a series of historical letters written in gaol to his daughter Indira by Jawaharlal Nehru.

[Jawaharlal Nehru wrote a series of elementary letters to his daughter six years ago. These were published in book form. During his stay in prison in 1931, 1932 and 1933 he continued this series, which was in the form of glimpses of world history. He completed the series, bringing it up to date, in August 1933, a little before his discharge from prison. We understand that arrangements are being made for the publication of the full series in English, Hindi, Urdu, and Gujarati. We give below the last letter of the series.—ED., *M. R.*]

WE have finished, my dear; the long story has ended. I need write no more, but the desire to end off with a kind of flourish induces me to write another letter—the Last Letter!

It was time I finished, for the end of my two year term draws near. In three and thirty days from today I should be discharged, if indeed I am not released sooner, as the jailor sometimes threatens to do. The full two years are not over yet, but I have received three and a half months' remission of my sentence, as all well-behaved prisoners do. For I am supposed to be a well-behaved prisoner, a reputation which I have certainly done nothing to deserve. So ends my sixth sentence and I shall go out again into the wide world, but to what purpose? *A quoi bon?* When most of my friends and comrades lie in jail and the whole country seems a vast prison.

What a mountain of letters I have written! And what a lot of good *swadeshi* ink I have spread out on *swadeshi* paper. Was it worthwhile, I wonder? Will all this paper and ink convey any message to you that will interest you? You will say, 'Yes, of course,' for you will feel that any other answer might hurt me, and you are too partial to me to take such a risk. But whether you care for them or not, you cannot grudge me the joy of having written them, day after day, during these two long years. It was winter when I came. Winter gave place to our brief spring, slain all too soon by the summer heat; and then when the ground was parched and dry and men and beasts panted for breath, came the monsoon with its bountiful supply of fresh and cool rain water. Autumn followed, and the sky was wonderfully clear and blue and the afternoons were pleasant. The year's cycle was over, and again it began: winter and spring and summer and the rainy season. I have sat here, writing to you and thinking of you, and watched the seasons go by, and listened to the pitapat of the rain on my barrack roof—

"O doux bruit de la pluie,
Par terre et sur les toits!
Pour un coeur qui s'ennuie,
Oh! le chant de la pluie!"

"O the sweet sound of the rain,
On the ground and on the roofs!
For a heart that is aweary,
Oh! the song of the rain."

Benjamin Disraeli, the great English statesman of the nineteenth century, has written that

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

"Other men condemned to exile and captivity, if they survive, despair; the man of letters may reckon those days as the sweetest of his life." He was writing about Hugo Grotius, a famous Dutch jurist and philosopher of the seventeenth century, who was condemned to imprisonment for life but managed to escape after two years. He spent these two years in prison in philosophic and literary work. There have been many famous literary gaol-birds, the two best known perhaps being the Spaniard, Cervantes, who wrote *Don Quixote*, and the Englishman, John Bunyan, the author of *The Pilgrim's Progress*.

I am not a man of letters and I am not prepared to say that the many years I have spent in jail have been the sweetest in my life, but I must say that reading and writing have helped me wonderfully to get through them. I am not a literary man, and I am not a historian; what indeed am I? I find it difficult to answer that question. I have been a dabbler in many things; I began with science at college and then took to the law and, after developing various other interests in life, finally adopted the popular and widely-practised profession of jail-going in India!

You must not take what I have written in these letters as the final authority on any subject. A politician wants to have a say on every subject, and he always pretends to know much more than he actually does. He has to be watched carefully! These letters of mine are but superficial sketches joined together by a thin thread. I have rambled on, skipping centuries and many important happenings, and then pitching my tent for quite a long time on some event which interested me. As you will notice, my likes and dislikes are pretty obvious, and so also sometimes are my moods in jail. I do not want you to take all this for granted; there may indeed be many errors in my accounts. A prison, with no libraries or reference books at hand, is not the most suitable place to write on historical subjects. I have had to rely very largely on the many note books which I have accumulated since I began my visits to jail twelve years ago. Many books have also come to me here; they have come and gone, for I could not collect a library here. I have shamelessly taken from these books facts and ideas; there is nothing original in what I have written. Perhaps occasionally you may find my letters difficult to follow; skip those parts, do not mind them. The grown-up in me got the better of me sometimes and I wrote as I should not have done.

I have given you the barest outline; this is not history; they are just fleeting glimpses of our long past. If history interests you if you feel some of the fascination of history you will find your way to many books, which will help you to unravel the threads of past ages. But reading books alone will not help. If you would know the past, you must look upon it with sympathy and with understanding. To understand a person who lived long ago, you will have to understand his environment, the conditions under which he lived, the ideas that filled his mind. It is absurd for us to judge of past people as if they lived now and thought as we do. There is no one to defend slavery today, and yet the great Plato held that slavery was essential. Within recent times scores of thousands of lives were given in an effort to retain slavery in the United States. We cannot judge the past from the standards of the present. Every one will willingly admit this. But everyone will not admit the equally absurd habit of judging the present by the standards of the past. The various religions have especially helped in petrifying old beliefs and faiths and customs which may have had some use in the age and country of their birth, but which are singularly unsuitable in our present age.

If, then, you look upon past history with the eye of sympathy, the dry bones will rise up with flesh and blood, and you will see a mighty procession of living men and women and children in every age and every clime, different from us and yet very like us, with much the same human virtues and human failings. History is not a magic show, but there is plenty of magic in it for those who have eyes to see.

Innumerable pictures from the gallery of history crowd our minds: Egypt—Babylon—Nineveh—the old Indian civilizations—the coming of the Aryans to India and their spreading out over Europe and Asia—the wonderful record of Chinese culture—Knossos and Greece

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

—Imperial Rome and Byzantium—the triumphant march of the Arabs across two continents—the renaissance of Indian culture and its decay—the little known Maya and Aztec civilizations of America—the vast conquests of the Mongols—the Middle Ages in Europe with their wonderful Gothic cathedrals—the coming of Islam to India and the Mughal Empire—the Renaissance of learning and art in Western Europe—the discovery of America and the sea-routes to the East—the beginnings of Western aggression in the East—the coming of the big machine and the development of capitalism—the spread of industrialism and European domination and imperialism—and the wonders of science in the modern world.

Great empires have risen and fallen and been forgotten by man for thousands of years, till their remains were dug up again by patient explorers from under the sands that covered them. And yet many an idea, many a fancy has survived and proved stronger and more peristent than the empire.

"Egypt's might is tumbled down
Down a-down the deeps of thought ;
Greece is fallen and Troy town,
Glorious Rome hath lost her crown,
Venice' pride is nought.

But the dreams their children dreamed
Fleeting, unsubstantial, vain,
Shadowy as the shadows seemed,
Airy nothings, as they deemed,
These remain."

So sings Mary Coleridge.

The past brings us many gifts ; indeed all that we have today of culture, civilization, science or knowledge of some aspects of the truth, is a gift of the distant or recent past to us. It is right that we acknowledge our obligation to the past. But the past does not exhaust our duty or obligation. We owe a duty to the future also and perhaps that obligation is even greater than the one we owe to the past. For the past is past and done with, we cannot change it ; the future is yet to come and perhaps we may be able to shape it a little. If the past has given us some part of the truth, the future also hides many aspects of the truth and invites us to search for it. But often the past is jealous of the future and holds us in a terrible grip, and we have to struggle with it to get free to face and advance towards the future.

History, it is said, has many lessons to teach us ; and there is another saying that history never repeats itself. Both are true, for we cannot learn anything from it by slavishly trying to copy it, or by expecting it to repeat itself or remain stagnant ; but we can learn something from it by prying behind it and trying to discover the forces that move it. Even so what we get is seldom a straight answer. "History," says Karl Marx, "has no other way of answering old questions than by putting new ones."

The old days were days of faith, blind, unquestioning faith. The wonderful temples and mosques and cathedrals of past centuries could never have been built but for the over-powering faith of the architects and builders and people generally. The very stones they reverently put one on top of the other, or carved in beautiful designs, tell us of this faith. The old temple spire, the mosque with its slender minarets, the Gothic cathedral—all of them pointing upward with an amazing intensity of devotion as if, offering a prayer in stone or marble to the sky above—thrill us even now, though we may be lacking in that faith of old of which they are the embodiments. But the days of that faith are gone, and gone with them is that magic touch in stone. Thousands of temples and mosques and cathedrals continue to be built but they lack the spirit that made them live during the Middle Ages. There is little difference between them and the commercial offices which are so representative of our age.

Our age is a different one ; it is an age of disillusion, of doubt and uncertainty and questioning. We can no longer accept many of the ancient beliefs and customs ; we have no more faith in them, in Asia or in Europe or America. So we search for new ways, new aspects of the truth more in harmony with our environment. And we question each other and debate and quarrel and evolve any number of 'isms' and philosophies. As in the days of Socrates, we live in an age of questioning, but that questioning is not confined to a city like Athens ; it is world-wide.

Sometimes the injustice, the unhappiness, the brutality of the world oppresses us and darkens our minds, and we see no way out. With Matthew Arnold, we feel that there is

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

no hope in this world and all we can do is to be true to one another.

"For the world which seems
To lie before us, like a land of dreams,
So various, so beautiful, so new,
Hath really neither joy, nor love, nor light,
Nor certitude, nor peace, nor help for pain ;
And we are here, as on a darkling plain
Swept with confused alarms of struggle and flight,
Where ignorant armies clash by night."

And yet if we take such a dismal view, we have not learnt aright the lesson of life or of history. For history teaches us of growth and progress and of the possibility of an infinite advance for man. And life is rich and varied, and though it has many swamps and marshes and muddy places, it has also the great sea, and the mountains, and snow, and glaciers, and wonderful star-lit nights (especially in jail !), and the love of family and friends, and the comradeship of workers in a common cause, and music, and books and the empire of ideas. So that each one of us may well say :

"Lord, though I lived on earth, the child of earth,
Yet was I fathered by the starry sky."

It is easy to admire the beauties of the universe and to live in a world of thought and imagination. But to try to escape in this way from the unhappiness of others, caring little what happens to them, is no sign of courage or fellow-feeling. Thought, in order to justify itself, must lead to action. "Action is the end of thought," says our friend Romain Rolland. "All thought which does not look towards action is an abortion and a treachery. If then we are the servants of thought, we must be the servants of action."

People avoid action often because they are afraid of the consequences, for action means risk and danger. Danger seems terrible from a distance ; it is not so bad if you have a close look at it. And often it is a pleasant companion, adding to the zest and delight of life. The ordinary course of life becomes dull at times and we take too many things for granted and have no joy in them. And yet how we appreciate these common things of life when we have lived without them for a while ! Many people go up high mountains and risk life and limb for the joy of the climb and the exhilaration that comes from a difficulty surmounted, a danger overcome ; and because of the danger that hovers all around them, their perceptions get keener, their joy of the life which hangs by a thread the more intense.

All of us have their choice of living in the valleys below with their unhealthy mists and fogs but giving a measure of bodily security ; or of climbing the high mountains with risk and danger for companions, to breathe the pure air above, and take joy in the distant views, and welcome the rising sun.

I have given you many quotations and extracts from poets and others in this letter. I shall finish up with one more. It is from the *Gitanjali* ; it is a poem, or prayer, by Rabindranath Tagore :

"Where the mind is without fear and the head
is held high ;
Where knowledge is free ;
Where the world has not been broken up into
fragments by narrow domestic walls ;
Where words come out from the depth of truth ;
Where tireless striving stretches its arms towards
perfection ;
Where the clear stream of reason has not lost its
way into the dreary desert sand of dead
habit ;
Where the mind is led forward by thee into
ever-widening thought and action—
Into that heaven of freedom, my Father, let my
country awake.

We have finished, carissima, and this last letter ends. The last letter ! Certainly not. I shall write you many more. But this series ends, and so

Tamam Shud !

OUR PROTECTION POLICY

By NILAKANTHA DAS

THE Indian Tariff Board is sitting on enquiring to recommend, if necessary, an extension of protection to the Indian Steel Industry, that is, mainly, if not entirely, to the Tata Iron and Steel Company at Jamshedpur. About ten years India has been passing through a period of giving protection to industries, and for over three years industrial countries like England have been, so to say, mad after protecting their own industries. Depression in trade leads to protection and protection ends in further depression. Thus the world's commerce is moving in a vicious circle. India that has no voice to be called her own finds herself in the midst not only of a vicious circle but of a dangerous whirlpool. Many a tariff board has come and gone. Practically they have taken evidence from capitalists interested in industries and other similar interested parties. The consumer and the tax-payer who bear the burden of protection, are hardly taken into any serious account, though every thing is formally done in their name. The reason is that the mass of the population are not alive to the effects of measures like protection. Nor are they made to feel the effects, as all protection is given by tariffs on imported articles—*i.e.* by indirect taxes.

A nation gives protection to its own industries when any industry cannot compete with foreign imported products in price, but is expected to compete in course of time as a result of the protection. This protection is of two forms—one is Bounty, and the other is Duty.

(1) *Bounty*—In a system of Bounty Government directly gives money to the industry to make up its difference in price with the same kind of imported articles. For instance, say, if the fair selling price of galvanized sheets made by the Tata Company is found to be not less than Rs. 236 per ton and the imported article sells at Rs. 153 per ton, then the Government may give a direct help of Rs. 83 per ton to the Tata Company to enable it to sell its galvanized sheets in competition with imported articles. This is called Bounty and it is met from the Government revenues, that is, by the general tax-payer of the country.

(2) *Duty*—Similar help can also be given by taxing the imported articles. This tax is called Duty. In the above instance the Government instead may levy a duty of Rs. 83 per ton on imported galvanized sheets, which they are actually doing today. Tariff is a list of these Statutory duties and we therefore generally say protection by tariffs, that is, duties on several imported articles.

In all protection the nation pays on the calculated assurance that the industry protected will in course of time stand on its own legs, *i.e.*, face competition without protection. Protection which does not end in gradual progress and expansion of the industry is useless and is a waste of national wealth. Hence in a system of protection a careful application of the money with a watchful vigilance to ensure growth of national wealth and economy is essential.

Bounty is a definite grant. Its administration may be a little more difficult, but it makes the giver always watchful and the receiver careful. It is based on direct tax—which is the main stay of progressive taxation. Direct tax may be unpalatable, but it is always directed to classes of people who can pay, and its progressive character readily contributes to an increase of national wealth. It affects neither the consumer nor the poorer class of the tax-payer. But as Governments generally have to deal with the organized opposition of richer classes in the country, the unintelligent and unorganized mass of the population, *i.e.*, the poorer tax-payer and the general consumer are more easily made to bear the main burden of the State, without knowing that they bear it. Hence Governments generally shrink from levying direct taxes, and this is very often responsible for

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

preferring tariffs to bounties in the matter of protection.

Duty is always an indirect taxation. We are paying indirect taxes on many of our articles of use, such as, cloth, matches, kerosene, salt, etc, etc. This indirect tax not only makes prices of imported articles higher, for these imported articles pay the tax directly to the Government; but all prices adapt themselves up to the price of those imported articles and the living becomes dearer in consequence. In the above instance suppose for some reason the fair selling price of the Tatas' Galvanized Sheets could be reduced, but so long as the duty remains unreduced Tatas will never think of reducing their prices. Thus, this indefinite protection by tariff, given by an indirect unconscious payment by the people, affords a bad sense of security to the industry protected, which consequently becomes careless about the money it receives. Hence a system of indirect taxation is always regressive in its effect and is bad for national economy. To a certain extent it can only be adopted in countries where the standard of living is so high that a little indirect increase on account of taxation will not palpably affect the economic condition of the people.

Protection by tariff, moreover, is fatal to national economy where the normal production, in the country, of the particular articles protected is a small part, say less than half, of the normal consumption of the same article in the country. For instance, Tatas' maximum production of steel is calculated under best of conditions to be six hundred thousand tons. The normal Indian consumption of steel is twelve hundred thousand to fifteen hundred thousand tons. So with all the necessary protection the country never expects to supply half the market in steel. But the consumer under the tariff system is being made to pay to the Government on more than half the articles consumed. Another glaring instance is that of the galvanized sheets to protect which the consumer pays more than Rs. 83 per ton. This protection began when Tatas could supply only 12 % of the Indian consumption. Inspite of all this artificial prop the present supply of the Tatas has not gone beyond 32% (last year's account).

Thus considering the general principles of protection the present Indian tariff system is not *prima facie* suitable to the present industrial and economic circumstances prevailing in India. Well-considered bounty should have been the only course followed; for bounty is definite both in the amount of money spent as well as the effect produced. In a system of bounty there can be no waste of tax-payers' money, and today the ordinary tax-payer and the consumer has no extra pie to spare for the luxury of protection.

Now let us consider the particular conditions prevailing in India in relation to the world's trade, and their bearing on our policy of protection.

After the world war prospects of industries all over the world looked up. India's steel and iron wares were a great help to the British nation during the war. During this period as well as in the period of boom that followed Indian iron and steel brought money beyond all expectation. The reaction began in 1922. All over the country the capitalist industrialists raised a clamour for protection to our industries; for all other industries more or less had followed the same course as that of steel and iron.

In this cry for protection some salient points need be remembered. World's industry in different countries has developed different ideals and different methods of progress. During the course of the war Russia developed communism, *i. e.*, Russia wanted to nationalize all industries and developed methods of industrial progress in which the old world capitalist was of no use. The United States of America did not give up captialism but it sought to nationalize industry and to base it as far as possible on human expectations. It developed methods of giving higher pay for better profit in which the labourer became gradually conscious that he had a definite share. The barrier of aristocracy between capital and labour began gradually to break down. Recently Japan has attempted a new method, and perhaps successfully. This is an amalgam, so to say, or a synthesis of the Russian and the American methods. There are capitalists who finance industries and at

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the same time all industry is the property of the nation as it were. The profit as well as the labour is the concern of the State. All these three countries, particularly Russia, are vast agricultural countries and conditions prevailing there approach those in India except that in India the people have practically nothing to do with the policy of the State.

In industrial countries like England where the system is very old the methods are so to say antiquated. Capital and Labour stand apart and an age-long aristocratic mentality stands practically like a stone wall between them. The idea underlying this method is that Labour must be fleeced so that capital may flourish and the strength of money is considered the real strength of the State. India in her industrial outlook is a creature of England. For various reasons, which may or may not bear mention here, she has got to follow in the footsteps of England, and even in matters of detail where freedom could, to a certain extent, be exercised she does not think or act freely. So whatever is done in England or say dominions like Canada, must be followed in India. In our policy of protection this mentality, it will be explained, has already been responsible for a good deal of mischief, and the interests of the nation will suffer if we do not think and act freely in our industrial policy even now.

Without giving any detailed explanation in this connection it may be mentioned that on the 16th February, 1923, when the policy of protection first came up for discussion in the Legislative Assembly, Mr. C. A. Innes (now Sir Charles Innes), the then Commerce Member, said as follows on behalf of the Government of India :

> "Our policy of protection must increase the level of price for the consumer generally and particularly for the agricultural and middle classes. There is no getting away from this fact. By discrimination we may mitigate the rise. But the fact remains, and it is so certain that I do not propose to argue it, that a policy of protection must mean an increase of prices in India. Now, I am well aware that many countries have gone in boldly for a policy of protection in spite of this disadvantage. But we are considering the case of India. We are not considering the case of countries with a high standard of living like the United States of America and like dominions such as Canada and Australia. People of countries like that can no doubt pay the inevitable price that protection demands. But in India we have a country of 300 millions. Two thirds of that population are agriculturists. Most of them are poor, and the standard of comfort is low. One thing I think is certain. If the agricultural classes were able fully to bring their influence to bear upon this Assembly, I doubt very much whether this Assembly today would accept my amendment. I doubt indeed whether I should be putting that amendment (*i.e.*. in favour of discrimnating protection) forward. The agricultural classes in every country in the world, I think, I may say this with confidence, stand to gain the least and lose the most by a policy of protection. But even if we leave the agricultural classes out of consideration, is there any one in this house who can view without alarm, having regard to the conditions of India, the prospect of a substantial rise of prices following upon the development of a policy of protection ? It is easy to say that India must be prepared for a sacrifice. But surely the experience of the last few years has demonstrated even to the most unobservant, the effect of high prices not only upon the public finances of India but also upon the political, social and economic conditions throughout the country."

The general consumer of industrial products—the general tax-payer as well as the poor agriculturalist, is practically one and the same man in India and according to the above sentiments expressed by the Government, a policy of protection and that by tariffs, cannot be conducive to the interest of the Indian masses. It may, however, be asked, why the Government after expressing these sentiments consented to a policy of protection. The Government amendment on the same occasion, *i.e.*, on the 16th February, 1923, included the following clause :

> (b) That in the application of the above principle of protection regard must be had to the financial needs of the country and to the present dependence of the Government of India on Import and Export and Excise duties for a large part of its revenues."

Thus it is clear that the Government has developed a vested interest in this policy of protection by tariff and an examination of the Indian Budget year after year will bear out how the customs revenue rose year after year on account of the protective tariff on industrial products. If the Government want money they may tax the people and take the consequences, if any. But to balance their budget they should not take shelter under a policy of protection and thus trade upon the patriotic sentiment of the people on the one hand, and the self-interest of the capitalist on the other.

The significance of the above clause in the Government amendment has been of late

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

sought to be explained away in some interested quarters by the assertion that high protective tariffs may at once reduce consumption of foreign articles very markedly and Government might lose much of its revenue realized from customs, which is the main stay of Government finances. This plausible explanation was neither meant nor is borne out by the policy since followed by the Government. Ordinarily high duties are responsible for lower consumption and a consequent reduction of revenue. But there is always a minimum normal consumption which cannot be much reduced in ordinary times. The present abnormal fall of revenue, if any, is due to circumstances affecting the quantity and price of world trade and not to purely local conditions.

Again, had that been the intention of the Government, *i.e.*, had the Government been afraid of high prices in the country apprehending an abnormal fall in customs revenue, Government might have taken to a consistent policy of protecting our industries by a system of giving bounties. Bounty would mean a direct taxation. But that taxation, as I have said, could be well directed to people who could pay taxes like super-tax on income, death duty etc. It would affect neither the general tax-payer nor the consumer of the industrial products who is ordinarily poor, or, the Government might contract a loan of a few crores for the purpose of protecting our industries. The tax-payer would pay the interest of this productive loan for a few years and then the industry would pay it. A furtherance of our industrial wealth by this means would ultimately be as much paying, if not more, as our railway debt. But these are means and methods which do not suit the fixed policy of parties interested in ruling over our destinies.

Thus the present policy of protection has a definite plan and a political motive behind it. The poor man, the consumer, is being bled white to fatten only a few industrial magnates in the land. But neither any industry as such is really promoted nor the mass of the nation is benefited in any other way. This *prima facie* may look absurd. Let us indicate the real reason behind this apparent absurdity. The dissatisfied masses of India cannot permanently be depended upon. Sooner or later they will become alive to their own interests, however much one may try to throw dust in their eyes. A foreign Government must in that case have to depend on some elements of the community of the governed. These elements must be made to remain under obligation to that Government. Zemindars of old were created and protected at a time with this object in view. But for many obvious reasons they may not be now considered an adequate safeguard. Hence another like element of the community is to be sought for, and this is found in the owners of industries. Various measures, again, are being devised to identify their interests with the interests of external capital working in this country. The recent White Paper proposes such an identity of interests in trade and industries; but the ordinary man in the street wonders as to what a proposal like this for equal opportunities of trade and industry does actually signify. The consumer may be alarmed to imagine the state of things—the effects of all his protection—under the Government proposed in the White Paper, when statutory elimination of commercial discrimination will have its full sway in this country. Big competitive English firms will rise up, and the perpetually protection-pampered firms like Tatas, for instance, will either count out their days in supplying cheap basic materials to those firms or will lose their own existence in the midst of those firms. This danger is enough to dispel the lethargic sense of security under a system of protection by tariffs supported by an interested Government and make our industries try at once to stand on their own legs to face all competition successfully.

In this connection the misgivings of the Indian consumer in another like direction must be seriously taken into account. The tariff policy of the Government of India is intimately connected with the policy of Imperial, or more correctly, British preference. Here it may be noted that our protection to industry began only in 1924 in connection with the steel industry, *i.e.*, the Tata Iron and Steel Company of Jamshedpur. The policy was inaugurated mainly in giving bounty to the Tatas on certain articles. The tariff was rather negligible. The same method was repeated in 1925. The Legislative Assembly was made

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

to sanction this policy which was to be in force for three years. But unfortunately for the Indian consumer and the mass this much-praised Bounty Policy was made a thin end of the wedge for a purely protective tariff policy for the future and the Legislative Assembly was sought to be lulled in the belief that it had been committed to a policy of protection to steel industry, no matter whether it was to be by bounty or by tariff. It may now be clear that this was a deliberate change, a measure adopted as one most suitable for Imperial or British preference. The same Sir Charles Innes, who was then the Member for Commerce and Railways, had to represent India in the Imperial Economic Conference of 1923 in London, where he said :

> "Large sums have been set aside for the rehabilitation of her (India's) Railways and I hope that we may be able to embark on some new construction. On Railway material alone we spent last year, almost entirely in this country, more than 8½ millions sterling. Other development schemes are in contemplation, and in one way or another the Government estimate that something like 70 millions sterling will be spent on imported stores during *the next five years* for the Railways and other development schemes. As in the past so in the future, I have no doubt that the skill and enterprise of the British manufacturers will see to it that the vast bulk of their (Indians') moneys will be spent in this country."

The next five years of the above statement was to end in 1928 and preference to British Steel was enacted in the Indian Legislature in 1927 along with tariff protection to Indian Steel industry. To make the above quotation intelligible it may be further explained here, that in the name of development in India, the Indian Government made a plan for huge Railway construction and they proposed to borrow 30 crores of rupees a year for five years mostly in England. Much of it was to go to purchase British Steel, though during these five years all the money could not be spent nor the purchased materials fully utilized for new Railway construction. This five year plan nevertheless was to end in 1928 and new ways for supplying market to British Steel were necessary.

But plausible arguments are not wanting in support of preference to British Industry. Treasury Benches in the Indian Legislature may still use them somewhat effectively in the House. But it may be well suggested, if preference is really necessary, the Indian tax-payer should be asked to take to other means, free and straightforward. He may be asked, for instance, to purchase definite quantities by convention. But a preference worked automatically under a system of protective tariff is not only bad economy, but it affects national morality.

Protective tariff under our Indian circumstances should be, therefore, by all means avoided. If it can be proved that protection to any industry is still a real necessity, bounty is the only course to follow. After all this, if a tariff policy is still contemplated, first of all preference should be scrupulously eliminated and secondly the money obtained by Government beyond revenue duty, should be earmarked and set apart for expansion and promotion of industry and other works of nation-building.

An interested Government combined with the interested capitalists ought not to lead the patriotic mass of the consuming public into a policy the disastrous effects of which the latter are never allowed either to comprehend fully or to counteract effectively.

RUSSIA TODAY

By NITYA NARAYAN BANERJEE

IT was 9 o'clock in the morning. For the fine arrangement of central steam heating I had a nice sound sleep. I remember a day in Hamburg, where I stayed in a hotel without central heating : although the whole body was in fur quilt the head with the brain inside seemed to be frozen, callous—the whole room seemed to be a cold storage and myself a cold piece of meat. In England too in most of the hotels and pensions one has to have the same experience, as the English people are too conservative to change their gas fire and their small buildings do not justify a central heating arrangement. But in this hotel the heating arrangement was splendid—there was hot and cold water running in the bath-room. The breakfast was not a palatable one ; only I could take the 'Chai' (Tea) and a piece of brown bread.

"Good morning, had a nice sleep ?" Said the smiling face of my guide in the dining room.

"Aren't you ready ? Oh, what a lazy fellow you are," added she.

Taking my last sip I said, "Yes I am ready—I was just waiting for you.".

"Come on ; we should not lose any time today."

"Excuse me, I am bringing my overcoat from my room, a minute please," begged I. The lift brought me up ; on the way to my room in the corridor I met some children. They were so nice and charming that I could not help stopping a moment near them. One of them—a girl aged about seven, asked in clear English, "Do you speak English ?" I was glad indeed to have a chance to talk with these pretty babies. I asked, "Are you Russian ? How do you speak such good English." The girl replied, "No, I am American. My father is an Engineer here."

"How long have you been here ?"

"About ten months, but you know we are not going to stay here longer. The Russians are very bad people."

I was eager to know why this little baby was so angry with the Russians. She added, "My father had two years' contract here, but they are treating us very badly. You know they are so naughty that so long they need our service they will worship us, but when they themselves understand the job they try to kick us out but as they made contract with us they can not do it straight, that is why they are treating us so badly." It was evident that the other two girls could not understand our talk. I asked them, "Can't speak English ?" They laughed and said something which I could not understand. The American girl said, "They can't speak English, they are Russian. But I can speak Russian, German and French too." To test her I asked in German, "How did you learn so many languages ?" She began to talk like a machine. "Oh, I had been in Germany for two years and in France a year. My father used to work there." I came to my senses ; I had been detaining the guide unnecessarily. They all bent their knees a little and nodded. The American girl enquired, "Will you please come to our music this evening ?" I promised to come if I could come back by that time.

The guide advised that it would be convenient to see round the city with a taxi as more things could be seen in a day. I agreed to the proposal. So we had to go to the Intourist Office to make arrangements for the taxi. The office was not very far and the temperature was not so terrible ; so we walked.

Not a single shop with the fine continental art of display came to my notice. Motor buses were very rare but the Russians hope to have plenty of them very soon, when their own motor factories will begin to produce them. Now as Russia has no credit in the world market she has to buy every thing by gold, by selling their food or timber. There are a few hackney carriages, mostly for carrying loads, some with pneumatic tyres. These are still private property. Now Russia has allowed private trade provided no one is

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

exploited by that. There are laws which prohibit employment of any person by any individual trader except on some special condition. Even the farmers are not allowed to hire labour except in illness or under some such conditions. The revolutionaries have changed their laws regarding private enterprise but not the aim. Now all sorts of private trade can be carried on in Russia by law. But for the heavy taxes, supertaxes and apathy of the State, it is practically impossible to carry on any business on a large scale. The potter may produce his goods and sell them in the open market—the weaver, carpenter, blacksmith or such other individual traders can carry on their trade individually and sell their goods publicly, provided they do not hire any labourers, that is, exploit others' labour, but all private traders are defranchised, taxed and that heavily and noticed with a suspicious look. To forfeit one's property is the most common punishment in Russian Court in case of a private trader. A private trader's son will have the last chance in school, hospital, club and army, his children will have to pay more for their education, food, clothing and lodging. From every side the State is eager to take as much as possible from a private trader, it is their main object to strike the death blow to individual trading, as that is their greatest enemy. There is no private shopkeeper in Leningrad, no private taxi, house, no immovable personal property: every thing is owned by the state. If any one incurs the wrath of the State he is sure to starve, as there is none to employ him; if he has money it will be soon exausted by the heavy prices of goods which a non-labourer must pay. If anyone does the work of a middleman, *i.e.*, buys goods from villages at cheaper rates and sells in towns at higher rates thereby having some profit for himself, he is prosecuted and sentenced heavily.

On the way I saw a boy begging on the foot-path. I jokingly asked the guide, "Well, is it a fact that you have no unemployment and no beggar ?"

"Yes it is so—have you any doubt about it ?"

Pointing to the boy I said, "He speaks against your statement."

"Ah, those are naughty boys. They are often taken to nurseries by the police—but they are habitual beggars, they fly away from the nursery and begin to beg. They are lazy by blood, they prefer begging to work. But fortunately they are very few," said she. I asked, "Surely these poor boys are not treated well there. Had they got better and loving treatment, why would they leave the nursery and beg in this cold ?"

"You see, by blood they are so idle that they don't like the discipline and work of the nurseries. You understand ?"

A Picture in Hermitage. Leningrad

"Yes, but why are your people so poor in general. Everyone is insufficiently clothed and probably not well fed. What have you gained by the revolution, by so much bloodshed ?" asked I.

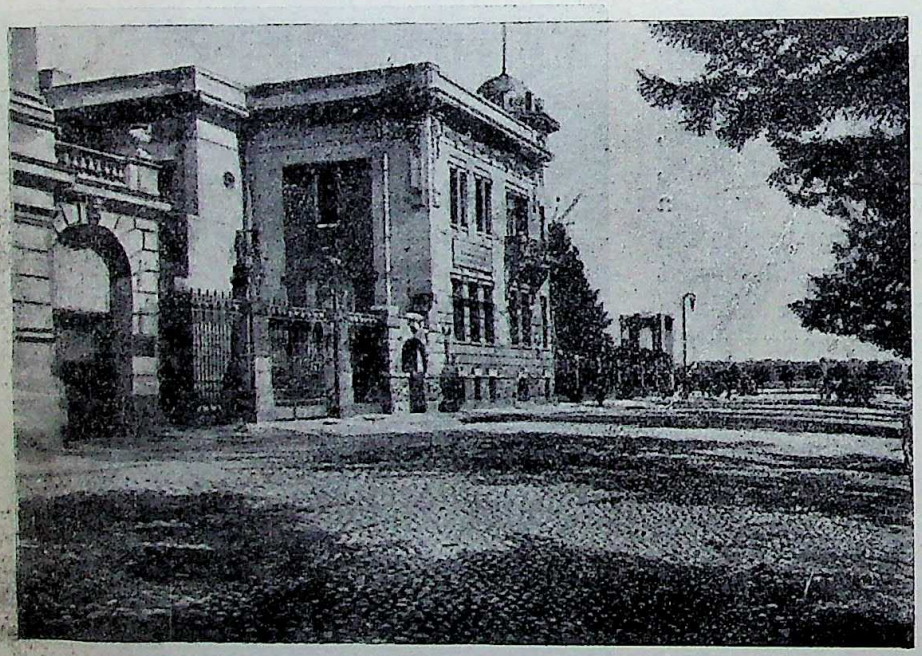
She replied, "True it is that we have not got enough clothing to clothe the whole population and not even enough food for the whole nation but in pre-revolutionary days all the people of the nation could not get food even daily, while some of the upper classes

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

used to eat in gold dishes and throw them away—now though we don't get good quality of food, all of us get sufficient food to satisfy hunger, and in our Second Five Year Plan we will have more light industries, *i.e.*, food and cloth ; our standard of living will be raised."

We came before the Intourist office, pushed the revolving glass door and went inside. It was "Pramila Kingdom," where there are only women. Not a single male clerk came to my notice, all were ladies. I asked my guide, "Well, have you driven out the other sex from office works ?"



The first residence of the Cental Committee of the Communist Party—Leningrad. From the arrow-marked balcony Lenin delivered his first lecture after his return from foreign land.

She replied, "Yes, they have to do heavier works. Factories have absorbed all male labour, so we have to do all these light works."

"So you are the bourgoiousie now and males are the proletariat," smiled I.

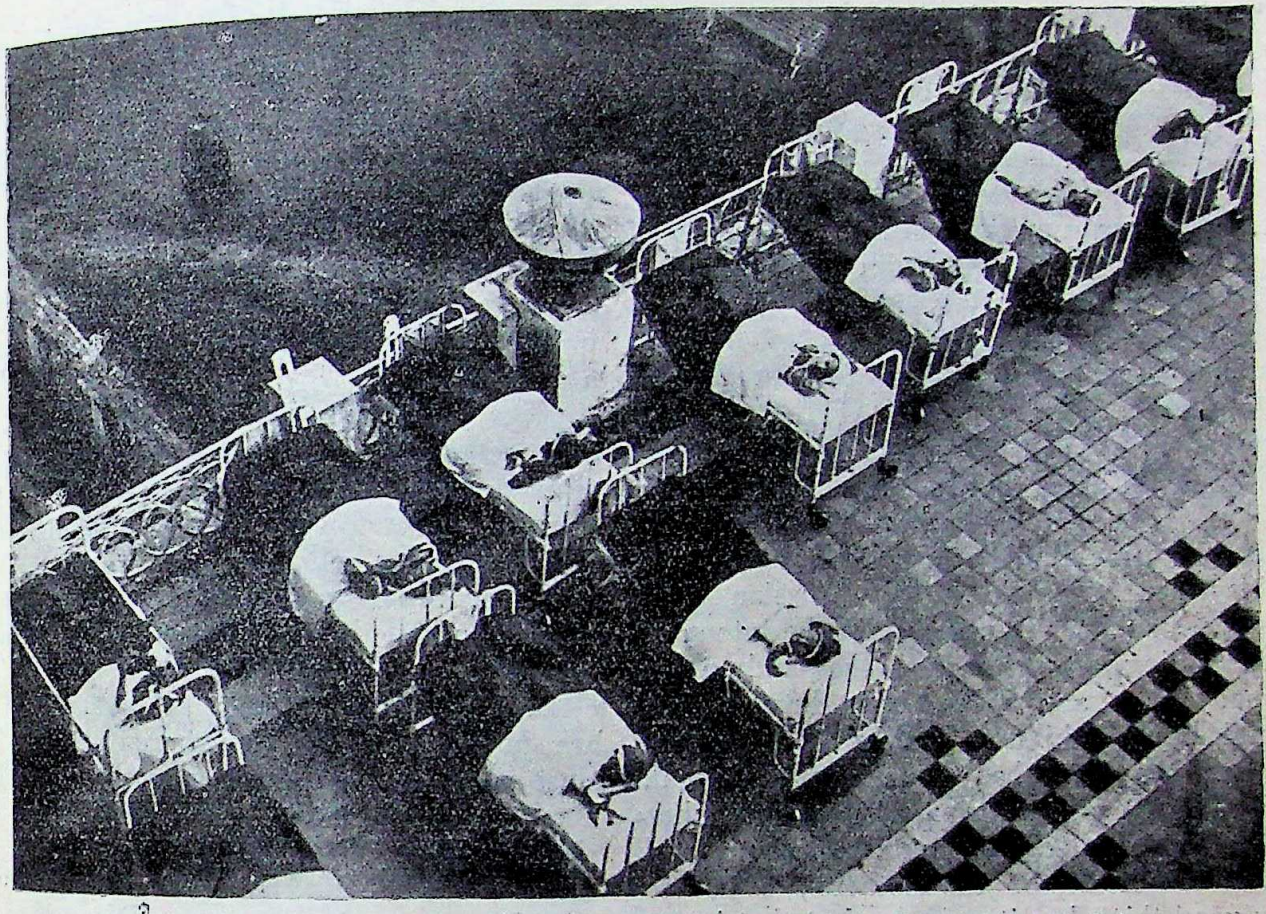
"But we never fear heavier works. There are female tractor and locomotive drivers, soldiers and even envoys. Owing to our physical difficulty we may not do some works but we never fear any work," protested she.

This is true. Even the tram drivers and conductors were females. But what a horror is a Russian tram ; they are always packed to the inch—about five to seven passengers always hang on the footboard holding the iron handle. At the stoppage it stops for a whi never cares whether the passengers cou get in or get out. One has to force his wa into the trams but first of all he should mak a little place for his one foot to hang on th footboard—then gradually by outside pus and through his effort he can make a roo on the platform. There are only two line of benches inside, each is broad enough t accommodate one person only. Trams ar meant for standing. The window glasses ar all smeared with hard snow with a sma circular gap caused by the fingers o passengers eager to se their destination. It i impossible to bend dow to take anything fro the floor. I remembe an incident. A passenge before leaving the ca cried, "I have lost on shoe—it has just slippe off my foot." Every on bent his head down wards but none dare or could search it becaus every one is jammed an the poor passenger ha to get down with on shoe on. One thin surprised me. The peopl were so poor, but non was eager to deceiv the conductor by no paying the fare ; instead the passengers wer passing their money to the conductor throug fellow passengers from one corner to the oth corner. It seemed everyone thought it the duty to pay the fare, as they knew the tram car were their own property. The so-called morali countries should learn the honesty of th Russian poor. If anybody wanted to ge down at a certain stoppage he should try t make his way out before two or three stop from the destination. In winter such rush i to some extent relieving, but God knows wha it is in the summer.

We got down near a "Creche" as she tol me, the "workers' children Home." We pu off our overcoat and over-shoes in the cloa room and went upstairs. My guide asked

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri



Children basking in the sun on the roof a "Creche" (Hospital)

the permission of the in-charge, who was a lady, to see the institution. She smilingly agreed and requested us to put on a long milkwhite apron before we went into the children's rooms.

In this Home, children from three months to three years old are brought up. The working mothers get one month's leave before and two months' leave after the delivery with full pay. Dancers and others who have to undergo more physical labour get four months' leave. On the third month after delivery they have to go to work. As Russia is trying and has been succesful to a great extent to abolish the family, these children's Homes became necessary to look after the young three month old babies. Russian labourers work in shifts, so that machines can work twenty-four hours. Every mother before going to the factory leaves her child in these Homes where they are carefully looked after and on her way back the mother takes her child home. There are many who say that Russia has no home life; as children are looked after by the State, mothers have lost their affection towards their children; as there are no strict rules regarding marriage, fathers never care for the children. But surely these allegations are not true. The Children's Homes have freed the mothers from the responsibility of rearing their children and thus enabled them to render their full service to the State. Similarly common kitchen in factories, common laundry, and community houses have freed half the strength of the country which wasted its energy uneconomically. Formerly, in each family women had to spend their energy in rearing children, cooking, washing, cleaning and other household affairs. Now the small family units have been crushed in towns and greater families are made. These families live in community houses, have their food from one kitchen, their dresses cleaned from one laundry, they have one library to read in, one club room to meet. Mother's love can not be washed away by a thousand more such Russian revolutions—it is an inborn instinct—it exists even amongst the birds and beasts, so family life can not go. But true it is that the family life in Russia has taken a different shape from that

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

in any other country and this is due to the new economic policy of the State. For the whole day the child remains in a Children's Home, the mother gets half an hour's leave every day to feed her child and after the day's work she presses her baby on her breast, showers kisses on it, wraps her in cotton bed and takes it back home to share the delight with her husband. I have seen many a young and old mother in this home to fondle her baby, to kiss it incessantly and press it on her breast to feel the sweet dreamy touch of the angel of heaven. How can family life go where the family is in the hands of such beloved mothers? In Russia even the conception of motherhood is different from that of any other continental or American countries. The Russian girls think it debauchery to marry with the intention of not having any children: the children are national assets and it is their duty to give the nation more children, healthy and worthy. Of course the State has made abortion legal, teaching birth-control through its doctors; but that is only to check unwanted children and to save the health of the mothers; of course every good thing has its abuses, but that is not to be counted. Before the age of majority the Russian children are barred from doing any heavy labour and can claim maintenan from the parents. So how can father and moth have no family? But in a Russian fami if you want the Hindu or Catholic regard a son towards parents, probably you will disappointed. The Russians have no place f sentiments, they are realistic to the backbo There are a thousand and one examples whe a son has denied all connection with a 'Kul or (formerly) rich father to have the right a proletariat.

The Children's Home was spotlessly cle and everything was in order, complete disciplin reigned there. First, we were taken into a roo having numbered almirahs where the dirty hom dresses of the children are taken out a kept according to number. Next, they a taken to a hall having rows of pots to answ nature's call—then they are bathed a cleaned, new clean dresses are put on and th are placed in their numbered beds. Th sleep, play and eat together at the same ho I asked, "How is it that these babies ev sleep together. Don't some of them cry a disturb others?" The guide interpreted t attending nurse's answer, "No, if fr childhood they are taught to do every thi together, they do it and will do it for life"

THE RED CROSS AND THE BANNER OF PEACE

By Hon. HENRY A. WALLACE

Secretary of Agriculture, Third International Conference for the Roerich Peace Pact

November 17, 1933. Washington D. C.

IN these days of great discord it is well for those who have faith in our common humanity, regardless of nation or class, to meet together. Those terrible forces unleashed by the World War have too long caused the nations to fight each other with the deadly economic weapons of tariffs, quotas and speculative currencies. This economic warfare has, by throwing men out of work on a world-wide scale, caused more impoverishment than the actual physical warfare from 1914 to 1918. Unfortunately, we have no machinery for declaring an Economic Peace. As we look at the complexities of the tariffs, the quotas, the currencies, and the International debts, we see possibilities for endless strife. Here in the United States we have bound the world t us by loaning billions and billions of dolla and at the same time have thrust the wor away by our tariff policy. Many Europe nations have striven desperately to keep o American products by tariffs, quotas and currenc manipulations. In this way, with everyone blame or no one to blame as you plea the world has arrived at its greatest stage heartsickness.

In such a time the opportunities are gre for those in position to hold up before the ey of the world the idea of the Unity of the Hum Heart regardless of Nation, in the worship beauty of culture, of science, and of educatio

Hatred, prejudice, fear and greed have acted as the virus of a dread disease to make the whole world sick, but fortunately the world like the human body builds up resistance. The anti-bodies, the white blood corpuscles which restore health to a sick world have to do with those things which transcend national boundaries. These finer, broader, human aspirations which are so important are often intangible to many people unless materialized by symbols, pacts and organizations.

Many symbols have been used for broadening the human mind. One of the most ancient and useful of these has been the cross, symbolic of infinite sympathy with suffering. A modern adaptation is the Red Cross, conceived and promoted originally by Henri Dunant, a Swiss who witnessed the terrible suffering of the wounded at the Battle of Solferino, Italy, in 1859. Conventions were called in Switzerland and finally in the late sixties most of the European nations had signed the agreement, establishing the Red Cross as the International symbol for the alleviation of physical suffering. For many years Clara Barton and other humanitarians strove to get the United States to adhere to the Convention of Geneva but it was not until sixteen years had elapsed and thirty-one other nations had signed that Clara Barton, by making a direct appeal to President Garfield, was able to cut the red tape which had kept the idealistic heart of the United States from manifesting itself in its true light.

Tonight we are concerned with another symbol strangely like the Red Cross in many ways. The Red Cross is concerned with the healing of wounded physical bodies—the Banner of Peace is concerned with the healing of hurt souls, spiritual bodies wounded by international discord, fear, hatred, greed and ugliness. The cross suggests the Trinity, unity in diversity and finally infinite compassion, however great the misunderstanding. The Banner of Peace with its three dots in a circle tells the same story but here we are dealing with the spirit rather than the body.

The Roerich Peace Pact of which the Banner is the symbol, aims to protect in time of war the cultural body of mankind, the Universities, the Libraries, the Art Galleries, the Cathedrals and other treasures of the spirit. If they are registered as institutions of culture and fly the Banner of Peace, they thereby become recognized as neutral territory by the signatory nations. Would that the nations of old had flown the Banner of cultural unity in the midst of national diversity and that we might have preserved the Alexandrian Library to this day. And while we today still retain a considerable amount of our pre-war optimistic confidence in endless progress, there are many who now shudder at the thought that the barbaric, disintegrating, hateful forces may finally reduce some of our most precious treasures to the status of the Alexandrian Library.

It is to the manifold genius of Nicholas Roerich that we owe this plan. For thirty years, since he first pronounced his concern for the preservation of the world's cultural treasures, he has dedicated himself tirelessly to this ideal. And tonight, when the end seems so close of fulfilment, we may send to Nicholas Roerich our tribute as a creator and as an indefatigable leader in the cause of world cultural unity.

The World War wounded and killed millions of physical bodies—the post-war has maimed hundreds of millions of spiritual bodies. We have all seen friends and relatives whose inmost being has been twisted by the hatreds and prejudices of these terrible times. Whole nations, writhing in their pain, have practically gone insane. The terror created by the worldwide despression of the past three years has been almost equal to that of the World War itself. And the end is not yet. The nations are still shrinking fearfully away from each other, erecting barriers against each other, using tariffs and depreciated currencies to harm each other at the expense of the general good.

We in the United States during the past four months have plowed under ten million acres of cotton and slaughtered six million little pigs in a desperate attempt to behave as a creditor nation must behave when it has destroyed the foreign markets for its surplus by high tariffs. As we contemplate further acts of nationalistic contraction, we perceive an infinite number of re-adjustments and we wonder more and more how far we should travel the path of national self-sufficiency. It is urged that we should recognize that we are a part of the community of nations by reducing our tariffs as a creditor nation sooner or later must and by furnishing leadership to bring order out of the international monetary chaos.

But behind all economic forces and all International Conferences are the simple things which have to do with the attitude of the human heart. The universal appeal of the Red Cross is based on this simple fact. The Banner of Peace comes to the attention of Americans today at a time when it seems all mankind has lost faith in International Conferences and Disarmament Conferences, when it seems that the nations were never more suspicious of each other. I am not one to urge an idealistic symbol, such as the Banner of Peace as a substitute for effective action in the world of hard economic facts. But I do say that it is high time for the idealists who make the reality of tomorrow to rally around an International Flag of Cultural Unity. This is no narrow proletarian Bolshevism that I am preaching but an appeal to that appreciation of beauty, of science, of education which runs across all national boundaries to strengthen all that we hold dear in our own particular governments and customs. If the Cultural Flag, this Banner of Peace, this symbol of International

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Unity is lifted up in these dark days by the stronger nations, we may speedily realize the vision of Isaiah when all the nations will come to the mountain of the Lord and Universal Peace will descend.

Strikingly enough the flag of the United States is very similar in its concept to the Banner of Peace. Our flag is a symbol of the unity of 48 diverse states. The Banner of Peace represents diversity by three dots and Unity by the enclosing circle. I trust that the time may come when this symbol will be held dear by all who truly love their own nation and in addition appreciate the unique contributions of other nations and also are prepared to do reverence to that common spiritual enterprise of mankind which draws together in one fellowship all artists, scientists, educators and the truly religious of whatever faith. These men of good will have been scattered and discouraged. Let them lift up their hearts unto the Lord of the Unity of the fundamentally worthwhile things of the spirit and it will not be so long before International Economic and Disarmament Conferences will be a success.

In the world of practical affairs, many of the leaders, whether in business or in politics, tend to lay their emphasis on legislation and the social machinery which is built therefrom. All this is important and I would be the last to decry the work which has been done by the emergency organizations working out from Washington during the past six months. Yet as I have watched these efforts representing literally hundreds of millions of human contacts, I have reached the conclusion that social machinery, no matter how intelligently constructed and sympathetically administered, cannot by itself be enough. I believe wholeheartedly in the New Deal but it is absolutely essential as every responsible person in the nation wrestles with the problems precipitated by the New Deal that all of us become imbued with the concept that our efforts are directed beyond benefit to a particular class or region or even the nation itself. To make us feel truly at home in this universe, all of us are helped by the thought that our efforts are ministering to the long time good of mankind. Such concepts are necessarily vague. They have to do with the emotions of the human heart and cannot be set down in words. But after all is said and done, these things which have to do with the attitude of man toward the universe are the fundamental realities, and the handicraft of man that we see about us is the shadow.

In this connection, I like to think of the concept of Spengler who finds all civilizations going through spring, summer, fall and win[ter]. In the spring time, he finds the spirits of m[an] bursting with the importance of their attitu[de] toward the universe. At first this attitude h[as] no very tangible method of manifestation [but] shortly it pushes forth in the region of cathedral[s] painting, literature and music. Then finally [the] intellect comes to triumph over the heart, scien[ce] brings control over nature, and there comes [a] period when the abundance of material thin[gs] first gives man great pride of conquest a[nd] finally demonstrates the inadequacies of [the] purely intellectual approach. Then comes [the] time of great danger when men tend to lose fa[ith] and question whether anything is really wort[h] while after all. This in paraphrase is the schem[e] of civilization as set forth by Spengler, [the] German philosopher, and Petrie, the gr[eat] Egyptologist. This outline of the rise and f[all] of the human spirit is truly suggestive and, [in] my opinion, only very partially true. U[p] doubtedly the supremely important thing in [a] civilization is the faith which animates myria[ds] of human hearts simultaneously by some divi[ne] contagion of the spirit.

History repeats itself but always in a n[ew] way, and I trust against an ever larger ba[ck] ground. This would seem to be especially tr[ue] at the present time. The extraordinary faith [in] the sacredness of the individual which has ser[ved] the world so well for so many centuries is n[ow] apparently about to be merged into a lar[ger] concept, a striking symbol of which is the Bann[er] of Peace with its crimson circle enclosing th[e] smaller spheres. As this concept more and m[ore] pervades the world, we can have the individu[al] person and the individual nation each striv[ing] to attain his own unique destiny and his o[wn] type of perfection with a simultaneous resp[ect] for the strivings of others and a recognition th[at] all such efforts are comprised in the larger wh[ole]. This dream which is essentially the same as t[hat] of Micah and Isaiah of more than 2,000 ye[ars] ago can be fulfilled in considerable meas[ure] during the next century.

I am here tonight because I believe that i[n] this dream which gives reality to all our eff[orts] to create material wealth and work out [an] improved social machinery for distributing [the] wealth. We must have a unifying principle [to] which all our hearts can give supreme allegia[nce] while we work out in the sweat of daily effort [the] millions of difficult details. In this way we [can] work with faith and joy anticipating the spiri[tual] reality of which the Banner of Peace is [a] symbol.

PLAY AS A FACTOR IN SOCIAL EFFICIENCY

By J. M. KUMARAPPA, M. A., Ph. D.

SINCE Nature has made the child a playing animal, he spends almost all of the energy he develops in motor activity. His first interests and achievements are almost entirely physical. The child does not play because he is young; he is young in order that he may play and thereby prepare himself for life's activities. Play being in harmony with his nature, he enters into it whole-heartedly, and through unconscious exercise acquires an adequate physical basis for his life. In the course of his play he develops his reflexes, increases his powers of physical control, makes his nervous and digestive organs strong, his blood pure and his heart and lungs sound. In addition, he gains precision in his movements, an accurate knowledge of his environment and enough resistance to throw off the disease germs. In short, through play the child acquires health, strength, endurance, grace and symmetry. But the effects of play are not merely physical. Even the mind of the child gets through play the exercise it requires for proper development. In fact, play develops it more effectively than does the traditional school work. Similarly, play satisfies also the deepest propensities of the child's moral nature.

In view of the fact that play stimulates every phase of the child's growth, educationists and philosophers have emphasized from early times the importance of play in education. "Education" said Plato, "should begin with the right direction of children's sports," and likewise Froebel, the noted educationist, declared that "the plays of childhood are the germinal leaves for all later life." In spite of such trenchant pronouncements from time to time, we have gone on taking the child out of his play and sending him to school regardless of Nature's way of educating him. And what baffles understanding is the fact that even now we have not become fully aware of how hopelessly we have failed to realize not only that there is something more important to the child's future than the acquisition of information but the vital point that the child's way of educating himself is through his play.

Though the physical and mental effects of play were the first values to be discovered, its social and moral influences were unobserved until some of their necessary consequences became too patent to remain hidden from the view of the sociologist. That some of the world's great teachers have long since discerned the values of play is true, but the popular mind has not followed them and the discovery had to be made anew. Even now the social values of play have not yet been given the consideration they deserve. Hence the writer's purpose in this article is to confine himself to a brief study of play as a factor in social efficiency. Even in the West the place of play and its social meaning in the education of the child have come to receive recognition only recently. Though the Duke of Wellington, when asked to explain his victory at Waterloo, is reported to have replied that it had been won years ago on the playgrounds of Eton, yet we have been very slow in realizing that the playground is the place where the child learns to lead and be led, to live and let live, and play the game in the struggle for existence even if the odds are against him. The child's real world is the world of play, and he thinks and acts in terms of play. Naturally therefore it is in play and playground companionships that he gets nearly all his experiences and forms almost all his habits. In the playground his choices are innumerable; he acts as a free agent and creates his own ideals. It is there that he does what he wants to do and acts from the inner law of his own being. Such actual participation in life and its various responsibilities afford a training for which no other substitute can be found.

The moral and social influences of play produce indelible effects on the child for good or ill, as the case may be, and leave their traces upon his character. No doubt,

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

unorganized and spontaneous group play often develops the bully or the coward, but well-planned and supervised play minimizes these defects and impresses upon the child's mind the ideals taught by method and co-operation. Few children are instinctively generous; the majority of them being selfish need the companionship of other children to round out their rough corners. And through the medium of the supervised play children soon learn,—though they have no clear idea to begin with of the rights of the individual,—that no group of children can usurp all the privileges, that the right to use a play outfit cannot be monopolized by any one, that all things should be held in common and that every child must be given an equal opportunity. Play thus helps to eliminate from the child's mind the vulgar or street notion that might is right and inculcate in him the idea that others also have rights and they must be respected. In this manner he gradually learns to recognize mutual rights as a principle in co-operative living. Need we point out of what profound significance this development of the notion of mutual rights is for the growth of a healthy citizenship? Our rapidly increasing communal consciousness, social and political expansion and the increasing number of contacts which they involve, demand new limitations of rights and a more ample recognition of the boundaries of the group and the individual. Our short-coming in municipal government and other public activities can be remedied, at least in part, by teaching the young both the extent and limitation of rights. Does not this fact alone, namely, that play gives the child the much-needed training in the recognition of mutual rights, entitle it to be regarded as a most important school for the training of citizens?

Allied to the development of this recognition of mutual rights is the growth of self-control, which is a natural consequence of the former. The social results which follow are expressed in such ethical values as order, obedience, self-denial and discipline. The self-repression or self-control, which develops from the influence of play, makes obedience something more than unwilling subordination. When the child gets the idea on the playground that he should play the game according to its rules, he carries these same ideas into busine and plays the game there according to t rules of the business world. As children, th do not, of course, learn business or financi honesty; the idea of honesty they form is personal relationships which occur almo entirely in play. Then again, the playgrou is really a voluntary democratic organizatio Here the team elects its own captain a obeys his orders. It is necessary for t members to subordinate themselves and tak the position assigned to them whether th like it or not, and yet their implicit obedien to the captain and the rules of the playfi is striking and cheerful. But how differe is their attitude towards the rules of t school! The school, they think, is an absolu monarchy where the word of the teacher law. Not so the playground; to them t playground is a perfect democracy where t rules are of their own making and hence sel imposed. But the rules of the school a imposed upon them from without. What really worthy of notice here is the fact th the child wants to obey the rules of t playground because they are in harmony wi his nature and his needs. The boy, who th develops the spirit of obedience on the pla ground, learns, as he grows up, to respe authority and to obey the laws of the State.

But that is not all. Play emphasizes a the importance of the group as against t worth of the individual. The success of t team is soon recognized as more import than the brilliant achievements of a sing player. And the necessary concessions to t interests of the group demand certain sacrifi of the interests of the individual. The i of group life, of "social oneness," an ethi quality of unmistakable value, is t developed. Is not this idea of the welf of the group at the apparent, but not re cost of the individual, which play emphasi in direct harmony with our pres social need? The most important traini given in this direction, we may say, is that loyalty. Perhaps the greatest need in civic life of every country is that its citi shall acquire a community sense, that they be able to think in terms larger than those their own individuality, and be willing to w unselfishly for the organization, the city or

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

country to which they belong. The spirit of loyalty is an essential qualification of a true citizen, a selfless patriot. A person who thinks only of himself and his own welfare is a bad citizen, but he who always thinks of himself as a member of a larger whole to which his loyalty is due, is a good citizen. Loyalty, asserts Prof. Royce, is the most fundamental virtue, more elementary even than love in the moral code. How then is the child to cultivate this virtue ? Is there any other way by which the child can more easily get the necessary training in this important feature of citizenship ?

The easiest way to nurture this community sense in the child, this feeling of loyalty to a body larger than himself, is to encourage the child to participate in team-games. As a member of the team, he is obliged to do many things in its interest,—which in his own personal interest he would rather not do,—in order that the team might be successful. And this spirit of loyalty is spoken of as good citizenship when manifested in his relation to the city, and as patriotism when pressed into the service of the country. It is needless to say that this spirit of selfless devotion to an institution is most necessary for the success of any democratic government. Even the conflicts of the playground are of some service in building up the child's character ; in fact, they awaken in the child his first notions of social justice. Further, the child's experiences of the organization and methods of play and the playground help to produce in him a sense of the value and uses of order which is the mainstay of social stability. So also that type of instant decision and execution, which is most valuable in social living, is derivable from games and athletics, inasmuch as all good play involves a discipline in instantaneous judgment and in the immediate execution of that decision with all the power that the child possesses. Whether or not men shall be successful in the management of public affairs depends almost entirely upon their training. Therefore the social values, which games teach, will play no mean part in preparing them for civic and national responsibilities.

Another of the most valubale results of play is the growth of the instinct of co-operation. Since co-operation is the essence of the democratic movement, the capacity to co-operate on the part of the citizens needs further enlargement. While ability to work together spells ability to excel, the absence of this power means disunion and ultimate chaos. Practice in accomplishing a given task in co-operation with others impresses boys and girls with the immense value of concerted action. Since every child is expected to participate in the activities of the playground, the individual begins to learn that he is necessary for the success of all, and also that without his co-operation neither he nor his associates will be able to enjoy themselves. Thus through practice and sheer necessity, the child increases his capacity for co-operation. The citizen will not function wisely until he learns the value of co-operation and feels himself a part of the government. If his government is only moderately successful, he must feel the disparagement ; if it fails he must share in the disgrace ; if it succeeds, he may rejoice in the accomplishment as he would if it were entirely his own. Every achievement of the group will inevitably reflect itself in the attitude of the individual if the true spirit of co-operation prevails. The successful adjustment of the individual characteristics to those of the group so as to make the interrelation possible is a prime task of the playground, and nowhere else can it be effected so satisfactorily.

Play is social in character and naturally therefore another of its positive social values lies in the effectiveness with which it brings together on a common level children of different castes and social standards. Children of all castes and religious groups are alike in their need for play, and the ideals of the playground are more or less the same for all. This common human need and this common mode of its expression furnish a basis on which children of all kinds and conditions can meet. Surely no better opportunities than those furnished by play could be desired for allaying caste prejudices, mitigating social and class differences, and laying the foundation for the recognition of our common humanity. The danger to a wholesome civic life in India lies in the communal conflicts and caste prejudices, in the lack of sympathy and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

understanding and in the persistence within our gates of irreconcilable and hostile elements. But the opportunities afforded by organized and supervised recreation for accomplishing this task of unifying the discordant forces are certainly very great.

Play engenders under normal conditions a spirit of friendliness and good followship which creates an ideal atmosphere for the development of social graces. Play makes children thoughtful and courteous, and draws out the finer qualities of the spirit. Training in friendliness and companionableness have not been thought of as part of an education. Is there anything we are now giving in the school that means more for either success or happiness than the ability to make friends? The very best discipline the child can have in the art of living together comes not so much from school life as through social play of its childhood. All the great social movements of the present are nothing but expressions of the growing sense of racial solidarity, of human brotherhood. Anything that can help to train the children in this direction will be in line with the spirit of the New Age. If we wish to see more love and sympathy in this world, one of our first efforts must be to provide well-organized play for children and promote the right sort of sociability in them. Does not play, in view of the fact that it is really the most effective teacher of that kind of comradeship, which makes for political unity and racial amity, deserve a more prominent place in our system of education?

Then again, think of the training play gives the boy in sportsmanship. It trains him to play fair; to try to win and work all the harder when the odds are against him; to take defeat with a smiling face and come back to try his luck again; to accept the decisions of the umpire and not to try to avenge himself for his defeat by harming or insulting his opponents; to treat the members of the visiting team as guests and give them the position of advantage. Indeed, no better training than this is needed for civic conduct and social behaviour. No opportunity therefore for discipline in social living is more significant than that afforded by play, and if the school is to strive toward the ideal of social efficiency, it can ill-afford to neglect the play life of boys and girls. Like all else, play is the soil from which evil as well as good may spring up. Hence if the possibilities for good is to be fully realized, play must be made a subject of serious study and careful direction.

Only recently has there come about a recognition of the opportunity made possible by play and the playground for training in social relationships and for building up in boys and girls the best social ideals. We have already seen how play tends not only to give physical efficiency, a good carriage, a full chest, a stable nervous system, a good digestion, a healthy sex development, strong heart and lungs and robust health but to develop in a rudimentary form the best types of social virtues. Such fine traits of character as loyalty, honesty, truthfulness, social justice, sportsmanship, generosity, respect for law and authority and devotion of one's self to the welfare of the group, emerge, quite naturally and spontaneously, in the life of the playground. Could any nation afford therefore to overlook the importance of play in civic training? Is it not regrettable that we in India have not yet begun to appreciate the great importance of play in building the character of our future citizens? If play is so significant a factor in the education of the child, should not the State spend more money on supervised play and the playground? When it means so much to the child's mental growth, should not play be given at least as much of his time as is devoted to one of his studies? If play develops all phases of a child's life, should not the opportunities afforded by it be used to their limit to bring about his complete and harmonious development? If our children are to learn team work, imbibe the spirit of sportsmanship, develop the capacity for neighbourliness and form the habit of subordinating selfish to group interests, then they must be enabled to acquire these through experience, and it is play and the playground,—not the text-books,—that provide the necessary opportunities for such moral and social discipline. Therefore, if we want to make the child a social being, to live at peace and harmony with his fellows and to co-operate generally as a good citizen, we cannot afford to ignore much longer this play way of training the child in social virtues.

THE PROBLEM OF MINORITIES IN SOVIET RUSSIA

By SASADHAR SINHA, B.Sc., Econ., Ph.D. Econ. (Lond.)

THE difficulties presented by national conflicts on the wide arena of the world have their counterpart in the problems connected with the various national minorities. Like nationalism, group loyalty, racial, linguistic and cultural, within the national boundaries proves more virile than is commonly supposed. The emotional drive behind it, unless afforded full play, may prove a constant source of trouble, even ultimate danger, to the body-politic. It cannot be suppressed. It has never been suppressed. It grows on conflict. National unity at the expense of the minorities has been attempted again and again. It was tried in Ireland; it has been tried in the case of the Jews in all Western countries; it is being tried in Germany at this very moment, but, in the long run, wherever the minority group is sufficiently large and exists in intimate spatial relation, it has succeeded in keeping itself distinct, ready to leap into resistance at the slightest provocation. It is nationalism in miniature. Like nationalism, the problem of minorities cannot be solved by simply ignoring it. The problem needs more radical solution.

A novel, and by far the boldest, solution of this delicate question comes from Soviet Russia. The Russian solution naturally forms an integral part of Communist philosophy, which in the last resort envisages a world society, but the lessons of this solution are such as to be of universal significance.*

Russia, like all vast countries, is a conglomerate of racial, linguistic and religious minorities. In 1926, for instance, it was estimated that Soviet Russia contained 185 racial and 147 linguistic groups. On the other hand, besides Christians of many sects, there live in Russia Muhammadans, Jews and Buddhists. In the pre-War days Russian Imperialism followed the steam-roller method of "Russification," recognized only Russian as the official language and Greek Orthodoxy as the State religion. The Jews and other non-Russians, the *Inorodtzi* (literally, the foreign-born), inhabiting the East, were treated as aliens. They had no civil rights. Thus, although the Russians were in a minority, *i. e.*, 43% of the population, the "official statistics managed to contrive a Russian majority of 63% by counting in the Ukrainians and the White Russians." The Government pursued a steady policy of apotheosizing the Russians over all the other ethnic groups in the Russian Empire. As members of the Imperial race Russians enjoyed privileges everywhere. In Asiatic Russia, for instance, the indigenous populations were deprived of their best lands in order that the Russian colonists might settle on them.* Everything conspired to keep these people economically and culturally backward. Even in European Russia this policy found its echo. In the zeal for "Russification" the use of Lithuanian, Ukrainian and White Russian languages was forbidden. It was not until after the Russo-Japanese war that books in these languages could be published. Although the claims of the minorities were thus ignored, they were not thereby suppressed.

Indeed, in direct conflict with this centralizing policy, local nationalism had steadily grown throughout the Empire. Among the Western border states, its origin can be traced back to the 19th century, while Pan-Islamism among the Muhammadan populations grew with the resurgence of Muhammadanism in the Near East in the present century. Nationalism among the oppressed minorities and the revolutionary movement among the Russian intelligentsia went on hand in hand,

* *Cf.* Dr. Hans Kohn's brilliant book on "Nationalism in the Soviet Union" (Routledge, 1933). This was written after the author's visit to Russia in 1931 on behalf of the *Frankfurter Zeitung*. Dr. Kohn's "A History of Nationalism in the East" (Routledge, 1929) is probably familiar to many readers of the *Modern Review*.

* *Cf.* Tolstoy's parable "How Much Land Does A Man Need ?"

one reinforcing the other. This alliance was not always plain-sailing, because the Russian revolutionaries themselves were often patriotically-minded. Nevertheless, so long as open conflict was averted, it was a source of strength to both. It is well known that the abortive reforms of 1905 were won by joint effort.

The assumption of power by the Bolsheviks in 1917 immediately brought them face to face with the national question—the question of minority rights. The collapse of the Tsarist Empire let loose two forces, which were equally important and equally dangerous. The growth of "Pan-Russian chauvinism," as Lenin called it, among the revolutionary leaders on the one hand, and the growth of separatist movements among the national minorities on the other, boded evil for the future of the revolution. "Pan-Russian chauvinism" thus stood for centralization, breaking down all barriers of race, language and religion, and the creation of a State to all intents and purposes Russian. Behind all this quibbling with words, it was evident that the old imperial ideal was reasserting itself, but only in a different garb this time. The renewed vitality of nationalist sentiments of the racial minorities showed at the same time that the situation called for delicate handling. Slavophilism in any form would set the powder magazine ablaze. Lenin's analysis of the problem or rather problems presented by these two points of view, diametrically opposed and yet not irreconcilable, was characteristic. At the Eighth Congress of the Russian Communist Party (March 19, 1919), Lenin said :

> "It seems to me that the Finnish example and that of the Bashkirs show that in the question of nationality it is not possible to proceed from the assumption that economic unity is necessary at any price. Necessary, of course, it is. But we must attain it through propaganda, through agitation, through a voluntary union. The Bashkirs distrust the Russians, because the Russians are at a higher level of civilization and have used their civilization to rob the Bashkirs. Consequently in these remote districts the name Russian means "oppressor" to the Bashkirs. We must take that into account, we must combat it. . . We have only now learnt to manage better, and even that only some of us yet. Thus there are Communists among us who say 'uniform schools', and accordingly no instruction to be given except through the Russian language. In my view a Communist who thinks in this way is a Pan-Russian chauvinist. . ."*

The solution followed as a matter of course. The Russian Communist Party firmly laid down the principle of self-determination for all peoples and their complete right to secede from the Soviet Union. This was a solution at once bold and constructive. At one fell swoop it took the wind out of the sails of extravagant local patriotism smarting under Russian oppression, supposed or real.

It is only natural that this policy did not meet with the approval of extremists on either side. The so-called "Left" internationalists opposed it on the ground that it went off at a tangent to the growth of international solidarity, while nothing but complete national autonomy would satisfy ultra-nationalists. Lenin set his face against both. To him, as indeed to all true Communists, nationalism is not an absolute ideal—the *summum bonum*. Lenin recognized it, but only as a relative concept, as a stage in the progress towards an international society. He said: "To refuse to recognize the Thing that Is, cannot be permitted: recognition enforces itself." In the second place, the recognition of national autonomy would have gone against all his teachings. The realization of a supra-national outlook for Russia, which would bind all its units in harmonious co-operation, was for him vital for demonstrating that internationalism was more than an empty cant.

Obviously, the recognition of formal constitutional equality† between the various

* *Cf.* "Nationalism in the Soviet Union," *op. cit.*, Appendix I.

† The Soviet Union is divided into seven autonomous units, *i.e.*, 9 federal member states, 15 autonomous republics and 18 autonomous regions. It is a federal constitution with various degrees of devolution. Purely local affairs, like law, public health, welfare organization and education are reposed in the autonomous units themselves. For economic, financial and labour questions, the Union and member states are held jointly responsible. The conduct of foreign policy, defence, transport, etc., lies within the competence of the Union acting through the All-union Central Executive Committee elected by the All-union Soviet Congress, the supreme organ of the Union. In addition to this territorial solution, elaborate precautions have been taken

racial and linguistic groups (religious or doctrinal differences are not recognized in Soviet Russia) is the beginning, indeed a very minor beginning, towards the effacement of the past which had embittered their mutual relations. The cultural and economic reconstruction of the Union has consequently rivetted the major attention of the Soviet authorities. With a clearness of insight, characteristic of Lenin, he had seen that what differentiates the civilized from the uncivilized lies in the last resort in economic and, therefore, cultural differences. Human nature is the same everywhere. Once this was firmly grasped, the whole approach to the minorities, or, what is the same, nationalities, problem was simplified. The main task lay in the levelling up of the cultural and economic life of the constituents of the Soviet Union. With the removal of the economic, often disguised as the cultural, motive, the minorities problem will solve itself.

Cultural work took the form of what in Soviet terminology is called the liquidation of illiteracy and the emancipation of women. Neither of them was easy. Among the non-Russians, in many cases, there did not even exist a written literature. It was a tremendous task. Nothing daunted, the Faithful set to work. The miracle has happened. National literatures, both literary and scientific, have grown up throughout the Union. Truly national indeed are these, because the key to the Soviet linguistic policy lies, as Dr. Kohn puts it, in "simplicity and popularization." At the beginning of 1931, it is reported, "A reading book for sociology for the first grade schools" was published in the Mari language, a language spoken by one of the Finnish-Ugrian tribes living in the extreme north of Russia, who before the war had no written literature of their own. Even in some of the more advanced areas, scientific studies could not, until lately, be carried on except through the medium of Russian. But so great has been the advance that by this year "there are to be sufficient teachers and sufficient lingual preparation to enable all faculties to use the language of the peoples." The task of women's emancipation, especially among the Muhammadan tribes of Central Asia, was fraught with explosive material. Any unnecessary haste would have spelt disaster. Co-education or free social intercourse among the latter would have been unthinkable in the early days. Special schools and special clubs had to be started for these eastern women. "'Red Yurts' and 'Red Kibitkas' were instituted in the areas inhabited by nomads and semi-nomads—transportable tents with which teacher and doctor and midwife and library went from camp to camp, held courses of instruction in reading and writing, in hygiene and the care of children, and made the women acquainted with their rights, and tried to organize them." All movements for freedom have their martyrs. Many a heroic Muhammadan woman paid with her life for her faith. Contrary to the usual belief, women had shown themselves more eager for their emancipation than their menfolk. Nevertheless, the civilizing influence has made rapid strides. Since 1927 the old caution on the part of the authorities has been found unnecessary. The "unchanging" East has begun to change. Indeed, in areas on a higher level of culture, like the Crimea, as Dr. Kohn points out, "the veil has completely disappeared. Tartar girls are increasingly attending the state schools . . . ; on the Corso in Simferopol they are hardly distinguishable in appearance and manner from Russian girls. . ."

In the economic sphere a similar policy has been pursued. In the pre-War Russia, the sole aim of the Russian industrial policy was Russia's enrichment. The non-Russian territories within the Empire were treated as virtual colonies. The Soviet authorities have completely reversed the process. A policy of decentralization is being deliberately followed with a view firstly, to bring up the economic level of the undeveloped territories to that of the more advanced, thereby strengthening the economic interdependence of the different parts of the country, and secondly, to create a native proletariat, who would be the backbone of the workers' state. The result of this policy is

to protect minorities, like the Jews, who do not live in any particular area. These minorities have their own schools and are allowed to use their mother-tongue for official purposes. On the other hand, when possible "they have been brought together in administrative units in which their language and their national characteristics have full play."

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

already reflected in the proportionately larger "tempo" of industrialization in the periphery as compared with the centre of Russia. The exploitation of one part of the country (or of one people) for the benefit of another has ceased. The policy of mechanization of agriculture issues from the same motive. The old antithesis between urban and rural labour, a source of friction and of backwardness in the latter case, must be abolished.

National self-determination, economic and cultural equality among the various units of the Union, however, do not in themselves or even in conjunction ensure a supra-national outlook. Indeed, nationalism often becomes an end in itself, and economic and cultural motives serve to reinforce it. The Soviet authorities themselves are well aware of this danger.* The building up of a common culture, the Communist culture, thus becomes the corner-stone of Soviet policy. In other words, this culture will be national in form but common in content. "The Communist state can grant entire lingual autonomy and liberty, but it cannot recognize cultural autonomy and liberty." It is in this sense that Party solidarity assumes such seminal importance. The party organization in consequence takes no cognizance of national differences. It is supra-national in character. It is believed, and from the party point of view no doubt rightly, that the ultimate defence against all fissiparous tendencies (as the Indian political jargon has it) must be the Communist Party which cuts across all racial and linguistic barriers and unites the party members in a common purpose. "The government and party machinery had to be 'rooted,' to use the official term, in the indigenous population, as the Soviet st could only so be assured of the acti co-operation of the broad masses among its peoples."

Paradoxically enough, the cultur backwardness of Russia has not been a unmitigated evil. The Soviet authorities ha a clean slate to write upon. For the bu of the Soviet citizens at any rate the cultur heritage to which they come is the on culture they have. Everything is new them. The generation that is growing u today, although speaking different tongu (and even that is not strictly correct toda is imbued with the same cultural outloo It is bound to be a source of enormo strength to the new Russian society.

Clearly, any constructive solution of t minorities problem must begin by recogniz the basic facts which constitute the differenc between minority groups. Race, langua and religion are real enough and often loose violent passions. Pan-Islamism Central Asia or the smouldering nationali in Ukraine or White Russia may yet disru the Soviet Union. And yet it may not. T mainspring of discord between nation minorities, as between nations, lies elsewher Dr. Kohn is probably right in his insisten that the success of the Russian solution the minorities problem will depend on t success of Communism as a whole. For, he says, "it cannot be otherwise with Comm nism, as an ordering of life that takes accou of all life, and aims at interpreting its meani by a universalistic and all-embracing conc tion of the history and destiny of mankind."

* *Cf.* Stalin's speech (July, 1930) in Appendix I, *op. cit.*

* It is reported that since the removal of Russian language from its privileged positi it is developing by free consent into a *lin franca* for the multi-lingual Union.

A PLANET AND A STAR

By NAGENDRANATH GUPTA

'YES, I know you love Narga and she loves you.' And then in reply to the unspoken question in Orlon's eyes I told him briefly how I had been an unwilling and unwitting witness to that evening scene in the wood when the first words of love had been exchanged between him and Narga.

'Have you spoken to Maruchi or any one else about it?'

'No,' I replied, 'I have kept your secret. Narga is her own mistress and except for the fact that she is a high priestess we would all welcome your union.'

'That is the trouble. I have never dreamed of loving Narga clandestinely, but my lips have been sealed on account of Narga's peculiar position. She warned me before and she repeated the warning this evening that if Karos and the other monks were to know that she has broken her vows and fallen in love with one of us our lives would not be worth an hour's purchase. Her power over them would vanish in an instant and although they will not offer her any violence they will certainly put our whole party to death and wreck the machine.'

'What do you propose to do?'

'The decision rests with Narga. During all these months that we have been away her heart has been torn with the struggle between her sense of duty and her own inclinations. I have told her definitely that whatever happens I will not expose any of you to any danger.'

'Tut, tut, danger and we have been bed-fellows far too long for any one of us to be scared by any danger signal. Narga must choose between you and her present position and if she decides to marry you we shall outwit the monks. I know that Maruchi will be pleased, though he is under the impression that Narga's heart is impregnable. You had better take Maruchi into your confidence without delay.'

'Not to-night. You see, Narga has not yet finally decided what to do, and however strong my own feelings I will do nothing to hasten or force her decision.'

'Quite right. But what about the sneak? He would like nothing better than to carry a tale to Karos.'

'I should like to wring his neck.'

'But it cannot be done. You will have to avoid meeting Narga every evening, for if Jomel were to see you together he would at once suspect the truth and then things would begin to happen. It would be safer for you to let me see Narga on your behalf.'

'I agree, but I must meet her at least once.'

'Let me come with you to guard against spying and eavesdropping.'

With this understanding we sought our beds for the night.

XLI

We were invited the next morning to meet Narga in the room where we had seen her before. Nabor went with us, but, Ganimet was mounting guard over the airship. Between him and Nabor it had been arranged that the machine should be watched day and night, either one or both of them being always present where the 'Mundanus' was kept.

Maruchi related our adventures and experiences and sometimes Orlon and myself added a few details. Karos and some others were present and behind Narga sat three or four young women novices, all listening with eager interest to the story we had to tell.

While speaking of what we had seen at Sipri Maruchi produced the instrument which had been presented to him by the scientists and handed it to Narga. She looked into it and exclaimed after a minute that it was wonderful as she could see objects and people at a considerable distance outside the room. The instrument went the round of the whole room and ejaculations of astonishment were heard from every one. When the penetroscope, as we had casually named the instrument for want of a better one, came back to Maruchi I took it from him and peering into it saw Jomel, who had not been asked to join our meeting, hanging about the entrance to the wing in which we were sitting. The sight of him gave me a sudden bright idea. With that instrument in my possession I could play the spy upon him far more successfully than he could upon Orlon or any one else of us and it would not even be necessary for me to follow him. I at once asked Maruchi to let me keep the instrument.'

'Certainly,' said Maruchi and went on with the recital of his story. When he described the Pompos and mentioned how we had captured two of them and afterwards restored them to liberty there were fresh exclamations of astonishment as very little was known about the Pompos and they were supposed to be a most dangerous and savage tribe. The mood of the hearers changed when Maruchi, with a fine and racy humour, described our experiences in the White City and City of the Kings. Narga burst into uncontrollable laughter when Maruchi gave

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

a vivid picture of the swaggering captain of the guard and the corpulent Governor of the White City and she nodded appreciatively when told of the acute and shrewd wit of Yoko. The account of the people in the City of the Kings not only amused her but set her thinking.

'Fancy a city,' she said musingly, 'peopled entirely by the descendants of kings and queens. And these people, as you say, have a lower order of intelligence than the common people.'

'I would not put it that way. We found them clinging to the memory of the past in a hopeless way and almost incapable of helping themselves. And consequently they had fallen lower and lower and lost all self-respect.'

'Yet you find a man and a woman among them, specially the woman Vanita.'

'Yes, in other times she would have made a great queen. I trust she will play an important part in the new order of things.'

'And you say you have roused them out of their apathy and made them work for their own benefit.'

'It was Orlon who woke them up and he spoke to them with the fire of a prophet.'

Narga cast a swift glance of admiration at Orlon but she would not let her eyes linger long on his face lest they should betray the deeper emotion in her heart.

Orlon said, 'I merely obeyed Maruchi's orders. He gives others credit because he is as modest as he is able.'

Narga said, 'You are all modest and you are all wonderful. Now tell me of your visit to the Master and to Raba.'

Maruchi spoke with deliberation. 'Something we may tell all but there are other things that we are not at liberty to speak about except to you alone, for you are among the initiates.'

Karos interrupted with some impatience, 'Do you suggest that the Master told you, who were utter strangers, secrets which he would not mention to his disciples or to us?'

'That is precisely what we mean,' answered Maruchi, 'and the Master knows that we shall respect even his unspoken wishes and what he was pleased to let us know in confidence is safe with us.'

'What was your claim to the Master's special confidence? I can hardly believe—'

'Peace, Karos,' broke in Narga in a voice of authority while her eyes flashed dangerously, 'you seem to forget yourself strangely. Who has invited your belief or unbelief? Who has constituted you the judge of the Master's discretion as to who are worthy of his confidence? I fully understand what Maruchi means and he is quite right. I think you are jealous, but such a feeling is unworthy of you.'

Karos held his peace. He was crest-fallen, but not quite convinced that he had been rightly reproved.

Maruchi described in glowing language the physical appearance of the Master. Narga murmured approvingly, 'There is no one like him.' Maruchi spoke of the Master's kindness and how he gave us lavishly of his wisdom. He mentioned our visit to Raba without saying a word about the secret passage and added how the Master had spoken to the pilgrims. He concluded with a few more words.

Narga glanced at him once and then turned to Karos, 'I would now be alone with my honoured visitors.'

Karos and the other monks left the room though we could see they were anything but pleased at their dismissal.

'And now tell me everything,' said Narga with frank eagerness.

When Maruchi mentioned that the Master had taken us to Raba by the secret passage, which he vividly described, and had displayed miraculous powers, and how he had spoken to us every day and at night for hours on the deepest spiritual problems Narga was very much impressed and said, 'You have been greatly favoured and very rightly. But since the Master knew you were coming back here had he no message, no commands, for me, his unworthy pupil?'

'He could hardly send any message through us for we are outsiders and know nothing about your Order. But he certainly spoke about you as we did.'

'Whatever he said must be helpful to me. Tell me what he said.'

Maruchi looked slightly embarrassed and flashed a question at me with his eyes. The question was whatever it would be right to tell Narga what the Master had said about her. And then Maruchi spoke to Narga with some hesitation, 'I am not sure whether the Master wished what he said to be repeated to you.'

With swift intuition Narga turned to me. 'You, Sahir, are my good friend, and I can trust you to tell me all that the Master said. He would not mention to you anything that he would not tell me to my face.'

I felt she was right and I repeated to her what the Master had said about her.

Narga listened with quiet attention and then said, 'The Master must be right. I must have been impatient and I must have foolishly thought that I had no other trial to pass through. Few of us can judge our own selves rightly. The Master refused to say anything about my future?'

'He refused to try to look into it on the ground that the future so far as it is the outcome of the past cannot be altered, and probably he did not wish to disturb his own mind by attempting to read your future, which he would be powerless to turn from its course.'

'I am very grateful to you, Sahir, for what you have told me and although the Master has refused to lift the veil of the future I think I understand what he had in mind. Let me now

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

think a little, but I hope, I shall have other opportunities of speaking to you.'

We rose for we saw Narga wanted to be alone. As Maruchi and I came out with Nabor, Orlon lingered behind and probably some words passed between Narga and himself which we did not hear. We had proceeded only a few steps when Orlon overtook us. Maruchi was somewhat surprised and asked Orlon, 'You had something to tell Narga ?'

'Yes, you will know what it was about in a little while.'

Maruchi asked no other question, but he became thoughtful. We came out. There was no one about. Maruchi and Nabor went straight to the building where the airship was kept. We followed more leisurely. As soon as the other two were out of earshot Orlon said, 'I have asked Narga to meet me this afternoon before sunset in the wood. I have told her that you know all. She was not surprised. She seemed to expect that you knew something from the way you spoke to her just now. She was rather pleased than otherwise for she has very great faith in your friendship. She will meet us both.'

'Good. As regards friend Jomel he will be on the trail whether by daylight or in the dark and we shall not succeed in shaking him off, but I propose to give him a pretty shaking when I catch him with his nose on the scent.'

I told Orlon of my little plan and tapped the instrument in my pocket. He rubbed his hands gleefully and his eyes were full of admiration. He chuckled as he said, 'You would have been a great man in the days when successful detectives were considered the greatest men.'

We found Ganimet at work on the machine and Nabor joined him as soon as he arrived. Looking at the two at work it occurred to me that we should be always in a state of preparedness. In spite of all my vigilance I could not hope to prevent Jomel from doing some serious mischief. Karos had been very much annoyed at being excluded from the latter part of our interview with Narga and although her authority was great who knew what would happen if the monks once took it into their heads that Narga had so far forgotten herself as to look upon one of us with eyes of love ? They would naturally come to the conclusion that she had been tempted and had fallen. Her power would at once vanish and the infuriated monks would wreak their vengeance on us. Until, however, the meeting with Narga in the afternoon I could not communicate my fears to Maruchi. I watched Nabor and Ganimet at work and casually inquired how long it would take to make the machine ready for our final flight.

Nabor briskly replied, 'We are quite ready. I thought it would take us some days to overhaul the machine, but we have examined it thoroughly and have found it in perfect condition. We may leave this moment if you like.'

This was reassuring. If we had not met Jomel at the monastery I would not have felt so anxious. The presence of this man portended danger, whether only to ourselves or to Narga also I could not say. I could only wait for the next turn of events.

When we returned to our rooms we did not meet any one. Perhaps Karos and the other monks were engaged, but even Jomel was not to be seen. I thought Maruchi had a feeling that something was in the air, but he would ask no questions until we volunteered some information. He noted that we had been left to ourselves since our meeting with Narga, but said nothing.

In the afternoon Orlon and I went out. I led him first towards the place where the machine was kept. I told him, 'We must not go straight to the wood. We shall go out as if for a walk and enter the wood from the other end.'

We saw Jomel standing under a tree near the central entrance of the monastery, but he made no attempt to follow us as we turned our steps towards the open fields.

'That man has no interest in us at present,' I said, 'and he cannot follow without being seen. He wants to find out whether there is anything unusual between any one of us and an inmate of the monastery.'

'Do you think he suspects anything about Narga and myself ?'

'How can he ? He has seen nothing, but he definitely suspects you, because you went out alone last evening and I prevented him from following you. No, I don't think he has any suspicions about Narga, for in spite of her great beauty, she is believed to be above all human weaknesses. My own idea is that Jomel believes you went to meet one of the nuns or novices secretly, for if you had gone to meet a man I would not have stood in that man's way when he tried to follow you. If he can find out anything there will be a terrible hubbub and Jomel will have the time of his life.'

Orlon rapped out, 'My fingers are itching to get round his throat.'

'Leave him to me,' I said, and we proceeded to walk on till we were out of sight and then turned round to enter the wood at a point away from the entrance that led from the monastery. Arriving at the open space where we had first landed on the morning that we had reached Mars I drew Orlon beneath a large tree that stood on one side, took out the instrument from my pocket and looked through it in the direction of the monastery. Presently, I saw Narga coming out and walking in her queenly way towards the wood, looking neither to right nor to left, nor once glancing behind her. And then I saw Jomel lurking in the distance behind her, moving from tree to tree seeking cover and looking behind him to see if he was being followed in his turn.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

I handed the glass to Orlon who saw what I had seen and ground his teeth in anger. I said, 'Don't look like that when we meet Narga. Trust me to run Master Reynard Jomel to earth. We shall both meet Narga as if by accident and you must be careful to greet Narga respectfully like myself and not to kindle the love-light in your eyes. Don't let your eyes rove about in search of Jomel and behave as if we are not being shadowed by any one.'

Orlon readily promised implicit compliance with my instructions. Through the glass I saw Narga entering the wood and Jomel, who had drawn nearer to her, flitting from cover to cover like a shadow. Orlon and myself were walking slowly, for I wanted that we should meet Narga at a spot where there was plenty of cover so that the spy could hide himself and overhear the first part of our conversation. Having selected such a place we halted and a moment later Narga appeared, moving towards us with matchless grace, her long robe clinging to her graceful figure. As she approached us we bowed low to her with deep respect and I opened the conversation.

'This is a delightful surprise and a great honour, Lady Narga,' I said.

Women are quick-witted but Narga was quicker than most. We had met by appointment but from my words Narga understood that we should behave as if we had met by accident. She replied smilingly, 'I am pleased to meet you. I come here some time of an afternoon.'

I started talking of our visit to the White City and led the way to the open space where no one could follow us unseen and where we were out of earshot of any eavesdropper. Then lowering my voice I told Narga that she had been followed by Jomel who was even then hiding in the shrubbery.

'How do you know?' asked Narga in surprise.

I told her of the instrument I had with me and Orlon added that he also had seen Jomel following her.

'What do you propose doing?' asked Narga.

'I shall catch him now in your presence, but we cannot do him any violence, nor can we prevent him from carrying any tale he pleases to Karos and the others.'

Orlon said, 'The matter rests in your hands now, Narga. We are accustomed to danger, though I do not wish my friends to be exposed to any risk on my account.'

She looked at me. 'Sahir, my friend, what am I to do? You know all. My heart is no longer my own. How am I to choose between the man I love and my place here? I am no longer fit to be the priestess here.'

'Narga', I spoke with decision, 'you must come with us. Once Jomel gets at Karos and the other monks you will lose all your power over them. They will not only try to kill us but may do you an injury. It is not, however, on the ground of fear that I appeal to you. Be guided by the inclination of your heart.'

'So be it. But you must keep Jomel's mouth closed for this one night. Tomorrow let him make up any tale he likes, for tomorrow I shall go away with you.'

'Very well. Tonight we shall take care of Jomel. We shall put the fear of instant death into him if he dares to speak so much as a word against you or any one of us. You put your clothes and other things together so that we may leave early tomorrow morning.'

'I shall be ready,' said Narga and then she and Orlon exchanged a long, clinging look, and we strolled slowly back to the shaded path in the wood, in the vicinity of which Jomel lay crouched and concealed.

A single glance through the glass showed me where Jomel was hiding behind a bush. I stepped up to the place and caught him by the scruff of the neck. I lifted him to his feet and whispered fiercely in his ear, 'Raise a single cry and you are a dead man.' I shifted my hand from the neck to the throat and squeezed it till he was red in the face and his eyes bulged out. Then I relaxed my hold without withdrawing it while with the other hand I grasped him firmly by the arm and dragged him in front of Narga and Orlon.

Narga looked at him contemptuously but spoke no word. Orlon's eyes blazed in fierce wrath, but he controlled himself and spoke in an even voice. 'Well, my friend, your curiosity is rather unhealthy and may make you ill.'

I propelled Jomel in the direction from which we had entered the wood. A turn in the path hid Narga and Orlon from our eyes, but a few moments later Orlon overtook us with long swift strides, and asked me, 'What do you propose doing with this viper?'

'We must take great care of him tonight and must not trust him out of our sight for a moment. Tomorrow we shall cease to have any interest in him.'

'Karos and the other fellows may want to take him away with them.'

'No fear. Jomel is too good a friend to leave us.'

I explained to Jomel in a few terse sentences that so long as he obeyed us he would be quite safe. He was going to take his evening meal with us and to keep us company for part of the night after which he would be free. But if he tried to escape or to communicate with the monks we would kill him at once. I twisted his arm to emphasize my statement.

Jomel was livid with fear. He was as limp as a bundle of rags in my hands and as passive. He professed he had meant no harm and repeatedly promised to obey us implicitly.

When we came near the building in which the airship was kept I let go my hold of Jomel's arm and linked my arm with his as if we were

CC-0. In Public Domain. Panini Kanya Maha Vidyalaya Collection.

very intimate friends. Maruchi, Nabor and Ganimet were all there. They stared hard at Jomel, but I briefly explained everything. When I said that Narga and Orlon loved each other and Narga would leave with us the next morning the astonishment and the excitement were unbounded.

Maruchi warmly shook hands with Orlon. 'I dreamed of such a union,' he exclaimed enthusiastically, 'and Sahir told me you loved Narga, but I was doubtful whether there was any place for love in her heart. Praise be to Raba that my dream has materialized! Not all the monks and spies in Mars can keep Narga when she has made up her mind to go with us.'

Orlon shook hands with Nabor and Ganimet. Jomel was bewildered by the sight of all this exuberance of spirits, but when Ganimet with his eyes rolling horribly and his large and unhandsome face distorted with real or feigned passion lurched towards Jomel with his huge hands clawing the air the spy let out a squeal of terror and clung to me, trembling violently.

I laughed and pushed Ganimet away.

'No manhandling,' I said, 'besides, Jomel here is my particular friend,' and I patted the shivering spy reassuringly on the back.

Ganimet made a grimace of disappointment 'I wish we were back to the good old times when spies were summarily hanged and shot. I feel I could stretch this rascal's neck with my bare hands without the slightest compunction.'

XLII

We had to be very careful about the man Jomel. If he were to slip through our hands before we were ready to leave it might lead to grave complications and perhaps to a ghastly tragedy. At the same time we could not think of laying violent hands upon him, for apart from our own disinclination to do so there were Karos and the others to be reckoned with and we had to do all we could to avoid a conflct with them. Nothing less than the fear of instant and sudden death would prevent Jomel from attempting treachery and this fear I put into him as we proceeded towards our quarters. Outwardly, we appeared to be great friends, for I walked with Jomel arm in arm while the rest of us had taken up strategic positions which effectively prevented all chances of escape. I was engaged in persuading Jomel that even if any one asked him to leave us that evening he should refuse to do so on the ground that he was very happy with us. My persuasion was punctuated with gentle hints as to what would happen if he were so disobliging as to attempt to part company with us. I looked at him with murderous eyes as I said, 'Make the slightest movement and the next moment you will be dead before any one can stir a finger to save you. And you must laugh and look quite happy while you are with us. You must not look like a frightened rabbit. Laugh now and let us see how you do it.'

Jomel laughed. It was a horrid cackle while his lips and face formed into a hideous grin.

Orlon clapped him on the back so vigorously that he winced and wilted. 'Never mind about laughing,' cried Orlon, 'you wear the winsome smile.'

And Jomel smiled. It was nearly as bright as the laugh.

In our own rooms we made a careful disposition of our forces. We made Jomel sit with his back to the wall while we sat close to him in a semi-circle so that we could easily reach him by putting forth our hands. When a man came in with our food we told him to bring Jomel's share also and he did so at once.

We had just begun to take our food when Karos and another monk came in. Karos looked surprised and said, 'Jomel, where have you been all the evening? I thought you were coming to take your meal with us.'

Jomel looked at us and we looked at him. Our looks were not at all menacing but they were very eloquent. Jomel said, 'I have been with your distinguished guests here. They have been very kind to me.'

Maruchi said, 'Our friend here has travelled a great deal and we find his conversation very entertaining. Let him spend this evening with us since we shall be leaving very soon.'

'You heard what the Lady Narga said,' rejoined Karos. 'She holds confidential conversations with you and she will detain you here.'

'We have been away from our own world for quite a long time and we hope to have Lady Narga's permission to depart. If it has pleased her to converse with us in confidence on high subjects we feel very highly honoured. The great Master Ashan favoured us with his confidence and what he told us was intended for the Lady Narga's ears alone.'

'You are very fortunate. Even the Lady Narga takes your part against us.'

It was no part of our plot to precipitate a misunderstanding or a quarrel with the monks. Maruchi spoke with the adroit tact that never failed him. 'Hardly that, Karos. The Lady Narga had to be careful like ourselves. You are wise and we have been fortunate in meeting you and the other holy men here.'

This soft answer had the desired effect and Karos and his companion withdrew.

We sat up late that night talking over our plans for the next morning. We did not mind Jomel's presence as he could not understand our language and we avoided mentioning Narga by name. Orlon went out for a short while and when he returned Nabor and Gaminet went to the place where the airship was kept. They had instructions to take out the machine towards the end of the night and to be ready to leave the instant Narga and we boarded the ship.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

About midnight Orlon and myself took Jomel to his room and tied and gagged him securely so that he could neither move nor cry out. We did not want him to witness our departure or to know when we left. We closed the door of his room from outside. Returning to our own rooms we put on our own clothes and laid aside those that the monks had given us. Some of these clothes were on board the airship. We had nothing to carry for Nabor and Ganimet had taken away everything belonging to us. Orlon told us that he had gone out to take from Narga a large bag containing her clothes, and he had put it away in a locker in our airship. She had also told him that she would come out very early before any one else was up and that we should await her half way between the monastery and the airship.

For Orlon there was no sleep that night. Maruchi slept a little while I had a few short snatches of uneasy sleep. Half an hour before dawn Orlon awoke Maruchi and myself by touching us gently, and we came out of our rooms and listened for any sound from Jomel's room or any other part of the building. There was stillness everywhere and we silently passed out into the open. Orlon ran swiftly with noiseless feet to assure himself that Nabor and Ganimet were ready at their post, and he returned and whispered that everything was right. We then looked anxiously towards the door that led to the apartments of Narga.

There was a cool breath of the coming morning in the air. The light of the stars was paling and not many were visible. Our own planet was fading in the growing light and in the east the grey of the dawn was dispelling the blackness of the night.

As we strained our eyes in the direction from which we expected Narga to appear we heard a frightful uproar near the rooms we had occupied and knew at once that Jomel had been discovered and his tale had been told. The next inst... two doors in two parts of the building w... flung open. From the first issued Narga wit... startled look in her eyes, and from the oth... emerged the monks with Karos at their head a... Jomel well behind the rest. Narga cast o... glance at them and then she ran like the wi... urging us with her right hand to hurry back ... the airship. The monks were furious and w... shouting death to us all. Their object was to g... between us and the ship and prevent us fr... boarding it. But they were not young, they w... big and heavy men and they were too close ... one another to be able to run fast.

Orlon made a movement of going towar... Narga but Maruchi seized him firmly and as ... ran to the ship he said, 'The monks could k... us by merely holding us. Narga herself wa... us to reach the machine. She is quite safe.'

The monks were still at some distance wh... we ran up to the machine. Maruchi and ... clambered in at once but Orlon insisted ... waiting for Narga.

Seeing that we had given them the slip t... monks turned to intercept Narga. They spre... out with the intention of barring her way to t... airship, though they merely thought that s... wanted to save us from their fury and had ... suspicion that she intended to join our flig... They might as well have tried to catch a bi... flying through the air. Narga was out throu... them like a flash and the moment she was with... reach Orlon caught her in his outspread arm... and swung her on to the machine and sprang ... after her. There came a horrified gasp and ... smothered yell from the monks. Nabor turn... on the switch charging the protecting wires rou... the machine with the electric current and Kar... and the monks who tried to lay hold of t... machine were thrown back staggering a... reeling, the machine ran a short distance a... rose swiftly into the air.

(To be continued.)

THE PROBLEM OF PSYCHO-PHYSICS IN WESTERN AND EASTERN THINKING

By KURT F. LEIDECKER

THE relation of the psychical to the physical has been one of the vexing problems in Western philosophy and, like every problem in metaphysics, has not been settled. The reason is very patent. The solution of philosophical questions depends entirely upon the attitude which a person assumes. No consensus of opinion, however, would be possible were it not for the fact that the great variety of attitudes which people take towards life, can be reduced to a few types which are very clear-cut and distinct from each other. Conclusions follow logically from certain assumptions, and, likewise, a person's behaviour and habit of thinking flows logically from his attitude.

It is possible to take two fundamental attitudes toward the problem of psycho-physical relationships. One is to acknowledge its reality, the other is to deny it. In the first case it is a matter of inclination whether we believe merely in a parallelism between the psychical and the physical, or in the existence of a definite influence of the physical on the psychical or *vice versa*. Belief in the impossibility of any relationship whatever by no means implies disbelief in the spiritual. It may indicate that the person has no faith in the existence of the spiritual, everything being physical and material ; but it also may mean that the person interprets nature spiritually only. Each of these views—and there are many gradations arising from the greater or lesser power one is willing to allow either the physical or the psychical—may be defended rationally and to complete satisfaction. The only question is whether we are willing to accept the premises.

Let us see briefly which views the West has favoured on a whole, before we discuss the Eastern view on the subject. The exponents of a strict parallelism really fail to see the problem. They keep the physical—by which we understand here always the material and the purely physiological and biological—absolutely in isolation, as they do the psychical—by which we here understand the spiritual, the mental and the conscious in general. There can be as little relation or communication between the two as there can be between a thing and its image in the mirror, provided we do not invoke the aid of a miracle which, though permissible, is yet neither scientific nor philosophic. We characterize this doctrine as dualism in its uncompromising form. In its milder form, dualism accepts physical and psychical reality in their distinctive qualities, but endows them with properties producing reactions in the other. Sometimes it is the physical which stimulates and encroaches on the psychical, at other times the psychical determines changes in the physical. Such a view is tenable but has to face many difficulties which monism attempts to correct. If both the physical and the psychical are capable of interacting, then both must share certain qualities and their nature cannot differ very much. Thus, why not allow only the physical or the psychical ? The various manifestations may then be considered modes of one being. A religious person, or one believing in the supremacy of the spiritual, would, in taking this step, fear to be thrown together with rank materialists. Scientists, on the other hand, are apt to reduce spiritual to physical reality, and should they not be willing to do so they would lay themselves bare to the charge of inconsistency.

In the treatment of the psycho-physical problem it has always been the tendency of Western thinkers not only to accept certain traditional views, but to make the constitution of the individual the writ large of the universe. To talk of body-mind or mind-body does not alter the situation very much ; it simply evades the issue. Philosophic thought in the East, whose cradle has been India, approaches the question under consideration differently. The

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

general premise of all Western speculators about the psycho-physical is that thought is completely other than the reality about us. They artificially separate the contents of consciousness and hypostatize certain elements. Mind and soul is known only from what they are about, yet they are set up as separate entities in a complex world. Likewise, tangible matter is known only in those qualities which affect our mental and psychological apparatus, yet it is treated as a foreign substance. The correctness of these premises as we hinted in the beginning depends on our attitude. Strictly, they can neither be proven nor disproven. All we can say is that they lead us on to conclusions which are not wholly acceptable either to the scientist or a religious consciousness.

Let us see in what light the psycho-physical problem appears in Hindu philosophy. As we cannot go into a detailed discussion of intricacies of language and thought we must rest content with a summary picture and an abstract, as it were, from the Hindu outlook on life.

When we reflect on life and the universe we make use of what the Germans call a certain *Einstellung*, that is, we turn away from our habits of doing, the ordinary routine of everyday existence, that is, as we commonly say, we stop and think. This is a most significant act, for immediately the world assumes a novel aspect. We become aware that this world in which we acted and were acted upon a while ago is, to speak with Schopenhauer, our idea. It is all content of our consciousness. Mind and the "psychical" are the necessary conditions of our experience and whatever is is merely our experience. The importance of this insight for the mind-body problem consists in that we cannot talk about a physical *influencing* a psychical or a psychical *influencing* a physical, but that the psychical is to the physical like the tree to the leaf. The existence of the tree is the necessary condition of a particu ar leaf. The existence of the tree does not cause the leaf, but is necessarily, or from principle, or *a priori* contained in the concept of the leaf. And thus the whole universe in Hindu thinking is not an interaction of physical and psychical reality, but one mighty manifestation of consciousness.

What practical consequences arise f such a view and how are the phenomena wh are explained on the basis of a psycho-phys relationship to be evaluated in this theory ?

In the first place we must rid ourselves the generally accepted, though somew antiquated, idea of a pantheism underlying Hindu world image. That any partic thing or any collection of things is God is best very unphilosophical and Hindu spec tion cannot be charged with that. The daring step which ancient Indian philosoph took was to identify the essence of the hu with that of the universe in the fam Upanishad phrase *tat tvamasi*, That art t Not this limited complex of feeling quali called the body, nor that complex of thoug and ideas called the mind is supposed be identical with the world ; but the of man, *atman*, is the same as the Self or S of the universe. In other words, the necess *a priori* background of this my indivi experience is the same as that which forms logical substratum of the universe, call it if you like. Not, as some mystics have that the human soul is a spark of the div the self within each man coincides, as it with the fond and font of the All.

This identity has, indeed, been discov also by idealists in the West in their theo of knowledge. But the East has never b satisfied with this intellectual discovery. went farther than that and asserted that identity must be made an object of experie The only way is full realization of the in of this metaphysical truth. Herein lies happiness and bliss, *ananda*, which every H sage wishes to attain. It also supplies basis of all morality. Not only is a truly h person good by nature, but the realizatio oneness with all can lead to no evil de thought.

Although, generally, Hindu philosop defined the ultimate reality in impersonal as *That, It, This, this world all*, an like as an object of reverence and wo a personal relation was bound to be u most in the minds of devotees. Reli enthusiasm and inspiration are always fervid if the object of piety is conceiv having some characters that are akin to kind. In prayer too, it is in the nat

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

language to lapse into a personal attitude. But it must be said that the Hindus generally do not pray in the sense of asking a favour or making a petition. Their prayer is rather a meditation, a collecting oneself, which has the significance of putting oneself in closer touch with the metaphysical world-ground.

If we enquire finally what benefits are to be derived from this particular Hindu attitude, we get a different picture from that usually drawn of Hindus. Pessimism is in order for those only, who see no escape from the round of rebirths, *samsara*. Salvation lies in the vital realization of the unity of all, as described above. Since, however, not all are philosophers, they cannot fully comprehend the meaning of the metaphysical solution and their unhappiness has always been taken as typical of Hindu life and religion. The Vedantin, on the contrary, presents the picture of contentment, for he ever keeps the object of his realization in view. He need not, like the Yogin, take recourse to physical means in order to get in touch with the highest reality, as he carries it deep within himself.

And here we should point out the implications which the theories of re-incarnation and *karman* have as far as the problem of the psycho-physical organism is concerned. The logicalness of the Hindu who is unafraid to draw the ultimate conclusion and to accept it at its full value becomes apparent when we take into account the following.

Those who consider the round of rebirths, *samsara*, as practically stopping only at the world end to begin again in the next *Kalpa*, submit to their fate quietly and without complaint. To uphold their belief they must postulate a soul-entity—the psychical mechanism of the Western world—and a corporeal entity which is the body, with this difference that in the Hindu concept of body is included a finally assorted mass of material elements, starting with the tangible elements constituting the body proper and ending with an ethereal substance representing the mind-stuff. The same laws which govern the physical world hold good in all classes of "matter." Action and reaction, cause and effect, stimulus and response are inviolable behaviours in these realms, and the totality of such forces is called *karman, i.e.*, action. This action may be good or evil, leading to a pleasant or an unpleasant future life. It is to be noted that thought falls under the same category, producing good or evil *karman*. In as much as it is the nature of living bodies to react and to act spontaneously, *karman* is inevitably accumulated, and the only hope of a person consists in diminishing his pile of evil *karman* and building up more and more good *karman* around the nucleus of his self or *atman*.

This is a consistent doctrine. It avoids all those dangerous rocks before which the Western thinkers halted, faltered or turned back. It is ruthless in its consistency, but at the same time, or, rather, because of its relentlessness, it is blind. Hence that mightiest of all human struggles—equalled by the medieval cry for salvation from original sin—the struggle to get out of the round of rebirths, to be released and to attain peace and everlasting happiness. And India *did* find the solution in the sublimest of all truths that the individual self is identical with the All, that *atman* equals *brahman*, and that in knowledge or realization, *vidya*, salvation is to be found.

A TRILOGY OF PARADOXES

By FRANK C. BANCROFT, Jr.

AMONG Europeans who have become "seasoned" by a considerable residence in this country, the common assumption is that Indian temperament is at bottom paradoxical and therefore beyond ordinary human comprehension. If the personal reference may be pardoned, this is a matter of considerable interest to myself, for in it lies the influence which has kept me here much longer than I had originally intended and which largely occupies my attention as I make ready to depart. This matter of paradox deserves attention, for it is more complicated than we generally assume. Often what we regard as paradoxes are mere superficial disparities which tend to dissolve themselves as we learn more of the real meaning below. Again, more significantly, sometimes the so-called paradox is a *bona fide* conflict, *i. e.*, apparently paradoxical conduct results from the fact that an individual-in-society is a complex affair and that the forces which impinge upon him at one time lead him to feel, think, speak and act in one way, and later in a different. However much experience and patient analysis correct understanding of such a situation may demand of us, there is nothing mysterious or occult about it; once we realize the nature, the intensity, the complexity and frequency of these currents, the conduct becomes natural enough. Indeed, in this sense human nature is paradoxical in varying degrees the world over.

But there is a set of facts which tend to make Indian temperament perhaps a shade more paradoxical than most. After a brief examination of them, we shall proceed to the task of attempting to unravel three of the paradoxes which most commonly confuse the minds of those foreigners who are interested in understanding the people among whom they live. Even in settled conditions of culture there is always a certain amount of perennial conflict between the desires and interests of the individual and folkways and inhibitions of his group. Indeed it is these which have provided the skeletons of ninety-per cent of European novels and dramas f the origins of those literary forms to present day. It is always interesting watch the reactions of people who have b told that they may not have something wi they very much want, or that they m accept something for which they have sli inclination.

This normal conflict is drastically accentu ed in India today by two principal fa In the first place her entire national h beginning at the top and percolating down the very bottom, is coerced by a politi a cultural, an economic, a religious an social pressure from without. In other wor that very agency which usually repres stability elsewhere—that is to say, the lar corporate entity, society—here is a source conflict of the most violent nature. It but natural that when the stabilizer its runs on a loose pulley its component pa will not tend to manifest a high degree stability. It requires a stretch of the imagi tion to grasp the second fact, for it is stridently at variance with this one. It simply this: That Indian society is, by nat extremely conservative. Now we are com somewhat closer to the central source of this paradox. Do you not see that i characteristically close-knit and static so organism is called upon to live in continu change and in continuous conflict with anot of an entirely disparate order, that it bound, in the very nature of the case, produce paradoxical individuals? If centripetal and the centrifugal forces alw operated with the same intensity, a remarka stability would of course be produced. they do not. Let us take an instance. centrifugal forces begin to operate in mature Indian girl undergraduate. She been reading Keats, Shelley, Swinburne Browning. She has visited an occasio Occidental cinema. She has met one or sophisticated companions of her broth

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Circumstances so conspire that she thinks nd says a number of things which are onsiderably eccentric to the customarily rescribed behaviour of her sex, caste and lass. As long as these forces have relatively ree play, she is a tolerably unified individual. t suddenly the centripetal ones begin to nction. Perhaps they come in the shape of onscience (*i. e.*, social memory); perhaps in at of a severe fraternal or paternal primand; perhaps in that of fear of tection and social boycott. Inwardly and twardly she changes. But there is nothing rticularly paradoxical about it. Ordinary uman beings, Indians or otherwise, men or omen, placed in similar circumstances, act in this fashion. Thus to an examination several general classes of confusing conduct India.

I

Organizing Ability

Europeans (and not infrequently Indians emselves) are often taken aback by the ct that the latter exhibit a lamentable k of organizing power. Among all peoples, y say, those of this country should el in this respect, for their family and cial life is perhaps the best disciplined in the rld. In an Indian household there is not slightest doubt about who wields supreme thority nor about the exact relationship ich exists between every member and all others. Each has his duties and rogatives and is quickly called back into if he transgresses or falls short. So in the ger social groups; each caste, each class, ch profession is strictly docketted and machine runs like clockwork. Such condition would seem to provide the al background for the efficient functioning voluntary organizations, such as the ngress, agencies of social service, nicipal bodies, educational institutions, etc. that is necessary is that the members nsfer to the leaders and to their colleagues same attitudes and the same sense of thority and discipline which they habitually bit in regard to their parents, wives, sbands, sisters and brothers. But what do see? Hardly a voluntary organization ny kind in India which is not perpetually split asunder by schisms, factions and disintegrations. Whence the paradox?

There are two principal sources, one external and one internal and both comparable to the fact that an unused member tends to atrophy. Ordinary Indians have not had the opportunity to order their own corporate affairs literally for centuries. From the feudal stage (which was a world-phenomenon and which produced the general irresponsibility which forms the principal problem of democracy to this day) they passed under first, the Muslim domination and then the British. It has become part of their very nature to look up for orders rather than in and out for corporate plans. That particular function of the human personality which enters into voluntary and sustained corporate enterprise has lain dormant so long that it can scarcely be wakened in a tryce. Collateral with this is the internal fact. The traditional Hindu family is a benevolent despotism in which each member performs certain duties but in which he seldom has to exercise the disciplined initiative which is the heart of voluntary corporate enterprise. During his youth he does what he is told; in his maturity he does the telling and others obey. Between these two periods there is nothing.

The educated young man who is expected to share in voluntary enterprise today is egregiously badly prepared for it. During his boyhood and young manhood he has alternated between two despotic milieux; that of his paternistically geared home and that of his bureaucratic school and college. I cannot quite express the surprise which came to me when I became aware of the juvenile disciplines under which college students live in Calcutta. Two agencies and not one are responsible for it. On the one hand, Government does not trust these young men because they are potential terrorists and trouble-makers; and on the other hand, their parents and guardians do not trust them, because they may fall into evil ways. Between the two the youth has not the ghost of a chance of developing into the kind of man who can corporately bear responsibilities with equals and who can make a disciplined inferior and a reasonable superior. Human nature is like a jack-in-the-box. Once the overhead pressure has been removed, we see before us

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the very embodiment of self-asserting arrogance—or a supine willingness once more to be "squshed" down into the little compartment.

II

Regarding the Physical

Before coming to India it was my impression that the tendency to separate the spiritual and the physical into sharp dichotomy is a Hebrew trick and that in India I would find a more penetrating realization of their interrelation. Certainly the expectation cannot be considered entirely without foundation. It has become a truism to remark that India's traditional and characteristic contribution to the world of thought is that all things are One. The final word of India in the metaphysical realm is monism, pure or qualified. And that of the Hebrew-Christian tradition is dualism, sharp or mystically softened. The latter had failed to satisfy me and I hoped to find a vital interpretation of the former in the life of contemporary India. How pitiably naive—to expect unity of life in the India whom history, internal and external, has torn to bits ! At any rate, such was my hope ; but what did I find ? I have never known any people in whose minds and actions there exists a more categorical disjunction of spiritual and physical than my Indian friends of the moment. The very word "physical" has become an accepted adjective of contempt and aspersion and everything pertaining to the physical life of man is regarded as inimical to his spiritual development. And yet, when this troubled life of psycho-physical conflict is terminated, the corpse is escorted to the burning-ghat by the cry "Hari Om."

How is it that India has so conspicuously relinquished her birthright ? Have I fallen into some grave error of insight when I presume that the fruits of monism should be not asceticism, but a sacramental attitude which conceives the physical as a medium of expression for spiritual values ? It cannot fairly be answered that such a spirit as I describe pertains to the India of a century ago, but not to today. Is not the ascetic Mahatmaji still m..e to the liking of the people than the Greek Rabindranath ? Insuperably great as he is as a political a social prophet, when it comes to the in psyche and the normal life of the individ Gandhiji is of the flesh-and-bone of Sim Stylites and Savanarola. Such a disposit is what is commonly accepted as "holy" the India of today. Before the turtle-s can find light, it must pull in the head limbs, representing the five senses. The se are not servants helping the individual in pilgrimage, but traitors leading him inevit into the nether abyss.

This paradox is considerably more diffi to resolve than the previous one ; ind it is something of a real paradox. But must attempt to scale its battlem

In the first place, it must be remembe that in all lands the philosophy of enlightened ones and the psychology of common people do not at all points coin It is extremely doubtful that the ordinary of Indian men and women ever unders let alone vitally adopted, any form of mon Early they came to realize that undiscipl sense expression led to a deterioration spiritual life, so they broke their world into two inimical halves and called the heaven and the other hell. In the realm sex, hell became permissible only marriage, when it somehow got itself t muted into a kind of heaven. This w little hard to understand, but the priests it was so, so it must be. It is a tempti easy solution of the moral problem to hang placard "bad" over the physical and "g over the so-called spiritual and let it that. Everyone can perceive the diffe (or thinks he can).

But even among the thoughtful m themselves, there was at work a dialectic was inevitably tending toward asce True it is, they said, that all things bottom spiritual, and that, *rightly unde and properly controlled* the physical be the medium of the spiritual. But usually inhibits us from a full underst and enjoyment of this fact ? It is imp and undisciplined sense-expression. The the senses have to be *converted* to their use and this can be done only thro rigorous and prolonged course of Therefore in their naive and raw co

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the senses are inimical to spiritual realization. Hence *yoga* and asceticism.

Unfortunately, human beings usually forget the point during the process and somewhere along the line apotheosize the subsidiary technique, losing sight of the goal. This is probably what happened in India. Undoubtedly the early conception of holiness was wholeness, a unified life in which the physical, mental and spiritual worked spontaneously and organically. To this end, discipline was necessary. But, on the way, holiness was transferred to the discipline itself and the "holy man" became the one who lashed, starved, and lacerated his body into subservience. Alas! While "brother ass" was being whipped into harness the sweet meaning of life had scampered off into the woods of oblivion.

But the worst has not been said. If Indians as a whole had been willing and able scrupulously to follow the implications of this philosophy—*i.e.*, if the people had turned wholesale into one hundred per cent ascetics, *yogis*, *sannyasis* and *brahmacharis*, there would have soon been a wholesome reaction which would have blown the lid sky-high. But they were not so easily to be trapped. They evolved a professional clique of scapegoats (at Benares and elsewhere) and commended themselves to a permanent blame-complex. These, they said, were the ideals of human life. They were "holy men." But, for themselves, it was necessary, for the work of the world, that there should be "worldly men." Thus, no doubt unconsciously, the problem of the good life was flubbed. And the paradox of India's present attitude toward the physical life is that she still groans under this unhappy legacy.

III

Precarious Romance

Lastly, let us look at an interesting and allied paradox, *i.e.*, the condition of romance in India today. This also considerably confused me in my early residence here. I went to live with college students and, as far as I could perceive, their lives were entirely devoid of this element which plays so important a part in that of their contemporaries in Europe and America. Theirs, in short, was a womanless existence, a situation with which I quickly came to sympathize! As usual, my first reaction was naive. Had I not been told that East and West were poles asunder? Here it seemed, were young men who were not young men in the sense I had previously understood—beings peculiarly interested in young women. No doubt their studies, athletics, pecuniary worries, and politics completely filled their minds and spirits. In the beginning, from time to time, I vaguely wondered whether it was not India which I had always considered a country of romance, but at length I began to conclude that this had no doubt been false testimony of the order of "Mother India," "Uncle Sham," etc. I stoically resolved to adjust my thinking to the facts.

But then, gradually, I began to detect in my companions a suspicious proclivity to read lyric poetry and to creep clandestinely into the more erotic Western films. Furthermore, when the formality wore off, I became aware that at times their conversation sought levels different from those of metaphysics and politics. Again, the pictures in their rooms were not all of Bhagat Singh (I was in Lahore) and the Taj. Most inconsiderate of them—to force me into another mental adjustment. Then I began to inquire whether romance had really always been contraband in India. Had the moon, the fields, and the rivers always been of purely astronomical, botanical and geological interest? Little by little I was acquainted with the fact that in North India there was to this day a predilection for the more erotic of the Persian poets and that in Bengal there had been certain Vaishnav versifiers of similar stamp. And *then* I received primary introduction into the metaphysics of Radha and Krishna. Tagore, of course, was to be interpreted purely metaphysically. I wondered. . . .

Now, I am sorry to say, the cat is out of the bag. It happens to be a fact that not only are Indian young men young men, but Indian young women bear close resemblance to young women! The only difference is that they have more difficulty in actualizing it. Such is social obedience in India that the older generation is not even aware of what is going on inside the hearts and minds of their sons and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

daughters today. With the exception of a slowly increasing number of clandestine departures, external relations go on today much as before. But the tide is rising and one day, not in the very distant future, romance will once more come into its own in India. It is in the mind and blood of the people and murder will out. It is already "outing" more than nine-tenths of the population realize. But the price is often cruel and the percentage of broken hearts is sadistically high. There is some consolation in the fact, however, that this curve will decrease as its cause increases. This is the positive side of the law of diminishing returns.

Thus this paradox resolves itself comparatively simply. Superficially one wonders how it can be possible that a people uniquely rich in romantic imagination can be almost completely starved of it in experiment. In the first place, the repression itself is no doubt responsible for much of the lyrical exuberance, as is the case in all times and countries. "The sweetest songs are those that tell of saddest thought." Keep a romantic young man severely solitary at ten o'clock on a full-moon night and the odds are that he will write a poem—though not so good a one as if he had done a little preliminary laboratory work. Much of what remains of the paradox is further resolved by realization of the fact that the present constricted social order is not an immemorial one in India. Time was when young men and young women had considerably more prenubial freedom than today. Numerous invasions, and particularly the Mussalman invasion, did much to tighten things up. Sudden and unaccustomed congested living in a place like Calcutta has in recent times increased the difficulty, by making contact more inevitable and more dangerous. It is really not a paradox. It is a socio-historical complex.

An Attitude

No claim is advanced that these "solutions" adequately or even correctly get to the bottom of the three paradoxes dealt with. No doubt continued living and thought in India would produce newer and deeper insights into the nature of them. And even if these three were satisfactory, there remain dozens of others which baffle us foreigners. My only hope is that the assumption and the method are correct. The assumption is that Indian nature is human nature and that the laws which affect it are those which affect the rest of us, however different the particular contemporary and historical facts may be. The method is that of sympathetic effort to understand and suspended judgment. The former presumes a certain social attitude toward one's fellowmen as a whole, and the latter a rather difficult and always bothersome condition of the judgment—*i.e.*, that of stable disequilibrium. Our judgment always wishes to rush into port and to settle down in the haven of accepted attitudes and neat formulae. This permits us to make speeches and write articles, but it does not permit us to go ahead in the vital process of growing in understanding. For what it is worth, I offer this as a fruitful spirit in which foreigners may enter into rapport with Indian people. Of course those who come only to tour, to rule, to convert, or to exploit, will not be interested. Fortunately, these by no means constitute the entire European constituency in India today.

PRINTING IN INDIA TODAY—ITS NATIONAL ASPECT

I. By C. F. ANDREWS

I have kept in my writing case now for nearly a year a remarkable paper which I received from Nitindranath, the grandson of Rabindra Nath Tagore. Before he died, he told me very much about his own ideals and I have embodied these conversations in this paper.

Germany is today in the throes of a great revolution which represents a tremendous reaction on the part of the younger generation against the cruelty and falsehood of Versailles. At the time that this Peace was forcibly imposed upon Germany, I wrote an article in *The Modern Review* (August, 1919) called 'A Peace that is No Peace,' condemning the dishonourable way in which that peace had been made. At the end of that article, which was actually finished on July 9th, shortly after the signing of the peace, I wrote as follows:

"Just as from every corner of the world the cry went up before against the inhumanity of the war methods employed by Germany, which shocked the conscience of mankind, so now from every corner of the world the cry will go up against the inhumanity of these 'peace' methods of the Allies, which, as soon as they are fully known and understood, will shock the conscience of mankind. Inevitably this will come to pass, and the voice of thoughtful men everywhere will be clear and strong."

Unfortunately, the latter part of this sentence did not come true, for very little protest was made at the time, and I was bitterly attacked for writing this article. But very slowly since then the tide has turned and the treachery of the Allies has become more and more openly recognized.

The aftermath of the War told on the German people far more severely than on any other portion of Europe; for in that land, the suffering that had succeeded the War was almost greater in its physical misery than that which occurred during the war itself. We must remember this when we judge the things that are now happening before our eyes in Germany today.

Since the year 1919, I have visited Germany five times in all, and while on each occasion my admiration for the German people has steadily grown greater, there has been mingled with it an ever-increasing sense of a weight of sorrow lying heavily on the land which nothing seems able to remove.

On the last two occasions, my errand has been itself a sad one. This has naturally added to the gloom of the picture which I drew in my own mind. For Nitindranath, the grandson of the Poet, Rabindranath Tagore, had gone to Germany, with high hopes, only a little more than a year ago in order to carry through a great object for his own country whereon he had already set his heart and soul. He was determined to create in India an artistic school of printing, not inferior in any respect to the finest art printing schools in Europe and America.

I have with me a pamphlet beautifully set up in type, which he published in Germany a short time ago.* In this, he explains his whole idea of national printing in India. He tells us how in the year 1561 A. D., the Portugese missionaries brought with them the message of John Gutenberg to the shores of India. His article will, I hope, be published in *The Modern Review* where readers may get for themselves his point of view. Here I only wish to tell, in the simplest way possible, something about this young author and printer, whose last days were passed in Germany which he had learnt to love as his own home. He had suffered quite unexpectedly for some months from a very rapid form of illness which brought to an untimely end his brilliant career.

During the last days of the illness he spoke to me often about the plan he had been preparing for carrying forward more rapidly the handicraft of his own country in this direction. His longing was that the great skill in craftsmanship, which had been inherited in India for more than a hundred generations, should be revived and employed for art printing. Especially he desired that the vernacular scripts of India should have their own fully acknowledged place as works of beauty in the Printer's Art.

A very brief sketch of his career may here be given. After he had gone through his preliminary education at a modern school, called St. Christopher, at Letchworth, near London, the choice was offered him of either continuing his studies in some university, with a literary end in view, or else of taking up some technical course, such as art-printing. He preferred the latter, and after trying various forms of technical work he became more and more enthusiastic about this printing course he had originally chosen.

At first he was sent as an apprentice to the Baptist Mission Press, Calcutta, in order to study from beginning to end the entire process of the production of Indian books in the different vernaculars. This Press is famous for the variety of its different language types. The Rev. H. Knight helped him greatly in this preliminary

Digitized by Arya Samaj Foundation Chennai and eGangotri

work and had a great affection for him. From this work in Calcutta he went on at last to Bombay and through the influence of Sir Stanley Reed was admitted to the Times of India Press. Here he was able to study some of the special colour processes which had been developed in that press in connection with its illustrations.

During this time in Bombay the idea began to take possession of him that he should make a life study of this subject and win for his own country a high place in the artistic printing of the world. After some hesitation, he decided to go to Germany where the best modern art printing work is to be found. He went first of all from Bombay to Berlin, where he had many friends both Indian and European. He stayed at the house of Dr. and Mrs. Mendel, where the Poet, his grandfather, had always been a thrice welcome guest. They are related to the world-famous Dr. Albert Einstein, who used constantly to visit their house.

The greater part of the bitter winter weather was passed in Berlin itself, and it would seem that it was here in this bleak, wintry climate that he contracted a serious weakness in the lungs which led on to his final illness. Before the illness became acute, for the sake of his own printing work he went on from Berlin to Leipzig ; for in that city the greatest publishers in Germany are to be found. In Leipzig, the chest trouble which he had contracted in Berlin rapidly developed. In the end, on March 14th he was striken down by a very serious illness, which made him take to his bed and from which he never recovered. As soon as ever he was able to be removed he was taken to a sanatorium called the Neue Heilanstadt, in the Black Forest, at Schomberg, where he recieved every possible care and attention ; but the disease had already gone too far and after great suffering he passed away on August 7, 1932, at the age of twenty.

While he was in Leipzig, he had taken the greatest interest, even from his bed of sickness, in an international club for foreign students. This occupied every spare moment of his time, and his unselfish service for his fellow-students won their deep regard. They would come to see him all day long, in his illness, and this was his greatest satisfaction and comfort.

In the closing days of his life it was quite remarkable to watch how the idea of the development of fine art printing in India had taken possession of him. Even in his illness, he still looked forward eagerly to its accomplishment. His whole heart was in the cause. There was no thought in his mind of any likelihood of his own early death. Indeed, his one wish was to get well as quickly as possible, in order to carry out the idea on which he had set his heart. During the very last days of his life, he continued to speak of it.

When the end came at last very suddenly, and his earthly life was over, it was deeply touching to those who had watched by his bedside to witness the sympathy of all those who had been with him in his illness. Nurses and doctors alike, as well as the humblest servants, had felt a deep affection for him. He had been so patient and gentle and unselfish in his own suffering, that everyone who came in contact with him realized the noble spirit which inhabited so frail a body. He had a kindly word for each of those who visited him ; and even when he was suffering great pain, he had a smile to cheer those who nursed him. The German people, who have gone through such deep sorrows themselves, had a place in their hearts for him.

The beautiful spot where he was laid to rest was on the brow of a hill overlooking a broad open valley with a pine-forest rising above it. In the far distance of the other side of the valley the pine-forest again stretched out for many miles. It is called in German "Schwarzwald," the "Black Forest". This is a part of Germany most deeply loved by the German people for its beauty and romance. The songs and the legends of the German people are centred in it.

Here in the heart of the "Black Forest" Nitindranath Ganguly was laid to rest. While flowers have been planted over his grave and the wind sweeping through the pine-trees perpetually whispers peace. No more peaceful spot could be imagined and its beauty did much to take away the bitterness of sorrow.

The remarkable project of the grandson of the Poet now remains unaccomplished. It is true that we have already fine art printing in India, but it has not yet reached that superlative excellence which would make it able to compete on equal terms with the finest art-printing of the West.

Skill of hand in designing is probably superior in India to anything which the West can offer. But the extraordinary technical facilities of the West, with its infinite mechanical fertility, have placed Europe in an almost unassailable position. It remains to be seen whether some other young Indian craftsman is able to take up the task which Nitindranath tried to accomplish. His very death, with its pathetic story, may possibly inspire someone or other of his compeers to undertake this adventure.

I have obtained a copy of his paper, which was published in German as well as English and give for the readers of *The Modern Review* the English translation below.

II. By NITINDRANATH GANGULY

IN 1561 A.D., the Portuguese Missionaries brought with them the message of John Gutenberg of Mainz, to the shores of Portuguese India. History tells us that they were the first to introduce printing from "movable types" into India —and that Gaspar de Leao, the Archbishop

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Goa, printed the first book in that country by this new method in the same year. It is not known yet whether printing from such types existed earlier than 1561, or in other words whether it came from China and the Far East, where printing by means of wooden blocks and "moveable types" were in existence "prior to their appearance or discovery in Europe." However, necessary details are lacking to support this vague theory. These are the meagre historical data.

In India there are two distinct divisions of printing, firstly, the English printing presses under English or European management, and secondly, the Indian presses under Indian management. And it is my object here to deal with the latter, with particular attention to its national aspect.

The printing art originated in Germany, and from there it spread gradually to other European countries, where it soon took the form of a national art. But in India this has not been the case, it is still foreign. The distinctive styles developed by those countries have become so characteristic and representative, that it is even possible for the layman to recognize them at a glance. For instance, "the sober and somewhat formal English and the free bold American styles," and many other features, such as the general get-up and binding which gives to the book a "national expression." The question immediately arises, how can this "national expression" be brought about ?

In the Western countries, facilities are given for obtaining practical training in printing and its allied arts, in schools specially devoted for these purposes, whereas in India there are no such schools where it is possible to undergo the necessary training and course of instructions.

The greatest of all problems which face us today is the want of qualified men and schools of printing where suitable training, both practical and theoretical could be imparted to the poor Indian student of print, under expert supervision and guidance. Until and unless we find the solution to this problem, there can be no progress made and the aspiration of a national printing art or industry will merely be a long distant dream.

It is not possible for the would-be Gutenberg to come to Europe for training as he cannot afford it. There are some who have come to Europe at their own expense—some are Government scholarship holders. It will be doing injustice to the young printer to deny him the opportunity of training himself, by placing a financial obstacle before him. Therefore, by establishing local schools of printing in India this difficulty will be overcome.

The government of India, has founded a scholarship for the study of printing in England. But there are certain conditions which make it inaccessible, as it is awarded to those who know English and have completed a period of apprenticeship in a government printing press.

The object of this scholarship is to give qualified Indians the posts held by Englishmen, such as managers, superintendents and departmental heads.

There is no doubt that many have been attracted by this tempting offer and I am of opinion, that it will be a great pity if trained Indians, instead of helping to build up a national printing art, seek posts in the government printing offices.

The birth of a national printing art can never be expected from the government printing offices, where the work produced, such as official reports, etc. are no typographical masterpieces. Besides the English style is strictly adhered to.

To sum up I can do no better than to quote Warren who says "Men are wanted who will take an interest in printing for its own sake and study it as a means of national self-expression."

There are very few good Indian presses and the best work is only a copy or "as is usually the case, a miserable out-of-date imitation." Here again the question of training arises. The creative mind of the printer can only express itself when he is acquainted with the elementary principles of typography and knows the different styles. This will strengthen his imagination and lead him to create a distinctive style.

Our own ancient art will be a source of inspiration to the future printer and will supply us with new ideas which through the process of "modification" and "elimination" will clothe the future Indian book in a national and in beautiful typographical garment.

In the province of Bengal I have seen some books, neatly printed the pages rich with ornaments, decorations, and bound in an Indian *motif*—altogether a beautiful production, which has proved how the artist can help the printer and how important it is to co-operate with each other. This indeed is a very hopeful sign.

It is, therefore, evident that the main problem is the want of technically qualified men and schools of printing in India today. Amongst other problems mainly are, firstly, the general want of education. Some know English and can read and write it and others the vernacular only. Instructions in future schools of printing could then be in the vernacular. Secondly, the want of money in most Indian presses which sometimes hampers their progress, and lastly the absence of interest in the average worker and the indifferent and unfriendly attitude existing between the employer and the employee, which must change.

The owners and managers can do a great deal for the welfare of their employees by arranging demonstrations, lantern-lectures and activities of this kind which will help to create an interest in the worker in his particular work.

In conclusion, I may point out that it requires hard work and sacrifice to build up a national art which India in time to come, will justly be proud of, as she is of her ancient art and literature.

THE SANATORIUM UNIVERSITAIRE AND THE INTERNATIONAL UNIVERSITY SANATORIUM, LEYSIN, SWITZERLAND

By A. K. MAJUMDAR, M.A.

"I slept and dreamt that life was Beauty,
I woke and found that life was Duty."

TO be with the young is to be young, and to work for the amelioration of the suffering of the sick is to ennoble one's own soul. This two-fold truth is brought home to everyone who visits the great "Sanatorium Universitaire" at Leysin, a small but flourishing village in the Swiss Canton of Vaud, and who spends some time with the young inmates of this institution.

Dr. L. C. Vauthier, M.D.,
Director, Sanatorium Universitaire Suisse and Secretary-General, International University Sanatorium Committee, Leysin (Suisse)

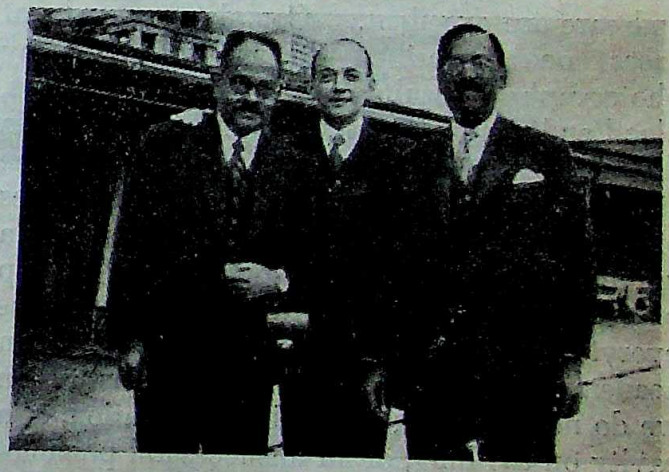
On invitation from Dr. L. C. Vauthier, M.D., the Warden and Direktor of the Sanatorium, my friend, Dr. R. K. Kacker, Superintendent, King Edward Sanatorium, Bhowali, India, and I visited the Sanatorium Universitaire at Leysin-Village on the afternoon of October 12, 1933. We were kindly received by Dr. and Mrs. Vauthier, and were a few minutes later introduced to Miss Agnes Lindahl, a girl student of the University of Copenhagen who speaks German, French and English fluently. She showed us round, explained to us the life of the students residing there, and acted as our interpreter. Since then I have visited the institution many times, passed many happy hours with the University students of Europe here, shared their activities and discussed at great length with Dr. Vauthier the great problems connected with this Sanatorium. It is a unique institution in the world, and therefore deserves to be brought prominently to the notice of the thousands of students who are studying at our Indian Universities, of their parents and of the University authorities in India.

"The Sanatorium Universitaire Suisse," as it is generally called is beautifully situated in the midst of pine forests at an altitude of 4,500 feet above the sea-level. It commands a charming view of the superb Rhone Valley and the snowy faces of the majestic Alps—the Mont Blanc and the Dents du Midi. It is primarily intended for such Swiss University students and teachers of both sexes who are suffering from tuberculosis, whether pulmonary or surgical. The idea of such a sanatorium originated with Dr. Vauthier, who saw that tubercular students residing in Sanatoria, cliniques and pensions all over Switzerland, were not in ideal environments. The hospital atmosphere at most of these places damped their youthful energies and cramped their buoyant spirits. This young doctor's sympathetic nature discovered that two opposite evils surrounded the tubercular patient in those ordinary places of cure, namely, "helpless loneliness on the one hand,

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the deadening weight of unwanted society on the other." Therefore with a view to providing healthy surroundings, an educational atmosphere, facilities for quiet literary and scientific studies, a mixture of freedom and association of young men and women of about the same age, combined with up-to-date medical arrangements to ensure proper treatment, care and rest Dr. and Mrs. Vauthier tried their best to popularize the scheme of a University Sanatorium, and to carry on an extensive propaganda. In every University town special meetings and fêtes were held to explain the idea and collect funds. This was done under the patronage of the Swiss Federal Council, the Red Cross Society and the League of the Prevention of Tuberculosis. The Swiss press strongly supported the project. A Swiss manufacturer gave a handsome donation of 25,000 francs, and the collections at special meetings amounted to about 60,000 francs. The Swiss students all over the little country responded to the appeal splendidly and the scheme was approved by the seven Swiss Universities, the federal School of Technology and the National Union of Students. They gave practical proofs of their sympathy by making it obligatory on all Swiss University professors and students to contribute at the rate of 20 francs and 10 francs a year per head respectively. The University contributions for one term before the actual opening of the Sanatorium brought in about 40,000 francs. The house already standing on the site was rented for a year and some money was spent on its equipment. Afterwards the house was acquired, and additions and alterations were made to make it a suitable sanatorium. The present value of the building is about 400,000 francs. Thus in October 1, 1922, the Sanatorium Universitaire Suisse was opened at Leysin, which had unanimously been chosen by the Committee for the seat of this sanatorium, with 45 beds. While half of the number of beds is reserved for the Swiss University students and professors, it extends its helping hand to the students of all foreign universities, without distinction of colour, caste, creed or nationality. Several Indian students studying in Europe and stricken with tuberculosis have been hospitably received and treated here, for example, Messrs. Reddi, Ahmed and Sekka, whose photographs have been shown to me by Dr. Vauthier. The cost has been kept as low as possible. In considerotion of the regular contributions which were made by the professors and students in "health times"—which by the way are of the nature of premia for insurance against sickness (Tuberculosis)—the professors and students of Swiss universities (even if of foreign nationality) are, during their residence here, required to pay 6.50 francs a day or about 2.16 s. a week each and students and professors coming from other countries have to pay 12 francs a day each. When we remember that this charge includes board, lodging, service, treatment, medicine, X-Ray, and all university facilities, we realize how cheap the arrangement is in an expensive country like Switzerland. Indeed, we are told that the charge is actually below cost.



Dr. R. K. Kacker, Dr. Vauthier and Mr. A. K. Majumdar

This sanatorium is now provided with a modern X-Ray apparatus, a pneumo-thorax apparatus, a dispensing room, a laboratory, an excellent library of 10,000 volumes, a reading hall with more than one hundred and sixty newspapers and magazines of different countries of the world—alas! our country has not so far thought it fit to send any, while Egypt is represented here—old numbers being nicely bound and well arranged, a radio, a microphone, a cinema-projector, an epidiascope, a camera with an enlarging apparatus and a properly equipped "dark room," a lecture hall, a well-furnished small room for tutorial classes,

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

a spacious SOLARIUM for the Sun Cure, and wireless installations at each bedside and on each balcony for transmitting lectures, concerts, etc. to those staying in their rooms upstairs under medical advice.*

Dr. Vauthier was entrusted with the medical, academic and social direction of this Sanatorium. For ten years he worked indefatigably as its physician, surgeon, superintendent, manager, etc. In fact, he was and continues to be the soul of this institution. But the work was too much for one man; therefore he has been relieved of the medical side of the work by the appointment of a resident, qualified doctor, and a part-time head doctor who visits the house twice a week. The expenditure is kept within the income, and effort is made by the managing committee to pay the interest and part of the loan from savings.

The arrangements for the medical examination of the students and for their treatment and care are excellent. Complete records of cases on prescribed forms with X-Ray photographs, results of X-Ray screenings, blood and sputum tests, etc. are maintained in decent covers. The social contact of the students makes them cheerful. The authorities of the institution do not aim at running a university for tubercular students on the top of a mountain; but within the limitations everything possible is done to introduce an academic atmosphere here. At this institution we do not hear talks of a bone operation, of a cavity on the lung, of an unsuccessful pneumothorax operation on account of adhesions, of alcoholization, of phrenic evulsion, of the dreaded thoracoplasty and of a thousand and one talks in the same vein so common at the ordinary sanotaria, cliniques and pensions for tubercular patients. We call this institution a sanatorium, but nobody here talks of sickness. The students enjoy radio music and lectures; they laugh and play and study. * I propose to deal, in a subsequent article, with the need of an Indian University Sanatorium of this type at a suitable hill-station in India. I am convinced as to its feasibility, but it is not possible for me to discuss that question in this article.

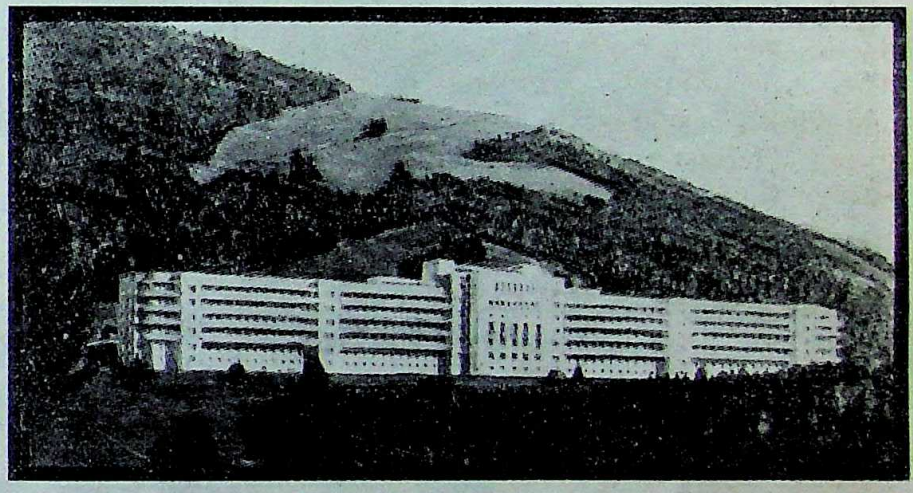
CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

not only by the inmates of the Sanatorium, but also by outsiders. I have had the honour of being invited to more than a dozen of these lectures and I have actually attended five of them.

This will be sufficient to give an idea of the activities of the students of the Sanatorium Universitaire Suisse. Dr. Vautheir is a man of wonderful activity and great power of organization. He works with the energy and enthusiasm of a young man, and is ably assisted by his devoted wife. In the preceding paragraphs I have endeavoured to show what he has done and is doing for the Swiss University students smitten by tuberculosis. But since tuberculosis is a great scourge of civilization, and seizes young men and women in all civilized countries, Dr. Vautheir, the great dreamer and worker as he is, has drawn up a great plan for the establishment of a real International University Santorium at Leysin, in which all the great nations of the world will be asked to co-operate by founding a number of beds for such university students and professors of their countries as may in future be seized by this fell disease. The scheme is by way of an insurance against tuberculosis. It is intended to build a large, thoroughly equipped Sanatorium, containing 208 beds at a total cost of £ 208,000. The Government of each country can have a fixed number of beds reserved at £ 1000 each. A representative Provisional Organizing Committee has been formed for the purpose with Dr. Vautheir as Secretary-General, and detailed plans and estimates have been prepared. The Swiss Federal Government has been pleased to patronize the proposed scheme by deciding to buy 20 beds, although there are 45 beds for Swiss students and professors at the University Sanatorium Suisse. They have already voted 500,000 gold Swiss francs ; the Canton of Vaud has subscribed 50,000 francs Swiss and the Municipality of Leysin has with equal liberality given a large, beautiful site absolutely free. Owing to the unfavourable financial situation in most countries, the Governments of all countries have not yet been approached ; but many Governments have already promised their support. It is intended to approach others soon, and the Government of India will also be requested to participate in this international work. It has the support of the League of Nations and later on all the participating Governments of the world will be its patrons. I am concerned with Indian students. They will ask : "What have we to do with the proposals for the establishment of an International University Sanatorium at far-off Leysin in Switzerland ?" Well, the aim is three-fold :



The Plan of the proposed International University Sanatorium, Leysin (Switzerland)

(*a*) to cure university students and teachers of all countries, who are attacked by tuberculosis ;

(*b*) to enable university students to continue their studies ;

(*c*) to surround them with an atmosphere of university self-help and international co-operation.

There are about 2,000 Indian students studying in Europe and the incidener of tuberculosis among them is believed to be not less than five per year. Such Indian students as during their residence in Europe are attacked by tuberculosis, can easily come to the International University Sanatorium, and stay for cure and private study at a far less expense than at any other modern sanatorium or clinique. The treatment by means of Heliotherapy is not

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Sanatorium Universitaire

practised in bone cases in India. Some of the difficult means of treatment of Pulmonary Tuberculosis, such as, cutting of adhesions, alcoholization, thoracoplasty, etc., are practically unknown in India. I can state from personal knowledge that nowhere in India, not even in Kasmir, do we have such excellent climatic conditions—dry cold, freedom from humidity, purity of atmosphere particularly during the six months of snow—as we find in Switzerland. No one need be afraid of the cold, for with modern electric heating arrangements we do not feel it at all. Why should we not then make it possible for a few well-chosen Indian University students suffering from tuberculosis, to take their treatment at the International University Sanatorium under the best and most renowned physicians and surgeons of Europe? How? By purchasing a few beds, say ten, now at that proposed Sanatorium. It is easy for us to say that we should ask the central Government to find money for the purpose; but I attach very great importance to *self-help*. I have been greatly impressed by the wonderful power of organization shown by the University students of Europe and by their useful activities. I may mention in this connection that the following International Students Organizations are actively participating in the work and are represented on the Committee:

(*i*) The International Confederation of Students

(*ii*) The International Federation of University Women

(*iii*) The International Students Service

(*iv*) The International University Federation of the League of Nations

(*v*) Pax Romana

(*vi*) The World Students' Christian Federation.

(*vii*) The World Union of Jewish Students

Let once the students of Indian universities realize the importance, the imperative necessity of having a few beds reserved at the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

International University Sanatorium, and I am sure the accomplishment of the object will be only a question of months. If under the auspices of the university union at each Indian University centre and under the guidance of the Vice-Chancellor, meetings be held by the students and professors to explain the project of the I. U. S. and if the Indian students resolve to participate in the establishment of this international institution for their own good and that of their successors, let them subscribe, once for all, a paltry sum of eight annas per head, and the sum realized will be sufficient to meet the cost of one bed. When the scheme is supported by all the Vice-Chancellors and the provincial Ministers of Education, the Indian Education Member of the Government of India will, I am sure, be only too glad to patronize the International institution by reserving at least ten beds for Indian University students and professors.

Any one who sees the zeal, the enthusiasm, the earnestness with which Dr. Vautheir, the friend and benefactor of the Youth of the World, is working for the great dream of his life, cannot but pray that the day of the realization of his dream may come soon. I believe that all humanitarian work is God's work and that it does not fail for lack of funds. "To labour is to pray" ; but the labour which is of one's own free will undertaken, as by the learned Doctor, to relieve suffering humanity, to relieve the young students who are the joys of their families and the hopes of their nations, but touched, alas ! by the blasting hand of sickness while in the pursuit of their studies with the goal of life in sight—is one of the purest forms of prayer. Will such prayer go unheeded ? Will such unselfish labour be in vain ?

Let the Indian University Students answer !

EUROPE AND INDIA

The original painting has been presented to Indian Institute of Die Deutsche Akademie by the artist, Mr. Sekumar Deuskar, who studied art in Munich. The picture is meant to represent the spirit of the present age, in which a serious attempt is being made by some cultural men of the East and West to know and appreciate each other.

THE END OF THE NOBLE EXPERIMENT OF "PROHIBITION" IN THE U. S. A.

By P. GOPALA KRISHNAYYA, M.A., M. SC.,
Columbia University, New York

THE era of prohibition is over in the United States. The repeal of the Eighteenth Amendment to the constitution ended one of the most far-reaching social experiments in the history of the world. It lasted nearly fourteen years. Never before had there been such an attempt to regulate the habits and customs of a nation of 120,000,000 persons of such varied national strains by sumptuary legislation. It was the first time the power of the American Federal Government has been exercised to reach into the private lives and moral conduct of the people of the states on any such extensive scale.

National prohibition followed three-quarters of a century in which the States tried to regulate and control the liquor traffic by State and local option laws. At the time the Eighteenth Amendment went into effect State-wide prohibition was already in effect in thirty-three States, in eighteen of which it has been incorporated in the State Constitutions. 90 per cent of the townships and rural precints, 85 per cent of the countries and 75 per cent of the villages were dry by State legislation. More than two-thirds of the population and 95 per cent of the land area of the United States were under prohibition.

State and local laws and the temperance campaigns that were conducted many years in the wet areas did not satisfy the prohibitionists. They argued that tremendous social and economic advantages would follow national prohibition, that crime and insanity would be reduced, jails and insane asylums closed, workmen's pay diverted to food, clothing and other goods instead of the saloon; industry, trade and commerce stimulated by the new buying power.

The Anti-Saloon League raised large campaign funds among members of the evangelical churches, who were devoted to the ideal of national prohibition on moral and social grounds, and among large industrialists and other capitalists who were convinced that it would increase the economic efficiency of the nation and of their own corporations. One of the most effective propaganda campaigns in the history of the country was organized.

Beginning in 1911 when the proposal came before the American Congress, national prohibition grew in strength as an issue every year, slowly but surely. It might have taken many years to come to a head had not the world war given it a tremendous impetus through the desire to conserve grain supplies for food instead of alcohol and to keep liquor from the soldi... Coming then, when the interest of the nat... was concentrated on the war and when milli... of men were away in uniform, national proh... tion was a sudden surprise and shock to m... Americans.

Drafted by senator Sheppard, the Eighte... Amendent was submitted to the States by a v... of 65 to 20 in the United States Senate ... August 1, 1917, and a vote of 282 to 138 in ... House of Representatives on December 17, 1... The first State to ratify was Mississippi, ... January 8, 1918. Nebraska became dry ... January 16, 1919, the thirty-sixth State to rat... completing the three-fourths of the forty-e... States necessary to make ratification effective.

In the end, forty-six of the forty-eight St... ratified the amendment, only Rhode Island ... Connecticut refusing to do so. Ratification ... accomplished by vote of the State Legisla... in the various States, rather than by pop... vote in State Conventions as specified in ... twenty-first (or repeal) Amendment. The off... figures in the forty-eight State senates w... 1810, or 84·6 per cent for ratification to ... against; in the House of Representatives 3,782, ... 78·5 per cent for ratification to 1,035 against.

Meanwhile, on November 21, 1918, ten d... after the signing of the Armistice, the Amer... Congress enacted the war-time Prohibiton ... which remained in effect until the Eighte... Amendment became effective, on January ... 1920, one year after ratification.

The Volstead Act, fixing one-half of 1 ... cent by volume as the definition of the alcol... content of an intoxicating beverage and provi... for the enforcement of national prohibi... first as applied to the war-time Prohibition Act ... later the Eighteenth Amendment, was adopted ... the Senate and the House of Representatives ... October 8 and 10, respectively, in 1919, ... by President Roosevelt on October 27, and pa... by the American Congress over his veto ... following day.

The constitutionality of the Eighteenth Am... ment and the Volstead Act was challenged ... was sustained in the decisions of the United St... Supreme Court on June 1 and 7, 1920. "Concu... highest court also held that the "concurrent ... power" granted to the States in the Eighte... Amendment authorized them only to ena... prohibition, not to thwart or defeat it.

From the very beginning countrywide pr...

was engendered by the Eighteenth Amendment and the Volstead Act. Not only were houses divided against each other but also churches, political parties, business organizations, social groups, whole communities. Prohibition became the most controversial issue in the United States since the civil war.

Dr. Nicholas Murray Butler, President of Columbia University, took the lead among the intellecutal, and former Governor Alfred E. Smith of New York among the political opponents of the Eighteenth Amendment. Both started early to fight it and carried their opposition consistently to the end, Dr. Butler going so far as to openly advocate revolt against it as utterly contradicting the spirit of the Constitution and the Bill of Rights, if it could not be repealed. Governor Smith split the Democratic party temporarily through his unsuccessful fight for the presidential nomination in 1924 and his nomination in 1928, when he took a far more advanced stand against prohibition than other wets in his party were willing to take in those days, and when the party platform remained dry.

During the early years of the great experiment the opposition did not gain much headway. Aside from the extremist prohibition leaders, national prohibition had many supporters among such political leaders as Herbert Hoover and Senator William E. Borah, and such industrialists as Henry Ford, who believed that it was entitled to a fair trial in view of the theoretical advantages which would follow if it could be made to work.

With prosperity so great that taxes were not a burden and with bootlegging, rum-running and speakeasies so widespread that no one really was deprived of his favourite beverages, the general public remained more or less apathetic for several years as the prohibitionists pressed the Federal Government to more drastic enforcement activities and as unwholesome social trends developed in American life in consequence of the growing power of the under world.

Enforcement was most effective in the first two years of prohibition—1920 and 1921—when the country was still under the influence of the wave of dry sentiment that had carried the Eighteenth Amendment into the Constitution. Forty-seven States, Rhode Island being the only exception, adopted state enforcement laws. New York state adopted the Mullan-Gage Enforcement Act, but repealed it in 1923, the repealer being signed by Governor Smith despite warnings that it would end his political career.

Throughout the past ten years there has been a progressive disintegration of enforcement.

As the years passed it became apparent that national prohibition, instead of bringing great economic benefits to the country, was diverting billions of dollars from legitimate business channels and from governments, sources of tax revenues to criminal syndicates. Instead of creating a new and better social world, it was obviously bringing the under-world up to a position of such financial and political influence that it would corrupt office-holders and the police on an unprecedentedly broad scale ; that it could engage in its private wars, killings, kidnappings, torturings, hijackings and shake-downs, in defiance of constituted authority ; that it speakeasies were as bad or worse than the old saloon ; that its minor henchmen or hirelings were crowding the courts and jails, and that its openly scandalous conduct was setting a bad example to the youth of the land, not only in excessive drinking, but also in general contempt for law and orders.

Treaties with foreign nations enabling the coast guard to search rum-runners flying foreign flags within the twelve-miles limit or one-hour run from the American coast, raids on distilleries and breweries, padlocking of speakeasies, seizures of automobiles and trucks loaded with liquor, pitched battles in which both dry agents and rum-runners were killed, and thousands of arrests, fines and imprisonments, all figured in the unsuccessful effort to enforce national prohibition.

In 1926 General Lincoln C. Andrews, a retired Army Officer, appointed as Assistant Secretary of the Treasury to reorganize the enforcement system asserted that the Volstead Act could not be enforced under existing conditions, that the prohibition agents did not seize more than one-tenth of the illicit stills in operation, and that from 12,000 to 15,000 men would be needed to patrol the borders to stop smuggling of liquor. Emory R. Buckner, then United States' Attorney at New York, estimated that "reasonable enforcement" in New York State alone would cost more than $ 70,000,000 a year, seven times more than the enforcement appropriation for the whole country that year.

In 1929 and 1930 final efforts were made to solve the problem by more drastic enforcement. The Jones "Five-and-Ten" Act, passed by Congress and signed by President Colvin Coolidge, provided for five years' imprisonment and $ 10,000 fine for violations of the prohibition law. The theory was that the violators would be frightened into compliance with the law. Greater efficiency in enforcement was expected from transferring the Prohibition Bureau from the Treasury Department to the Department of Justice. Both these efforts failed.

As the depression deepened bringing with it a larger tool burden in terms of a reduced national income, the effects of prohibition in the costs of enforcement and the sacrifice of large potential tax and customs revenue from the liquor industry came to the fore in public discussion in every State. Even in the former dry rural sections the demand became strong to legitimatize the liquor trade so that taxes upon it might relieve the tax burden upon industry, agriculture and the home, and so that

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

a new industry might give impetus to business activity and employment.

At the same time the moral argument against prohibition gained weight with the publication of the Wickersham Report in 1931. Of the eleven members of the Wickersham Commission, two favoured repeal, seven revision, and only two retention of the Eighteenth Amendment. Moreover, the Commission's investigation had confirmed the common knowledge of the failure of the prohibition experiment from the standpoint of social reform.

Last year was the crucial one in the fight against prohibition. The Democratic party put a repeal plank in its national platform and made repeal one of the leading issues of the campaign. John D. Rockefeller Jr. and other former supporters of prohibition among the capitalist and industrial leaders publicly reversed their position. The Association against the Prohibition Amendment and the Women's Organization for National Prohibition Reform conducted nation-wide propaganda campaigns on almost as extensive a scale as the Anti-Saloon League's campaign for prohibition years ago, whereas last year the Anti-Saloon League made only comparatively feeble attempts to stem the tide.

The result of the election made it clear that the new Congress had a mandate from the people to repeal the Eighteenth Amendment. Even the old lame-duck Congress saw the handwriting on the wall, and voted to submit the repeal amendment to the States. The Senate voted 63 to 23 on February 16, 1933, and the House of Representatives 289 to 121 on February 20.

Since then ratification process had gone rapidly in practically every State with an overwhelming majority.

Prohibition is now dead in these United States. The prohibitionists sought to put the cause beyond the reach of public opinion. They have now discovered that they reckoned ill with the resourcefulness and determination of democratic America. The higher and more insurmountable appeared the barriers created around prohibition, the more resolved were the people to break through them and destroy it.

The whole affair is a fresh and overwhelming demonstration of the fact that in this country public opinion rules. In the end it will have its way. Thus besides the immediate question of getting rid of constitutional prohibition, we have this instructive showing that the American political methods and policies are always subject to control by the deliberate will of the people. In 1920 this looked impossible. By 1933 it had become an established fact.

RAMMOHUN ROY CENTENARY CELEBRATIONS AT CALCUTTA

THE Calcutta public celebrated the Centenary of the death of Raja Rammohun Roy on the 29th, 30th and 31st December, 1933, at the Senate House of the Calcutta University in a manner befitting the great occasion.

The dais, with a specially constructed platform, was beautifully but soberly decorated with flowers, evergreens and festoons. The Raja's full-size portrait in oils, kindly lent by the authorities of the City College, was placed on a table at the end of the Hall, facing the audience. Several loud-speakers were installed in various parts of the Hall and its vestibules.

On the dais were seated the Vice-Presidents and Office-bearers of the Centenary Committee, and those who were to address the meeting. The choir were accommodated near the dais. Numerous volunteers, wearing badges with the words "Rammohun Centenary" and pictures of Rammohun printed on them, were in attendance.

Throughout the three days' proceedings the great Hall was almost always filled to its utmost capacity. Some of the most distinguished sons and daughters of India attended and took part in the functions, among them being Rabindranath Tagore, Mrs. Sarojini Naidu, Madame L. Morin, Dr. (Mrs) Muthulakshmi Reddi, Maharani Sucharu Devi of Mayurbhanj, Miss A. Margaret Barr, Rajkumari Amrit Kaur, Mrs Cousins, Sir S. Radhakrishnan, Mr. G. A. Natesan, Dr. S. K. 1st. Session, 29th December, 12 noon to 4-30 p.m.

The First Session, which commenced at 12 noon on Friday, the 29th December, comprised the **Presidential Address of Rabindranath Tagore** and the **Convention of Religions.**

Long before the appointed hour distinguished ladies and gentlemen representing different communities and cultures of India gathered at the House to pay their homage to the Maker of Modern India.

On the arrival of the Poet, he was led to the pulpit. With his flowing grey beard and grey locks, sitting in a meditative posture, he recalled the saints of old.

The proceedings opened with the singing of the Vedic hymn यो देवोऽग्नौ (with a Bengali version by Mr. Kshitindranath Tagore) to the accompaniment of several musical instruments by a large choir composed of both ladies and gentlemen. Rabindranath, seated on the platform, read in solemn and measured cadence his well-known prayer beginning with the words "Where the mind is without fear, and the head is held high." He then delivered his Presidential Address in Bengali on भारतपथिक राममोहन which was listened to with rapt attention by the vast audience.

Though on the wrong side of 70, the Poet's voice did not suffer with his growing years. He read out the whole address in his inimitable style which was the envy of young and old alike. Sonorous yet impressive, sweet yet emphatic, the Poet was heard without the help of the loud speaker, from the remotest corner of the Hall. He first tried the loud speaker, but science played a trick, and his voice did not reach all ears. When he put aside the transmitter and produced a clearer natural voice to convey his all-embracing message to every heart, it was a case of science yielding to nature.

Dr. Tagore's address was on *India's Message to the World*. Raja Rammohun Roy was the Ambassador who communicated that message abroad. India's Message is Unity, Universal Brotherhood.

Next, Mrs. Sarojini Naidu delivered an oration in her own inimitable manner, embodying the substance of Rabindranath's Address and eloquently paying her own homage to the great Raja.

Her poetic, flowery language charmed the audience who listened to her with breathless silence. The English rendering did not suffer in the least in comparison with the original. She went on like a flowing river murmuring with the songs of the great Poet.

After Mrs. Naidu's speech Dr. Tagore rose and expressed his inability to conduct the proceedings throughout due to weakness. He invited Mahamahopadhyaya Pramatha Nath Tarkabhusan to adorn the Chair. The Poet accompanied by Mrs Sarojini Naidu then left the Hall.

THE CONVENTION OF RELIGIONS then commenced with an Address in Bengali from the President, Mahamahopadhyaya Pramatha Nath Tarkabhushan, on *Rammohun from a Hindu view-point.*

Mr. Santosh Kumar Basu, Mayor of Calcutta, in a short speech referred to the numerous messages received on this momentous occasion by the Centenary Committee from various cities in India and abroad. Dr. Kalidas Nag read out, first, a list of these messages, and then a few words from some of them. Messages were received from MAHATMA GANDHI, Ellore, SIR P. C. RAY, C. F. ANDREWS, London, DEVAPRIYA VALISINHA, General Secretary, Mahabodhi Society, Sarnath, Benares, the ALL-INDIA BUDDHIST CONFERENCE, Darjeeling, PURAN CHAND NAHAR (on behalf of the Jain community), PANDIT DEVA SHARMA, Principal, Gurukula University, Kangri, The Hon. SARDAR SIR JOGENDRA SINGH, Punjab, S. PARTAP SINGH M. A., LL. B., Advocate, of Lahore, SIR SYED ROSS MASOOD, Vice-Chancellor, Muslim University, Aligrah, Right Rev. BISHOP H. PAKENHAM-WALSH and A. J. APPASAMY of the Bishop's College, FATHER VERRIER ELWIN, Karanjia, Mandla Dist., Rev. W. H. DRUMMOND, Oxford, Bishop GEORGE BOROS of the Unitarian Episcopacy of Cluj-Kolozsvar, Rumania, REV. J. T. SUNDERLAND, Ann Arbor, Michigan, U. S. A., REV. F. C. SOUTHWORTH and ALICE B. SOUTHWORTH, Melrose, Mass., U. S. A., ROBERT C. DEXTER, American Unitarian Association, Boston, U. S. A., DANA MCLEAN GREELEY, Young People's Religious Union, Boston, U. S. A., REV. HENRY WILDER FOOTE, Belmont, U. S. A., L. D. WALD, Henry Street Settlement, New York, ALMA L. LISSBERGER, New York, the EAST BENGAL BRAHMO SAMAJ, Dacca, GIRISH CHANDRA NAG of Dacca, the ANDHRA THEISTIC CONFERENCE, Rajahmundry, V. VARADARAJULU NAIDU, Dewan Bahadur HARBILAS SARDA, Ajmere, the ACTING CONSUL-GENERAL for Germany, the CONSUL-GENERAL for Czecho-Slovakia, NICHOLAS ROERICH, S. CHARLETY, Recteur, University of Paris, Lt.-Col. BONNAUD, French Trade Commissioner for India, Burma, and Ceylon, SIR ATUL C. CHATTERJEE, Weybridge, Surrey, England, and the LONDON CELEBRATION COMMITTEE.

Madame L. Morin, a great admirer of Rammohun Roy, who is collecting materials for writing a biography of the Raja in French, delivered a message on behalf of the French public. Dr. Batakrishna Ghosh, who had just returned from Paris, gave an account of the celebrations in France organised by Prof. Sylvain Levi, whose original message in French was read at the meeting and explained.

Maulavi Abdul Karim, M.L.C., then read his paper on *Rammohun as a Roligious Reformer*. A second hymn in chorus (भुवनवासी सबे गाओ) having been sung, Mahamahopadhyaya Pramatha Nath requested Principal J. R. Banerjea, M.A., B.L., to take the chair. Mr. E. A. Arakie, Honorary Secretary, Elias Meyer Free School and Talmud Torah of Bowbazar, then read his paper on *Rammohun from the view-point of Judaism.* He was followed by Dr. Benimadhava Barua, whose subject was *Rammohun from the Buddhist standpoint.* Next, Miss A. Margaret Barr, who represented the "Order of the Great Companions" of Dublin, read her paper on *Rammohun, the Universalist.* She was followed by Swami Adyananda of the Ramkrishna Mission with his paper on *Rammohun and the Re-awakening of Modern India*, and Pandit Rishi Ram, B. A., of the Arya Samaj, who read a paper on *Rammohun from the standpoint of the Arya Samaj.*

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

After this Prof. Uttam Singh M.A, of the Khalsa College spoke on *Rammohun and Sikhism*.

Dr. Kalidas Nag then read the substance of Rev. W. S. Urquhart's paper on *A Pilgrimage in Memory from a Christian standpoint*, Mr. Ramananda Chatterjee's paper on *Rammohun's Monotheism as an aid to Nation-building*, and Mr. D. J. Irani's paper on *Rammohun and the Teachings of Zoroaster*, the writers themselves being unavoidably absent.

The proceedings of the CONVENTION OF RELIGIONS, came to a close at about 4-30 P.M. with the Presidential Address of Principal J. R. Banerjea.

SECOND SESSION, FRIDAY, 29TH DECEMBER, 6-30 TO 8-30 P. M.

WOMEN'S CONFERENCE.

The WOMEN'S CONFERENCE was held the same evening at the Senate House. The ALL-INDIA WOMEN'S CONFERENCE, which was in session in Calcutta, had resolved at its Standing Committee meeting of the 27th December to join this CONFERENCE in celebrating the Centenary of the Raja. In accordance with this Resolution, a large number of Delegates and Members of the All-India Women's Conference also attended the Rammohun Centenary meeting at the Senate House, which was filled to overflowing.

Mrs. Kumudini Basu in a few well-chosen words paid her tribute to the memory of the Raja, and proposed the Dowager Maharani Sucharu Devi of Mourbhanj as President. Mrs. Basanti Chakravarti seconded the proposal. After Maharani Sucharu Devi had taken the chair, the proceedings commenced with a hymn of Rammohun Roy (भाव सेइ एके) sung in chorus by ladies.

Maharani Sucharu Devi first offered a prayer in Bengali, and then delivered her presidential address in English. Dr. (Mrs.) Muthulakshmi Reddi then moved this Resolution :—"This Conference of women pays its respectful homage to Raja Rammohun Roy during his Centenary Celebration for his inestimable and magnificent services to humanity, to his country and to the cause of Indian Womanhood." Rajkumari Amrit Kaur seconded the Resolution. Mrs. Sarojini Naidu, Mrs. Cousins, Madame L. Morin, Mrs. Hemalata Sarkar, Mrs. Shamsun Nahar Mahmud, and Sja. Hemlata Devi spoke supporting the Resolution. Speeches and papers by Sjas. Sita Devi, Santa Devi, Nirupama Devi, Mrs. Sarojini Datta, Mrs. Sobhana Nandi, Mrs. Sudha Chakravarti, Mrs. Saralabala Sarkar were held over for want of time.

The proceedings came to a close at about 8-30 P. M. with a hymn (भारत भाग्य आकाशे उदिछे मेघमुक्त तरुण तपन) specially composed for the occasion by Sja. Hemlata Devi, a great-great-grand-daughter of Rammohun Roy, sung by a choir of students of the Sarojnalini Institution.

THIRD SESSION, 30TH DECEMBER, 3 to 6-15 P. M. GENERAL CONFERENCE

This day's proceedings began with a hymn (शुभ दिन छाणे शुभ एइ मासे) sung in chorus and a prayer offered by Dr. Heramba Chandra Maitra. Sir Nil Ratan Sircar then rose to propose to the chair Sir J. C. Bose, who was greeted with cheers as soon as he was seen on the Dais. The solemnity of the great occasion, and the emotions that surged in Sir Nil Ratan's heart at the remembrance of services rendered to the country and to humanity Rammohun Roy, and by Sir Jagadish, who was present with him in the flesh, so overpowered Sir Ratan that his voice was almost choked. Dr. Pramatha Nath Banerjea seconded his motion.

Sir J. C. Bose then delivered his presidential address, the main themes of which were *the Unity all intellectual life as taught by, and the fire-heat incandescent life as exemplified by Rammohun R*. Two messages received since the last day's meeting having been read by Dr. Kalidas Nag, Prof. Rai Kanta Guha read his paper on *Rammohun and Poli*. At this stage Sir J. C. Bose requested Sir Sarvapalli Radhakrishnan to take the chair. Dr. Nares Chandra Sen Gupta then read his paper on *Rammohun and Law*. After this, Sir S. Radhakrishnan delivered his presidential address on *Mysticism a Charity as blended in Rammohun*. He then request Mr. G. A. Natesan to take the chair.

A second hymn (कि स्वदेशे कि विदेशे यथाय तथाय थाकि composed by Raja Rammohun Roy having been sung by the choir, Mr. G. A. Natesan delivered his presidential address. Mr. Hemendra Prasad Ghose and Prof. Naresh Chandra Ray read papers dealing with *Rammohun and the Freedom of the Press*. After this, Mr. G. A. Natesan requested Dr. S. K. Datta, Principal, Forman Christian College of Lahore, to take the chair.

Dr. S. K. Datta in his presidential address referred to Rammohun's thirst for knowledge, polished manners, and personal magnetism. Prof. Humayun Kabir then read his paper on *Rammohun and Fundamental Unity of all Faiths*. and Mr. Jitendra Mohan Sen his paper on *Rammohun as a Pioneer Education*. Next, Maulavi Wahed Husain read his paper on *the Characteristics of Rammohun's M theism*.

In the unavoidable absence of Dr. Subimal Sarkar the substance of his papes on *Rammohun the Her of a New Age* was read by Dr. Kalidas Nag. Dr. S. K. Datta then thanked the speakers over whose speeches he had presided. The meeting came to close at about 6-15 P. M.

FOURTH SESSION, 31ST DECEMBER, 12 NOON TO 4 P. M. GENERAL CONFERENCE (CONTD.)

In a serene atmosphere, illumined by the mellow glow cast by the midday sun reflected through blue and green glasses of the sky-windows, hallowed by the memory of the great man who was born in the East and buried in the West a hundred years ago, and sweetened by the melodious music of hymns and prayers, the Rammohun Roy Centenary Celebrations came to a successful end this day with the inspiring concluding address of Dr. Rabindranath Tagore. It was a delightful sight to see three great Indians of whom India is justly proud, Mrs. Sarojini Naidu, a poetess of international fame, representing the womanhood of this vast continent, Dr. Brajendranath Seal, one of the world's first-rank thinkers and philosophers, and Dr. Rabindranath Tagore, who has shed lusture on his Motherland by securing garlands of honour from all the world over, assembled together with other ladies and gentlemen of culture to pay homage to another great Indian, Raja Rammohun Roy, who diffused the message of India abroad a century ago. The galaxy of women with their many coloured dress shining in reflected effulgence added charm to the ceremony.

Digitized by Arya Samaj Foundation Chennai and eGangotri

Following the song अयि भुवन मनोमोहिनि sung by a choir of ladies and gentlemen, and a heart-enthralling prayer offered by Prof. Bijay Chandra Majumdar in the strain of "Lead, Kindly Light." Mrs. Sarojini Naidn took the chair on the proposal of Moulavi Abdul Karim, M. L. C., seconded by Dr. B. C. Ghosh.

Dr. (Mrs.) Muthulakshmi Reddi, who was to have been the first speaker of the day, was detained by her duties in connection with the All-India Women's Conference. Madame L. Morin therefore addressed the meeting first. She spoke on Rammohun Roy's short stay at Paris, and how the traces he had left there were now being searched out by his admirers. Maulavi Abdul Karim then read his second paper on the Raja, *viz. Rammohun, the Type and Pioneer of Modern India*, After this, Mrs. Sarojini Naidu delivered her presidential address, in which she described *Rammohun as the Reconciler of irreconcilables.*

Mrs. Sarojini Naidu then requested Sir Brajendra Nath Seal to take the chair. The venerable figure of Sir Brajendra Nath inspired the audience to a spontaneous outburst of cheers. As he was extremely feeble in health, he requested Dr. Kalidas Nag to to read his Presidential Addsess for him. Pandit Sitanath Tattvabhushan then read his paper on *Rammohun's Idea of Worship*, and Pandit Dhirendra Nath Chowdhury Vedantavagis his paper on *Rammohun's Conception of God and the World.*

Sir Brajendra Nath then requested Maulavi Abdul Karim to take the chair. After the second hymn of the day (देश देश नन्दित करि) had been sung, Rao Sahib Dr. V. Ramkrishna Rao addressed the meeting on *Rammohun and the larger Unities of life.* Dr. Saroj Kumar Das was the next speaker, his subject being *Rammohun and Vedanta.*

Rabindranath Tagore arrived at the Senate House when this paper was being read. At the conclusion of the paper, Mr. Pramatha Chaudhuri, being requested by Maulavi Abdul Karim to preside over the remaining part of the day, observed that as the Poet had arrived, and as it would be difficult for him in the present state of his health to stay on for a long time, the remaining papers and addresses—*viz.* Prof. Biman Bihari Majumdar's paper on *Rammohun, the Father of Modern Political Movements in India*, Prof. Ruchi Ram Sahni's paper on *Rammohun's Passion for Liberty*. Prof. Sukumar Sen's and his (Mr. Chaudhuri's) own papers on *The Bengali Prose of Rammohun*, and Pandit Kshiti Mohan Sen's address on योगक्षेत्र भारते पूर्ण साधक राममोहन, *Rammohun the Last Link in the Chain of India's Prophets*,—should all be held over. He then asked the Poet to resume his office of presidentship.

Rabindranath ascended the pulpit prepared for him. Mr. J. N. Basu, General Secretary of the Centenary Committee, presented the following Report of the year's work, and requested Dr. D. N. Maitra to read it out for him :

"The proceedings in connection with the celebration of the Centenary of the death of Raja Rammohun Roy commenced with a Preliminary Meeting held in this Hall on the 18th February last with our illustrious president in the chair. At that meeting three resolutions were adopted,—the *first* offering homage to the memory of the Raja, and calling upon all sections of the people of this country to co-operate in making the celebration a success; the *second* appointing, for the purposes of organising celebrations in Bengal, a General Committee, with instructions to co-opt representatives from different districts of Bengal; the *third* arranging for celebrations in other parts of India.

"A comprehensive Scheme of Celebrations (given in our Publicity Booklet, pp. 152-155) was framed, and a Working Committee and several Sub-committees formed, to give effect to it.

"The Scheme comprised:

"(*a*) Celebrations in Calcutta during the Christmas holidays, consisting of a Convention of Religions, a General Conference for papers and specches on the Raja, a Women's Conference, and an Exhibition of various articles connected with the Raja's life and activities.

"(*b*) Preparation of Publicity literature, and with the help of such literature, and by correspondence, organization of celebrations throughout Bengal and the other provinces of India, and also in London, Bristol, Paris, New York, Chicago, and Geneva.

"(*c*) Pilgrimages to Radhanagar and Bristol.

"(*d*) Publication of the Raja's Works, an Anthology from his writings, interpretative Studies, and Commemoration Volume.

(*e*) Permanent Memorials, in the shape of a Portrait in oils and a Bronze Statue in Calcutta, re-naming the northern half of the Upper Circular Road as "Rammohun Roy Avenue," and the completion of the Memorial Building at Radhanagar.

"(*f*) The Foundation of a Rammohun Roy Chair and Fellowrhips.

"Throughout the year the endeavours of the Working Committee have been directed mainly to the items (*a*) and (*b*). The most outstanding achievements in these respects are (i) the Publicity Booklet, RAMMOHUN ROY: The Man and his Work," edited by Mr. Amal Home, to whom we are indebted in more than one way, which has been a powerful instrument in the hands of the Working Committee in organizing celebrations, and in helping people to form some estimate of the multi-sided personality of Rammohun, and (ii) the success of our efforts to rouse the enthusiasm of people throughout the length and breadth of India, and in places abroad, for the celebration of the Centenary, as has, we presume, been apparent to the public from a perusal of the newspapers throughout the year. We may perhaps add to these the Exhibition of the Raja's relics and the celebrations which are just being terminated in Calcutta.

"For various reasons, not the least of which is the present state of financial depression prevailing in the country, the funds that the Working Committee have so far been able to raise are very small. An account of the receipts and expenditure will be published in the newspapers as soon as possible.

"This inadequacy of funds prevented the Working Commitee from taking any active steps during the year towards the publication of the Works of Rammohun, which was the most cherished item in their Scheme, or towards the Permanent Memorials. It is gratifying to note, however, that the Bangiya Sahitya Parishat, the renowned Literary Society of the province, has undertaken the publication of a comprehensive edition of the Raja's collected Works under the General Editorship of one of our Vice-Presidents, Mr. Ramananda Chatterjee. In view of this fact, the "Works and Studies Sub-committee" decided at its meeting of the 2nd December last, not to proceed with a separate project for the same purpose. The question of co-operating with the Bangiya Sahitya Parishat in this respect is being considered, and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the formation of a small but influential All-India Committee to raise funds for financing the publication and also for the Permanent Memorials is under contemplation. It is to be hoped that when such a committee is formed, and the necessary appeals issued, public response will be forthcoming in a generous measure, so that this Centenary may have something tangible and permanent as its record and achievement.

"In conclusion, we take leave to convey our thanks to all those who have helped us in any way in connection with the present Celebrations. While it is not possible to mention all names individually, we shall be failing in our duty if we do not take this opportunity of recording our sense of deep gratitude to all who have come from far and near to participate in our celebrations,—notably to Mrs. Sarojini Naidu, Dr. (Mrs) Muthulakshmi Reddi, Sir S. Radhakrishnan, Mr. G. A. Natesan, Dr. S. K. Dutta, Rajkumari Amrit Kaur, Rao Sahib Dr. V. Ramkrishna Rao, and to Madame L. Morin, who has travelled all the way from Paris; to all our friends in the other provinces of India, in Burma, in Ceylon, and in Europe and America, who have enthusiastically organized similar celebrations; to the authorities of the University of Calcutta for placing this Hall for the Inaugural Meeting, and for the Convention and the Conferences, and a room in the Asutosh Building for our Exhibition; to the Albert Institute for the use of a room for our Committee meetings throughout the year; to the Sadharan Brahmo Samaj for lending us a room for the Centenary Office, and to Mr. N. Mukherji of the Art Press for printing our literature at exceptionally moderate rates, to Messrs. Dwarkin and Son for lending us the use of a large Organ-harmonium and to our volunteers and musical choirs."

After the reading of the Report, Rabindranath delivered *extempore* his concluding address and benediction in Bengali, exhorting the vast audience and all his countrymen to be true to Rammohun Roy and his ideals, reciting at the end in an impassioned voice his poem हे मोर चित्त पुण्यतीर्थे जाग, रे धीरे। The function came to a close with the singing of the Bengali National Anthem जनगणमन-अधिनायक जय हे by the choir, during which the whole audience reverently remained standing.

The Rt. Hon'ble Srinivasa Sastri, who was to have presided over the General Conference, was the great disappointment of the organisers as well as of the public, prevented by illness from coming to Calcutta. Dr. P. K. Sen, who had just arrived from England, and was expected to give on the 27th December interesting details about the celebrations held in London and Bristol, was also prevented on the day by a sudden illness from coming to the meeting. Dr. Surendranath Das Gupta, who was to have addressed the meeting on *Rammohun and the various Systems of Philosophy*, and Dr. B. C. Roy, who was to have taken part in the proceedings of 27th December, were prevented from doing so by other unavoidable engagements. Letters regretting inability to attend were received from Dewan Bahadur Sir R. Venkata Ratnam Naidu and the Maharaja Bahadur of Pithapuram.

The Exhibition

An Exhibition of Rammohun's portraits, busts, various editions of his works, other relics, and objects related to him was held at Room No. 17 of the Asutosh Buildings from December 24th to 31st. It was formally opened by Sir Deva Prasad Sarvadhikari on Wednesday, the 27th December at 4-30 P.M. After Raja Kshitindra Deva Rai Mahashay of the Bansberia Raj Family had read a paper, Sir D. Prasad spoke about the all-round greatness of the Raja, and the contacts, traceable through three generations, between his own family and that of Rammohun Roy. There was a distinguished gathering of ladies and gentlemen, who inspected the Exhibits with great interest after the ceremony was over. Mr. Ganendranath Banerjee, Secretary in charge, to whom the Exhibition owes its success, courteously pointed out to the visitors all objects of special interest collected there.

Programme Booklet

A booklet with an artistically designed cover depicting Rammohun pointing to the dawn, and containing a tri-colour portrait of the Raja as frontispiece, the detailed Programme of the Convention and Conferences, Tagore's Opening Prayer and President's Address, the Hymns, with an English translation by Indira Devi of the National Anthem and a Catalogue of Exhibits displayed at the Exhibition, was distributed free to the audience.

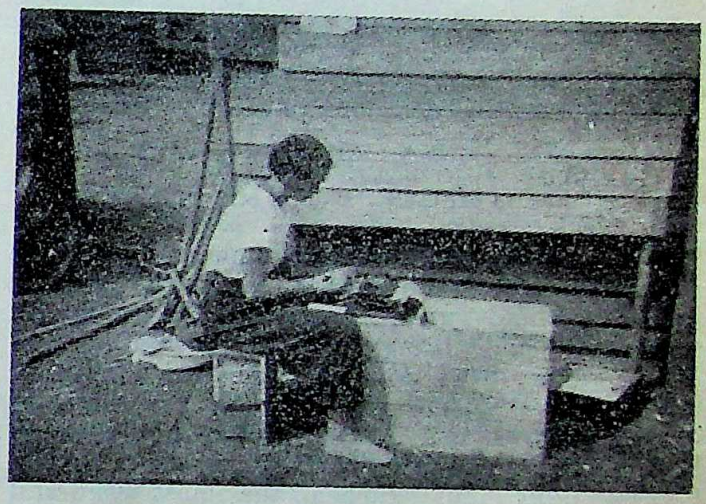
HOW YOUTH OF EUROPE SPENDS HOLIDAYS

By MISS HANNAH BARTH

[Miss Hannah Barth aged only eighteen was the secretary and leader of a Peace and Youth movement in Dresden in Germany during the last three years; and having had to leave Germany last year has now settled in Prague (C. S. R.) with her parents. Though a German by birth she is very internationally minded. Having travelled herself in France, she in return entertained French guests in her family to eradicate in her own way, any unfriendly relations between the two nations. She organized a meeting of her group in Dresden in 1932 where Dr. D. N. Maitra was invited to deliver an address on the national progressive movements in India, and she acted as the interpreter to the audience, interpreting their questions and answers thereto. She is a great admirer of Tagore and Gandhi and it is her ambition to visit India which has a large and warm corner in her heart.—Ed., *M. R.*]

HOLIDAYS last about two months, *viz.*, July and August. This is plenty of time for undertaking some adventure. The kind of adventure wanted must offer both recreation and education. As nobody among us has much money at his disposal—we are students, the oldest of us being 25, but the better part is 16-19—we must think of spending the holidays in a cheap way too. We find our wishes realized in what is generally known as "camp." Let me tell you in details my experiences in a camp. Youth of various classes, confessions, nationalities takes part in it. There were about 40 Czechs, and 35 Germans from Prague and her suburbs, Karlsbad, Brunn, and one boy from Berlin. The party set out in two groups, one a few days earlier than the other, because many preparations have to be done. We travelled together on June 29th in a wagon as soldiers will travel. Seats were formed by the various chests which contain pots, and other kitchen utensils, and stores such as some bread, much sugar, flour, cacao, coffee, tinned provisions, etc. I was much surprised at the discipline and fairness of all the boys and girls. A boy ordered that all of us had to give their food, such as rolls, cake, fruit, etc., to him; and he was, after this was performed, assisted by a few others in dividing and distributing everything in common meals.

Our camp was to be near a little village in the surroundings of (Hlinsko near) Olmutz in Moravia. When we arrived, a farmer who had expected us with his rack-wagon drawn by oxen, welcomed us. Several boys were now busy putting the things directly from the wagon upon his cart. We had also taken with us a few bicycles which we should need for "shopping," in order to fetch the doctor, or any purpose else. Unfortunately it was raining the first days; thus we could not at once go to see the place where the camp was to be built. We lived with the farmer who allowed us to sleep in the straw of



Camp, July 1933. Moravia, C. S. R.
Myself behind the "library."

his granary, to cook in his kitchen and to stay in his garden, where tables and benches were. By the way, a cook had come with us, a kind and reserved girl. And a lady teacher had come too. She was a real comrade to us. In crucial questions, such as to the division of the tents and whether boys and girls should sleep together in one tent (of what I shall have to speak still), she retreated and let us discuss without trying to influence us in any way. Thus we were really independent. And we showed ourselves worthy of it. When sun pierced the clouds we went to the site which had already been selected by expert boys. When selecting the place for the building of a camp, attention must be paid to these necessities: there must be (1) a nice large meadow, woods near by; (2) a source for drinking water; (3) a bathing-place; (4) the roads to the villages or to the town near by. It is most agreeable to build the camp in a hilly landscape, far away from the noise and traffic of the "world." At last, fine days came when there was no thought of rain and no cloud in the clear blue sky. We began to measure the ground. Some of us dragged props and trunks from the mountain down upon the meadow which is in the valley and in which we would build. Planks were ordered in the saw-mill. Nails and all sorts of implements had been gathered in Prague. Everyone had had to contribute from "at home."

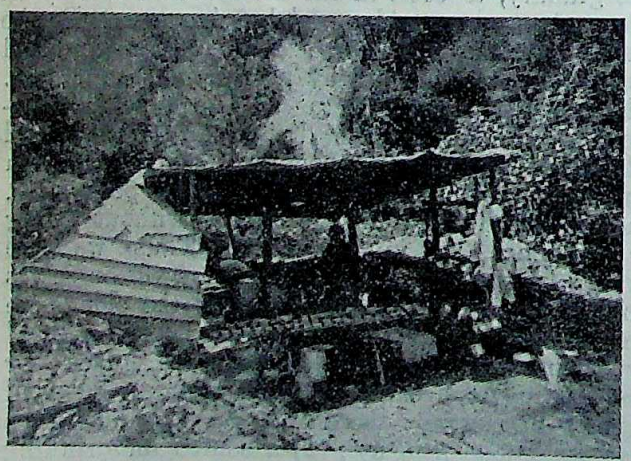
Camp, July 1933. Mosavia, C. S. R.
The tents are built, one is still missing.

Shall I tell you of what names we gave to quite trite things, *e.g.*, to the tents ? I fear I should write too long. We were all very joyful and happy and busy and worked hard ; and there was singing and laughing and joking with us. We wore bathing-suits or ittle black trousers. A girl wearing a skirt would have been an impossible imagination. A few Czechs built the "kitchen" the most wonderful part of which was the hearth. We fetched clay for it from a hill near by, and carefully chose oblong flat stones, seeking everywhere. When the clay had dried, the whole was an admirable



Camp, July 1933. Moravia, C. S. R.

piece of work and most practicable. The iron-plates had been taken from Prague. A deep pit which they dug in the ground and inlaid with fir-branches was the larder. By and by, our whole household was brought from the farm to the tents. There are seven tents on the whole, the library in the middle where the typewriter was on a special little table, the drugs were kept and on the b side of which the news, caricatures on single ev of the camp-life were exhibited. A great num

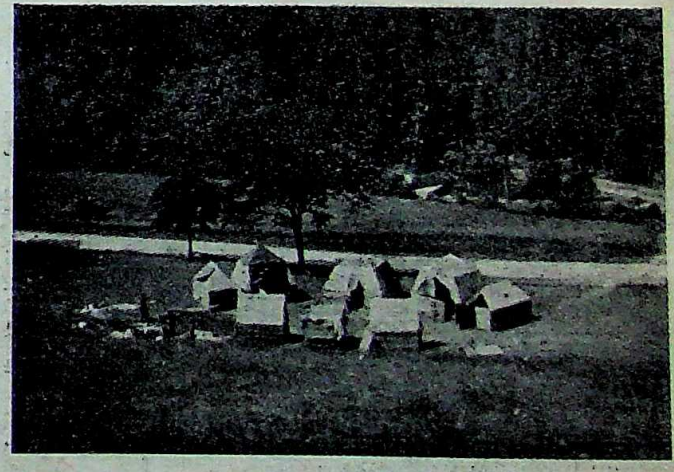
Appell

girls spoke vividly quoting Marx, Reich, and others. As no agreement could be accomplished thus a vote was organized in the way that one party should form one file and the opposite party a file opposite. It was so funny, much noise and much excitement, at first all forming a wild crowd, gesticulating and shouting and trying to convince the adversary. At last two files, insulting each other and laughing at the same time, were complete, the one exactly as strong in number as the other. A committee was elected now, five boys and five girls, who continued the debate on the top of a hill. At last they were successful. In the evening a paper was passed round with the names of the tents and the names of those who should stay in them. The last arrangement had been performed because of making Czechs and Germans mix up and become acquainted with each other. In the tent where I was, there were merely Czechs, and I was glad about this fact as it would enable me to learn much of the language.

On the stay in the camp the chief value was laid upon the lectures and, with that, on the political education of the participators of the camp. All of them were socialists and pacifists. The lectures were instructive, whereas the discussions concerned too the editing of a



Camp, July 1933. Moravia, C.S.R.
The tents complete.

newspaper which would have to introduce the pupils and students in social thoughts. They had published a paper like this before, but it could not be published longer for financial accounts. On the whole, I must say that the influence of camp-life, this healthy life in sun and air is most favourable. Youth amongst youth, that is a good school! I have learnt so many things, become acquainted with so many different young people, with so many different opinions and minds. I wish our Indian friends could enjoy camp-life. I send all of them a heartiest regard, the greeting of camp: Ahoj!

LALA LAJPAT RAI

II. Chats on Men and Matters*

By ST. NIHAL SINGH

I

HAWKERS go about the streets in Punjab towns during the summer crying "phut! phut!!" Persons who have not seen the fruit that these peddlers are selling might be puzzled by that word, which means "broken! broken!!" It is a species of melon. The name given to it exactly describes it. I do not recall seeing a single specimen the skin of which had not burst. When it is ripe it falls to pieces.

I have always found it insipid and avoid it. It must however please some palates, otherwise fruit-sellers would not trouble to hawk it about. Cheapness perhaps has something to do with such popularity as it enjoys.

II

Perhaps because most Punjabis relish *phut* any organization into which they form themselves soon cracks, as does this fruit. So at least was the case with the Arya Samaj, founded a little more than half a century ago.

So far back as my memory goes, it always lacked unity. My earliest recollections cluster round the sharp discord that existed between the two sections into which it was then divided.

These sections had their designations. Rather high-sounding ones.

But persons who prefer to throw hatchets at one another's heads can never expect the lookers-on to remember the contestants by the gaudy labels they give themselves even though they claim to fight in the name of God. Nicknames coined in the mint of irreverence gain currency and no effort can stop them from being used.

As if the Arya Samajists had differences over nothing more serious than their dietary, the two bands into which they were organized during my boyhood days were known as the *mas* (meat) and the *ghas* (grass) party respectively. It was nothing unusual for an Arya Samajist to be asked in a spirit of mischief if he relished *jal tori* or claimed merit for avoiding it. That pun had been constructed by some "jokesmith" who conceived the notion that fish looked like *tori* (a kind of "lady's finger," as the English put it, or "okra" as the Americans call it).

III

The serving maid in the house in East Dulwich (a south-eastern suburb of London) in which we lived from 1912 to 1916 discovered that Lala Lajpat Rai belonged to the *mas* party. She was Irish—irresponsible at times—irrepressible always.

One day as I was going past the kitchen door I overheard this conversation between her and her mistress:

"If it is the gentleman that I have in mind who is coming to dinner tonight, didn't we ought to cook two or three kinds of meat Ma'am?"

Laughing, Mrs. Singh asked her whom she meant.

"The gentleman who laughs so much," she replied.

"You mean the Master?" this from my wife, who evidently was bent upon teasing the maid.

"No, Ma'am," she said, "the gentleman I am talking about laughs much more than the Master. Much more loudly, too."

He came here the other day to tea. I had made heaps of sandwiches—chicken, meat and fish-paste. They all seemed to melt away.

"I says to myself as I brought you a fresh pot of tea: 'the gentleman is partial to meat sandwiches.' It sure is a pleasure to cook for them that eats as if they relish what you have made for them."

I repeated this conversation to Lalaji when

* The preceding article appeared in the January issue of *The Modern Review*—EDITOR.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

he came to dinner that evening. He burst out into a fit of laughter that nearly choked him. The maid, who was in the room, coloured up to the very roots of her hair.

Though he was not a vegetarian, Lalaji drew the line at beef. "I simply cannot touch it," he would tell his Western friends. They knew that for generations untold the cow, as the giver of sustenance through her udders and the service she renders to Indian agriculture through her male progeny, had been deemed sacred. They therefore respected his scruples and did not place beef before him.

I have a recollection that he fancied the vegetables of my own growing that were specially cooked for him more than the meat dishes concocted by the Irish maid. There was a plot of land at the back of the house which I had terraced, mostly by myself. The lowest terrace, almost hidden from the drawing room, had been converted into a kitchen garden. Here I spent a good part of my leisure digging, cultivating, manuring, sowing, and in the summer time watering, the lettuces, cabbages, carrots, parsnips, beets and other vegetables.

Lalaji liked these especially because they were fresh. The stale vegetables that usually found their way to the table in London appeared to him to be tasteless and lifeless.

IV

Beneath the laughter his heart was heavy. He was too devoted to the Punjab to be happy away from it. Every now and again he said something that showed that he was yearning for home. I remember, for instance, his telling me on one occasion while we were at the table:

"When you come to Lahore I will ask my wife to cook *missi-ki-roti* (bread made of wheat and gram flour) specially for you. It is delicious. She makes it better than any one I know."

Had he stayed in Lahore however after the outbreak of the war there is no knowing what might have happened to him. The officials under the leadership of Sir Michael O'Dwyer (then the Lieutenant-Governor of the Punjab) were having things pretty much their own way. They had been armed with special powers, in common with the executive in other parts of India. Scenting a revolutionary plot, they made full use of such powers.

Many Punjabis—mostly Sikhs—had returned just about that time from the Pacific Coast of the United States and Canada to their homes in the Punjab villages. O'Dwyer and his subordinates believed that they had come back filled with revolutionary ideas and were hot on their trail.

No love was lost between Lalaji and the officials, especially after his return from the Fort at Mandalay. He was suspect in their eyes. He might have been involved in this campaign. It was therefore just as well that he was not in Lahore during the years when the war had fanned hatred into a blaze.

V

Since his mind was not at ease, he could not settle down to any serious work. He would, therefore, often sally down from his temporary home in north-western London to our house.

He liked sitting in my study and talking. It was on the first floor at the back of the house, built upon a slight eminence. The land fell away towards the Thames Valley, with Parliament Buildings and the immense structures in which the various departments of State carried on their administrative activities were situated. Beyond that it rose again until it culminated in Hampstead and Highgate, some parts of which were actually as high as or even higher than the tower of Westminster Abbey or the Dome of St. Paul's Cathedral. From where Lalaji and I used to sit talking, this panorama stretched before our eyes whenever we chose to look through the bow window of my study, and the weather was propitious. London was spread out before us as a girl's dower is displayed on wooden cots.

VI

Our conversation used to embrace a large field. Some news in the daily papers or an article in a magazine or review, or a chance remark would send us off on a subject and we would not stop until we had torn it to shreds.

Our talk was by no means confined to Indian topics. Conditions in India however naturally came under discussion oftener than the state of affairs elsewhere.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

I soon found that he did not look upon the years that he had given to the service of the Arya Samaj as time wasted. But he did feel that as a new faith raised its head in any part of India it added to the religious rancour that already existed there. It made confusion worse confounded.

There was too much religion in India, he said. I suggested that it would be more correct to describe it as "what passed for religion". He replied that I could phrase it as I pleased. In any case the fact remained. Creeds divided us. In their name we fought. So long as we continued to do so, there was little chance of our coming together and forming a strong, united nation.

Lalaji was a nationalist and not a separatist. I clearly saw that.

VII

In these talks I also discovered that while Lalaji loved our people, he was not blind to their frailties. He loved them despite their faults. Patriotism did not lie in blinking at the defects in our nature, he would say. It lay, on the contrary, in recognizing them and trying to remove them.

He did not confine his criticism to persons of common clay. He was of the opinion—an opinion which I fully shared that India was badly led—that many of our leaders were not only short-sighted but, what was still worse, they often lacked spirit in some cases to the point of actually being cowards.

He took the view—in which I unreservedly concurred—that it was necessary to put a spark of manhood into Indians. That object, he thought, could be attained only by means of education, employing that word in its widest connotation.

He found fault with the system of instruction in India. It was, he said, based upon an utterly wrong assumption—the inferiority of the East *vis a vis* the West. The Indian intellect was, in consequence, enslaved.

The liberation of the Indian mind was, we agreed, the supreme necessity of the moment. There were stupendous difficulties in the way. They had to be conquered at any cost.

VIII

Such talk often led us to make a survey of the conditions in which the Indian women were bred and born—in which they had their being. Lalaji was ineffably sad at the manner in which their education and well-being were neglected. So long as the mothers of the nation were in a depressed state, he declared the nation itself was bound to remain depressed.

He held equally strong views in regard to the so-called lower orders of Hinduism. The treatment of "untouchables," especially in southern India, he asserted again and again was a blot upon Hinduism.

Sometimes he and I would compare conditions in Britain with those prevailing in our own country, often to India's disadvantage. With what freedom, he used to remark, I could and did express myself in publications issued from London and New York. When would the press in India attain the same measure of freedom !

IX

The more I got to know Lalaji the more I realized that he was a modernist to his finger-tips. He had not troubled to learn Sanskrit nor did he delight in chanting the few *mantrams* that he had memorized. True, he was pressed for time. He himself advanced that as an excuse. But the explanation was made self-consciously. A man of his intelligence and industry could easily have acquired at least a fair knowledge of the language if he wished to do so.

His attention was, however, engrossed in other matters. His chief interest lay in awakening the people among whom his lot was cast to the realities of the days in which they lived. They had fallen into an almost bottomless pit. The height from which they had dropped had only served to drive their feet and legs deep into the soft, mucky bottom of the pit into which they had fallen and thereby made it much more difficult for them to extricate themselves.

The past, as such, had no great interest for him. Archaeology did not make an irresistible appeal to him.

He left severely alone all tomes dealing with antiquity—even our own antiquity. Stones, no matter how delicately carved—no matter how eloquently they spoke of the past—did not move him to ecstasy.

His mind was essentially secular. The peculiar circumstances in which he was reared in his parental home turned it into a religious channel. But it merely floated upon the surface and soon drifted into the vast, uncharted ocean of Indian politics.

I have a fancy that even when he was a zealous Arya Samajist, the purely spiritual aspect of that faith must not have stirred his being to its depths. He occssionally participated in *havana* and joined persons sitting round the sacred fire chanting *mantras*. That was however more a congregational affair than a real spiritual exercise.

At one stage of his career he directed the attention of the people with whom he talked in private and whom he addressed from the platform to India's Golden Age. But only because he wished to create another Golden Age—a brighter Golden Age.

I have known few men who were fonder than he of history, particularly biographies. None was more anxious to use the lives of great patriots—Indians and non-Indians—to kindle enthusiasm in the youthful Indian heart for service to the country.

X

Lalaji's emotional nature was as highly developed as his intellect. If anything a little more.

He lavished affection upon every one with whom he came in anything like intimate contact. They could have anything that he had. He would take even more acquaintances to expensive restaurants and theatres.

Children attracted him and he them. Not far from our house lived two friends of his—and ours—Mr. Walter F. Westbrook, an English Civil Servant and his wife, a Scottish lady. They had a daughter about fourteen and a son about eleven. Lalaji used to descend the ladder of time and the children and he would enjoy themselves hugely.

Mr. Westbrook had been religiously inclined from an early age. He would have liked to enter the Church of England. But circumstances over which he had no control prevented him. He appeared instead in the Civil Service Examination and being proficient in English and the classics easily beat all the other candidates. Posted to the Colonial Office, he rose to be the Chief Registrar.

Attracted by Positivism he got hold of everything written on the subject and plunged into it. It developed in him a fine sense of humanity. The barriers of race and creed fell. His interests became world-wide. Intellectuals from the four corners of the globe—among them many Indians—found a hearty welcome in his home.

He was fortunate in his life-partner. Born in Dundee, Jessie Duncan* (to give her her maiden name) somehow or other formed, early in her girlhood, a romantic attachment for India. When only eleven years old she composed a poem extolling the beauties of the Taj Mahal at Agra. About the time we took the house in East Dulwich she returned from a tour in India, in the course of which she had visited most of our famous monuments and religious centres.

Mrs. Westbrook had, if I remember aright, been entertained by Lalaji at his house when she visited Lahore. He in any case was always welcome at 65, Calton Road, in Dulwich village, where she lived with her husband and children.

XI

Lala Lajpat Rai had established contact with some British socialists—mostly of the mildest type. Fabians they called themselves and Fabians they truly were. They no doubt desired a new order—but at a snail's pace, through propaganda. They talked a great deal of organization and a few of them produced tomes that dealt with the emergence of Labour and kindred subjects. So far as I could see however they themselves were content with that contribution and left others to do the actual work of organization with a view to bringing about social reconstruction.

Among the Fabians whom Lalaji had met was Mr. Sidney Webb, whom Mr. Ramsay MacDonald subsequently sent to the Upper House and who assumed the title of Lord Passmore. His wife, whom the Indian leader also knew, insisted upon remaining plane Mrs.

* Mrs. Jessie Duncan Westbrook translated into English some of the late Mrs. Kamini Roy's Bengali poems. These appeared in *The Modern Review* for November 1929.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Sidney Webb, refusing to be called "Lady Passmore."

Mr. Webb started life as a Civil Servant. He was however much too intellectual to be content with the life decreed to permanent officials by the regulations and even more so by the conventions that grow up in a staid life, such as the English had led from the time they went through the industrial revolution up to the beginning of hostilities in 1914.

Taking to Fabianism, and coming in intimate association with Mr. George Bernard Shaw, Professor Graham Wallas and a few other kindred souls, Mr. Webb helped to start an institution that now forms an important constituent college of the London University. It retains the modest name originally given to it—the London School of Economics. I have often wondered if this is a Shavian retort to the Englishmen who delight in calling their 'public schools" colleges. These schoools evidently earn the title of being "public" by virtually shutting out all but rich men's sons.

Mrs. Webb inherited a large block of shares from her father, a railway magnate. She had inherited from him much more than wealth. A fine intellect and great force of character were among her legacies. She cultivated them assiduously. Long before I had the privilege of meeting her, she was acknowledged—and rightly so—as one of the greatest women of the age.

The Webbs collaborated in writing books. Many of the works they produced are still valuable to persons who desire information on subjects connected with the formation and development of the Labour Union in Britain, poor law relief and kindred subjects.

I do not recollect how Lalaji had met the Sidney Webbs ; but they spoke to me of him as a man whose friendship they valued. And he was devoted to them.

He paid Mr. and Mrs. Webb several calls. He also saw a good deal of some of the professors connected with the London School of Economies. He had, I recall, formed a very high regard for Professsor Graham Wallas and I believe for Mr. Lees Smith.

This contact generated in Lalaji the desire to initiate in India a movement similar to the one that had fructified in the establishment of the London School of Economi... at least to persons not in his confidence, to have permitted Lord Minto to deprive Indian leaders of their freedom without charge or trial, greatly enraged Dr. Rutherford. He made it exceedingly hot for the Secretary of State for India in the House of Commons, even though he knew that in so doing he was offending against party discipline. Lalaji never forgot the services that this friend of freedom rendered to the Indian cause at that juncture and always spoke of him in the kindliest terms.

He also had great regard for Sir William Wedderburn, who at that time was at the helm of the British Committee of the Indian National Congress. Coming down from his country seat in Gloucestershire every now and again, Sir William used to take rooms in the hotel attached to the Paddington Station. Either there or at the offices of the British Committee of the National Congress, he would hold conference with Indian leaders who happened to be in London and other persons interested in Indian affairs.

On one occasion I happened to go into Sir William's room just as Lalaji was leaving it. I found him greatly exercised in his mind over his Indian friend's attitude towards the war.

Lalaji, I may explain, thought that the conflict in which Britain was engaged with Germany offered Indians a splendid opportunity to come to an arrangement that would solve our political problem. Sir William took the opposite view. In his estimation Indians had done right in offering aid to Britain without attaching any conditions to such help.

XIII

I do not remember whether or not Sir William had counselled Lalaji to go away from Britain for a time. Probably he had.

Soon after this I learnt from him that he had decided to go to the United States of America. He had not been across the Atlantic Ocean and had a great curiosity to see something of a country of which he had read and heard so much. He might have added that it would also offer him safe asylum, whereas he was not quite sure what might happen to him if he continued to stay in London.

He insisted that before he went, Mrs. St. Nihal Singh and I should have a meal with him.

"But you have no home here," my wife said to him. "You would be put to a great deal of trouble."

"Never you mind. There will be no trouble. I will make all the necessary arrangements," he replied.

She still demurred. But Lalaji continued to plead until we had to give in.

Upon our arrival at the address which he had given us we found a great feast spread before us—an Indian feast. He had sought the good offices of an Indian lady who, with her husband (a law student) was sojourning in London. She had cooked with her own hands a meal fit for the gods.

As soon as the dishes began to be brought to the table at which we sat, my wife realized that the poor lady must have had spent hours in cooking them. When she attempted to chide Lalaji, he refused to be chided. He told her that when she came to Lahore he would have his wife cook specially for her. Then she would see what people in India ate. There in London it was impossible to have all the materials needed in Indian cookery and even though his young friend had done her best the meal was not what he should have wished it to be.

He was, as I have said, a man of generous instincts and his sense of hospitality was exceedingly keen. After the dinner we kept on talking until it was past midnight. We knew that that was our last meeting for some time to come—may be months, as we then expected,—or years,—as proved to be the case.

The parting was sad, particularly because we knew that Lalaji's heart was hungering for home: and yet the Fates were turning his face in the opposite direction.

XIV

From such news as drifted my way I understood that during the five years Lalaji spent in the United States he did exceedingly useful work for our country and our people. He sought out American professors, writers and politicians and gave them information about India and Indians. He also wrote books and articles.

Mr. Huebsch—a Jewish-American publi-

sher—was charmed with Lalaji. He had got in touch with me in 1909. In that year he had bought the rights of publishing in the United States of America the letters written by Keir Hardie while travelling in India. He sent me a copy of the book—one of the first batch off the press. A copy was also forwarded to me for review by the *Nation* (New York)—a high-grade literary weekly—for which I then wrote.

I found Mr. Heubsch a man of liberal views and broad sympathies. So did Lajpat Rai years later and got him to print and to publish two of his books.

Lalaji met many other persons in the United States who esteemed him and whom he esteemed. If India had not needed him he would, I believe, have liked to settle in or near New York. An intellectual man who could write with ease and rapidity and who possessed great conversational gifts and personal magnetism, he would have been successful.

But his heart was in India. He could not bear to be away from his home-land. He attached great importance to propaganda work in behalf of his country: but it did not fill his life. He wished to take an active part in the political movement back home.

Apparently however the India Office took a different view of the matter. He was unable to obtain a passport, without which he could not return to the Motherland.

That view seemed to have persisted at the India Office even after the armistice was signed. Mr. Edwin Samuel Montagu, who had been at its head since 1917, was neither conservative nor narrow-minded. Quite the reverse. Many of his colleagues were, on the contrary, short-sighted and reactionary. He had moreover to carry with him the officials in India, many of whom were bitterly opposed to his policies and did everything in their power to block him.

I feel certain that had Mr. Montagu been differently placed he would have made it possible for Lalaji to return to India earlier than he was able to do. I saw him often in those days and can therefore write from personal knowledge.

Lalaji was suffering too much from nostalgia to lose precious time in making preparations to leave or in bidding farewell to friends. Once he learnt that he was to be allowed to go home he crossed the Atlantic for Britain and, after a short time in London sailed for India.

PROPOSALS FOR AN ALL-INDIA ACADEMY OF SCIENCES

By G. C. MUKHERJEE, M. SC.

Introduction

EVEN at an early stage of civilization, knowledge was regarded as the source of power and pursuit of knowledge was confined to a small class of people (generally the priests), and even amongst them there was much secrecy and rivalry, co-operation being practically unknown. Each individual held fast to his own traditions and his own school of thought, and bitter jealousy leading sometimes to fierce conflicts existed between different schools. With the progress of civilization, however, as the intellectuals and the society realized their duties to each other, it was recognized that the cultivation of knowledge could be carried on more efficiently, if the learned members of the society could co-operate and could come into more frequent contact with each other's achievements and thoughts. For this purpose corporate bodies were organized and frequent discussions used to be held. It was also recognized that knowledge should not be confined to any particular class, but its portals should be thrown open to all who possessed the necessary earnestness of purpose and gifted mental powers.

At the present time we can regard the democratization of knowledge as almost a sure measure of the progress of civilization in a country; for it was almost unknown in medieval priest-ridden societies. Amongst the countries of the Western World, Greece was probably the first to reach this stage, near about the 4th century B.C. The first learned body of Greece, the famous Academy (named after certain Academe) of Athens was founded by Plato, a pupil of Socrates. Plato was not only a philosopher, but was also a great believer in exact science; on the portals of his Academy was inscribed—*"Let nobody enter the Academy who does not know Geometry."* Aristotle succeeded Plato and under Aristotle who wrote on Physics, Ethics, History of Animals, etc., fame of the Academy spread far and wide, and it became the rendezvous of all seekers after truth in the great Empire of Alexander.

Academy of Athens continued its glorious existence even after the political downfall of Greece, and throughout the Roman supremacy, the teachers and scholars of the academy used to receive students even from Imperial Rome. Besides the great Academy of Athens, other learned societies sprang up in various parts of the civilized world, specially at Alexandria, at various places in Asia Minor like Pergamum and Antioch and at Syracuse in Sicily. It is interesting to note that in the Museum of Alexandria, which was founded by Ptolemy Philadelphus and so named because it was dedicated to the Muses, the patron deities of knowledge, all the expenses of the scholars were borne by the king.

The Academy Movement in Europe

The spread of Christianity in the Mediterranean world in the next centuries gave rise to intense theological bigotry, and this killed or drove underground the scientific spirit in Europe for about ten centuries. During the Renaissance period, partly under the influence of Arabic culture, the spirit of scientific enquiry again revived, and a number of learned academies were formed in quick succession. Lead was taken by Italy, then a country of city states, like Venice, Genoa and Florence each of which tried to emulate the achievements of the Alexandrian Museum. The Florence Academy will be long remembered in the Annals of Science on account of the encouragement it gave to Galileo, the inventor of the telescope, and the founder of modern Physics. At the same time was founded the Academie des Lincei* at Rome, which has been recently organized by Mussolini's Government into a National Academy for Italy. Italy being the intellectual leader during the Renaissance, it was but natural that other countries of Europe should follow in her footsteps and should found their own *National Academies* under the idea which may now be considered romantic, that the cultivation of science would usher in a new era in human civilization.

In response to these ideas, the French Academy in Paris whose activities were mainly literary, was founded in 1634 by Cardinal Richelieu, minister of Louis XIII of France. The Academie des Sciences was founded about the same time and among its first members were the philosopher Descartes and the Mathematician Pascal. After the French Revolution, a single Institute de France was organized by Napoleon, of which the various Academies (of Science, Belle Lettres, etc.,) formed branches. By 1630, France had become a great National Unit, but Germany was still divided into a number of petty states whose sole aim was to imitate French manners and customs. The great national institution of Germany, the Prussian Academy of Sciences, was founded a century afterwards in 1740 by Fredrick the Great, who was a great admirer of French culture. It undertook direct and active encouragement of scientific research of the nation by the creation of a number of research professorships and paid memberships; these persons were not expected to do any teaching work and were free to devote the whole of their time and energy to scientific research. Amongst the Academicians of the Prussian Academy, one could find such famous names as those of Voltaire and Manpertuis and the Humboldts in the 17th and 18th centuries, and Vaut Hoff and Einstein in recent years.

The Royal Society of London

The famous Royal Society of London was founded in response to a widespread movement initiated by Francis Bacon who in a pamphlet entitled the *New Atlantis,* advocated plans for a college of learned men where cultivation of science would be properly organized. But the civil war in England soon intervened and the idea could be given effect to only after the Restoration. The Royal Society first took definite shape in 1663 under a Royal Charter from King Charles II, who took an active interest in its foundation, and gave properties worth £1300 from his own pocket towards its foundation. The first meeting took place on May 20, 1663, under the presidency of Viscount Brouncker, a nobleman who was also a mathematician of some note and among the first fellows were Robert Boyle, Christopher Wren (the builder of the St. Paul's Cathedral), Hooke, and the great Newton joined the Society somewhat later. For about 270 years the Royal Society has played a unique and most important part in the intellectual life of the English nation, and it can count among its presidents men like Newton, Davy (Chemist), Hooker (Botanist), Kelvin (Physicist), Lister (Surgeon), Crookes (Chemist), Geikie (Geologist), Thomson, and Rutherford (Physicists) and Hopkins (Bio-chemist), each a giant in his own subject. The above list is enough to excite the envy of any other learned Society of the world.

The Royal Society holds such an eminent position among the other scientific bodies (of which there are many) of England that it will be better here to review briefly its composition, constitution and functions. The Royal Society has about 450 Fellows on its rolls, and about 50 Foreign members. The representation of different Sciences in the present body of Fellows is as follows:

Physics and Meteorology	77
Mathematics and Astronomy	53
Engineering	24
Chemistry	70
Medicine	90

* So called, because the intellectual insight of the Academicians was supposed to penetrate the obscure secrets of nature, as the eyes of a lynx are supposed in fable to be endowed with the extraordinary power of seeing through the solid walls.

Zoology	36
Botany	34
Geology	35
Psychology	5
Miscellaneous	18
National Work	8
Archaeology	3
	—
	453

Among the Foreign members are such men as Einstein, Bohr and Pavlov. Seventeen new Fellows are elected every year. The candidate who wants to get elected will have to get a Fellow who will propose his name and the proposal should be endorsed by six other Fellows. About 120 names are proposed each year of which 15 are elected by ballot by the members of the council and the remaining two are elected for National work. The administration is vested in the council which consists of a president elected for two years, two secretaries elected for eight years, a treasurer and 22 members elected from amongst the Fellows. The President may be elected for a second term.

I shall now briefly describe the functions of the Royal Society at the present time.

The Royal Society publishes two learned Journals—(*a*) The Proceedings which have two sections (*i*) Physical, (*ii*) Biological; (*b*) the Transactions with two Sections (*i*) Physical, (*ii*) Biological. Papers communicated to the society are read in the weekly meetings, and then sent to sectional committees for publication, and if approved are published in the Proceedings or the Transactions.

Besides these purely academic works the society has to discharge a lot of administrative function. It acts, to put the matter in a nutshell, as the *National Governing Body* for the administration of all matters of scientific interest. Through its committees, it administers the following departments:

1. The Government grant for Scientific investigations—amounting to about £ 6,000 per annum.

2. The Kew Observatory: This is the National observatory for research and observations in Magnetism, Scisnology (science of earthquakes) Geo-physics, and Meteorology (science of weather).

3. The Meteorological Office.—(At present under the Air Ministry, but the Royal Society has two representatives on the Governing body).

4. National Physical Laboratory.—The National Physical Laboratory was founded in 1900, following the report of a committee with physicist Lord Rayleigh as Chairman to consider and report upon the desirability of founding a public institution for standardizing and verifying instruments, for testing materials. The administration is vested in a committee of the Royal Society, though in the Executive Committee, other interests are represented. In addition discharging the above functions, the Nati Physical Laboratory undertakes scientific inve gations of national importance, such as, rese in ship-building, radio-telegraphy, metallur and employs a large number of scientific staff.

5. The Royal Observatory, Greenwhich, Timekeeper of the world, was established in 1 on the initiative of the Royal Society.

A committee of the Royal Society form formed the governing body of the institut but now they form the board of Visitors and strongly represented in the governing body.

6. The International Research Council. Science is international and a good deal scientific work has to be done by internati co-operation. So, as a result of series international conferences held in London, P and Brussels during 1918-19, an Internati Research Council was formed for the purp of facilitating international co-operation scientific work and promoting the formation International Unions in different branches Science. The Royal Society, *acting as National Academy of Great Britain* appoints British delegates to the meetings of the Int national Research Council. At present, internati research is carried on in the follow subjects :—

[Quoted from page 148 of the year-book of Royal Society, 1933].

(1) Astronomy, (2) Geodesy and Geo-phys (3) Mathemetics, (4) Radio-telegraphy, (5) Phys (6) Geography, (7) Chemistry, (8) Biology (9) Medicine.

The Royal Society is represented through members in the Selection Committees appointments of Professors in many Universi Colleges and other National Institutions, exerts a very healthy influence in the maintena of proper standard.

Besides these activities, the Royal Society to administer a very large fund amounting several thousand pounds which has b bequeathed to it by successive generations benefactors for founding Studentships, Medi for recognition of meritorious scientific wo A very useful and interesting fund known the Scientific Relief Fund is maintained by Royal Society, the object of which is to scientific men and their families in of emergency. In recent years, a number of manufactures have endowed six-full-time Resea Professorships of annual value of £ 1,500 Before the institution of these Resea Professorships, the Royal Society was behind her continental counterparts (in Fra and Germany.)

Relation of the Royal Society of London to Sectional Societies

Science plays such a great part in activities of great nations that even such a

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

as the Royal Society, with its great age, tradition and highly efficient organization finds it difficult to cope with all the branches of science. So out of the Royal Society has sprung, in different times, the following societies devoted to only the particular subjects of study :

1. The Royal Astronomical Society.
2. The Royal Anthropological Society.
3. The Royal Geographical Society.
4. The Royal Meteorological Society.

The other great Scientific Societies in Great Britain are :

1. The Chemical Society.
2. The Physical Society.
3. The Geological Society.
4. The Linnean Society (Botany).
5. The London Mathematical Society.
6. The Zoological Society.
7. The Cambridge Philosophical Society.
8. The Faraday Society.
9. The Rontgen Society.
10. The Institution of Electrical Engineers.

From the above it will be apparent that inspite of the existence of a large number of societies in England engaged in the promotion of interest and research work in particular branches of Science, the Royal Society is by no means a superfluous organization. On the other hand, it is a very important national institution, as being a Society composed of most eminent scientists and national workers on all lines, it is consulted by the Government on all scientific matters and is entrusted with the administration of scientific departments and institutions. It also acts as a liaison body between societies devoted to particular subjects. Its relation to other scientific bodies is best understood by describing it as *an apex of the pyramid formed by these societies.*

National Academies in other British Dominions

In these days some sort of national academy has become so essential for every civilized country, that all the dominions of the British Empire, have, from time to time, managed to secure Royal Charter for their own national institutions. There is a very old Royal Society of Edinburgh, an old Royal (now National) Irish Academy of Dublin, a Royal Society at Toronto (for Canada), as well as Royal Societies for South Africa, Australia and New Zealand. All these societies have taken the Royal Society of London as their prototype and have similar relation and influence with the Governments and other scientific bodies of their countries. *Among the members of the British Commonwealth of Nations India is the only country which does not yet possess a National Academy of sufficient prestige and power like these Royal Societies.*

Scientific Bodies in India—Official and Non-Official.

In India in fact, the number of learned societies is extremely small. The oldest and the most well known being the Asiatic Society of Bengal which has just celebrated its 150th anniversary. It was founded in 1784 by the famous Oriental scholar Sir William Jones. The chief field of activity of the Asiatic Society has been ancient and medieval Indian History and Archæology in which it has done admirable work. In fact, the Asiatic Society has been mainly responsible for unearthing India's past. It has also got a Natural Science section, and has published very valuable memoirs in Zoology, Botany and Anthropology. In recent years it has organized the Indian Science Congress on the model of the British Association. Through its efforts, the Indian Museum and the Meteorological department were called into being. Next in importance is the Bombay branch of the Royal Asiatic Society, chiefly devoted to ancient Indian History. Other scientific societies devoted to special subjects are the Calcutta Mathematical Society, the Indian Mathematical Society and the Benares Mathematical Society, and the Indian Botanical Society, each of which publishes a journal. The most active society, however, has been the Indian Chemical Society founded in 1925 by the Indian Chemists headed by Sir P. C. Ray. It has already managed to enroll more than 500 Fellows, publishes a monthly journal and has got a paid whole time Assistant Secretary. In Physics no society has yet been formed, though the Indian Association for the cultivation of science at Calcutta, publishes a journal of Physics, in which, mainly the researches of Prof. Raman and his school are published. Another very important body which is not sectional but provincial in its scope, is the Academy of Sciences of the United Provinces. It was founded in 1930 with its headquarters at Allahabad by the scientists of U. P. It represents mainly the scientific workers of that province, but has a considerable number of extra provincial Fellows and Members. It has managed to secure some government support, publishes a quarterly bulletin and maintains a library of journals.

Apart from these non-official societies, there are a number of Government and semi-Government scientific organizations in India chiefly managed by the Services which publish their own journals and memoirs. No civilized government these days can do without undertaking a large amount of systematic scientific and semi-scientific activities including a lot of research work, and has to maintain well-equipped departments for that purpose. To organize and run these departments efficiently, expert advice is essential, for which the Government generally turns to and receives prompt help from the national academy of the country. In these matters, there generally exists a spirit of close co-operation between the national academy and the state. In fact, it is not unusual to leave a part of the actual administration regarding scientific matters in the hands of the national institution as we have seen in the case

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

of the Royal Society of London. In common with other civilized Governments of the world, the Indian Government too undertakes a considerable amount of Scientific work, of which the following are some of the most important forms and are under the direct control of the Government of India.

1. The Indian Trigonometrical Survey at Dehra Dun.

It is responsible for the survey of the Indian Empire and also does a certain amount of work in Hydrography, Seismology and Geo-physics.

2. The Geological Survey of India.
3. The Meteorological Service.
4. The Zoological Survey of India.
5. The Agricultural Service.
6. The Botanical Survey.

Here may also be mentioned the Central Council of Agricultural Research and the proposed Central Medical Research Council. Besides these, many provincial Governments maintain Scientific Departments which are devoted to the study of problems peculiar to those provinces. The Irrigation Department of the Panjab, which has a highly organized Research staff, the Department of Fisheries of Bengal, and the Cotton Research Institute of Bombay are organizations of this nature. In the absence of an All-India Academy of Sciences, the expert advice that the Government needs for the purpose is sought elsewhere. Generally this help has been given by an Indian Committee of the Royal Society of London. Hitherto this Indian Committee of the Royal Society has been the guiding factor in the policy of the Government of India with regard to scientific matters, *e.g.*, in the establishment of the Indian Institute of Science at Bangalore (the original purpose of which was to organize research on industrial problems), in the Forest Research Institute, Bangalore, in the various medical research institutes as well as in the organization of the scientific services advice was sought from the Royal Society. It is also clear that in the absence of a National Academy, the Indian Scientific opinion can have very little influence over the management of the above Government institutions; and very little effective co-operation is possible between the Scientific workers in the Government Institutions and the non-official Indian Scientific workers carrying on research work in various Universities and institutions scattered all over the country.

Recent Proposals for the Formation of an All-India Academy of Sciences

During the last four or five years the Indian Scientists have been gradually awaking to the fact that the absence of an All-India Academy of Sciences not only greatly hampers the cultivation of Science, but deprives the nation of a large amount of valuable service which she badly needs. Eminent individuals, as well as important scientific bodies have from time to time expressed their opinion that an immediate establishment of a National Academy is absolutely essential these stray voices from different quarters have recently developed into a strong movement, and it is to be hoped that the formation of such a body is a question of a few months. The growth of the movement may here be briefly outlined.

Initiative of the Government of India

Towards the end of 1930, the Government of India addressed a letter to the Provincial Governments, the learned societies of India, the Universities and the Indian Science Congress requesting their opinions on the formation in India of (a) a National Research Council and (b) National Committees, to co-operate respectively with the International Research Council and certain affiliated Unions which have been mentioned above. Their views were sought particularly on the following points (a) whether the formation of such a council and committees would be useful (b) what should be the composition and the method of appointment of these bodies, (c) in what ways would the expenses be met, (d) how much control the Government should exercise over these bodies.

In their reply to this circular, the council of the Executive Committee of the Indian Science Congress expressed their opinion that (a) the formation of such bodies would certainly be useful (b) though the ideal constitution of the proposed National Research Council would be one analogous to that of the Royal Society of London, for the present it should include among its members the representatives of the following categories of Scientific workers: (i) Representatives of the Scientific departments of the Government of India, (ii) Representatives of the learned societies and organizations of research (iii) Representatives of the Universities (iv) Eminent scientists, (v) Representatives of such Provinces and the Indian States as are willing to bear part of the expenses.

(c) For the present, the Government of India should bear all the necessary expenses.

(d) The National Research Council should be as free from Government control as possible.

Government action on these proposals has not yet been taken owing to financial stringency but even this preliminary action shows that the Government of India realizes the importance of organizing a National Academy.

The Propaganda by the "Current Science"

The Editor of the famous Scientific weekly *Nature* Sir Richard Gregory, during his recent tour in India, discussed the question of the formation of an All-India Academy of Science with the Editors of *Current Science*. The January 1933 issue of the journal contained an Editorial on the subject, the substance of which can be understood from the following extract

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

"Although Indian Science should command practically unlimited resources, and actually has enlisted a band of competent and highly qualified investigators, it suffers from a lack of financial support and from the lack of an authoritative exposition of its achievements by a central responsible body which can speak on behalf of her scientific men for India, as a whole.—It seems to us that the early establishment of a National Academy of Science should secure closer and better organized co-operation of activities among all research institutions of India. The scope and purpose of the functions of the Academy are therefore different from those of the Indian Science Congress which offers principally the advantage of human contacts. Among other functions which the Academy will exercise should be included the protection and advancement of the professional interests of its members. It should acquire the necessary authority to advise Government, the Universities and other institutions on all scientific matters and other problems referred to it for consideration and to negotiate on behalf of Indian scientific workers with similar institutions abroad;—through its library, the Academy will act as a bureau of information to be disseminated among its members. An Academy of Science is not an ornament, but an indispensable institution for directing the destinies of the nation. We have no hesitation in thinking that its establishment ought to be the natural and legitimate ambition of a progressive Government and an enlightened public who should unhesitatingly provide the institution with sufficient funds for its service in their cause."

The Editors then consulted their board of editorial co-operators and issued over their signatures a circular letter with questionnaire on the subject. The letter stated that if a sufficiently widespread support for the proposal of establishing an All-India Academy would be forthcoming, the investigation of details would immediately engage the attention of a competent committee appointed for the purpose. The questionnaire asked for the views of the addressee on the scope, function, and constitution of such an Academy, its relation to other scientific bodies, about its finances, etc. The Calcutta Scientists gathered together on the 17th September and drafted a collective reply to this circular. They approved of the proposal wholeheartedly and expressed their opinions on various points. They were in favour of associating the new body closely with the Asiatic Society of Bengal and expressed the opinion that Calcutta would be the most suitable place for its location. They however suggested that the various schemes received regarding the formation of the Indian Academy be placed before a special meeting of the General Committee of the Indian Science Congress in its forthcoming Poona (changed later to Bombay) session for full discussion.

Proposals of the Marquis of Zetland and Prof. Thomas for Founding a Royal Indian Academy (of Science, Letters and Arts)

Meanwhile the sounding of opinion for establishing a National Academy was started from another quarter. In April 1933, Lord Zetland, the ex-Governor of Bengal and Professor Thomas, the distinguished orientalist of Oxford, addressed 25 most eminent Indian intellectuals on this subject, on behalf of some British gentlemen who were interested in the intellectual life of India and had gathered together in London to discuss the desirability of an Indian Academy, representative of Philosophy, Science, Literature and Art. They stated that the international influence of a single Indian National Academy will be probably much greater than the united influence of a number of academies, and therefore the former was preferable. As regards the process of initiating such a body, they suggested that the *British Academy might help as far as the Indian opinion would consider such help desirable, specially in such matters as obtaining Government recognition and support and a Royal Charter*. They asked the views of those whom they addressed, as to whether such action on the part of the British Academy would have their approval and support. Among the replies which were sent to them individually, majority were in the favour of establishing a single academy, but some were for separate academies for Science and Arts. They were also informed that in the forthcoming Science Congress (1934), the proposal for an All-India Academy of Sciences would engage the attention of its General Committee. In their reply to Prof. Saha, who was to preside in that session of the Congress, they said that they had hitherto been acting in association with the British Academy who are naturally more interested in a single Academy than in an Academy of Science only, and they suggested that "after the discussion of the matter in the Indian Science Congress (assuming of course that the trend of the discussion did not render such a course impossible) the Council of the Congress be asked to consider whether they might not issue an invitation to those with whom we have been corresponding in India."

The Academy of Sciences in the United Provinces of Agra and Oudh

The Scientists of U. P., however, have taken a most active part in this general movement for a National Academy of Sciences. As early as 1929, in his "Plea for an Academy of Sciences" Prof. Saha indicated the need of a National Academy of Sciences and discussed the question with a number of scientists at the Science Congress which assembled at Allahabad in 1930. As the realization of the proposals, then seemed remote, a more modest institution, the U. P.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Academy of Sciences, was founded in 1930. But the sponsors of the Provincial Academy continued to cherish the idea of an All-India Academy and took pains to invite scientists of other provinces to join the U. P. Academy. For three years this body worked silently and efficiently, receiving wholehearted co-operation of not only the U. P. scientists but of a number of extra provincial scientists as well. In the middle of 1933, time seemed to be ripe and circumstances favourable for forming an All-India institution, and the U. P. Academy took the initiative in this matter by passing the following resolution on the 10th of August, "That the Academy welcomes the proposal of the Council that the Academy of Sciences, U. P., should become the All-India Academy of Sciences."

Just after this a circular letter was sent to the scientists all over India requesting their views on the matter. The following is an extract from this letter: "In the U. P. Academy of Sciences, thus, there already exists the nucleus of an All-India Academy. The signatories to this letter are authorised by the Academy to state, that the U. P. Academy will be only too glad to place its organisation, experience and resources, at the service of the All-India body, and in case the offer is accepted the Indian Academy can come into existence almost immediately."

The comments of the famous scientific journal *Nature* over these proposals of the U. P. Academy were highly reasonable and sympathetic. The Editorial of September 23, 1933 strongly favoured the formation of an All-India Science Academy and wrote: "As a matter of fact when a number of men of science from different parts of India assembled at Allahabad in January 1930, the question of the establishment of an Academy of Sciences in India was thoroughly discussed. It was then decided to start, as an experimental measure, the U. P. Academy of Sciences which would be the official expositor of the research work conducted mainly in the five universities of the United Provinces of Agra and Oudh, and it was also settled that membership would be open to men of science residing outside the territorial limits of the United Provinces. It was also suggested that if the experiment proved successful, the U. P. Academy might later develop into an All-India organization. The progress of the Academy during the last three years has shown that the experiment has been very successful, and members of the Academy residing in other parts of India have suggested that it should become an All-India Academy of Sciences. The U. P. Academy is the first of its kind to have been started in India, and it has, therefore, strong claim to develop into an All-India Academy. We understand that the council has discussed the question recently, and has recommended to the general body of the Academy that its name be changed to the Indian Academy of Sciences."

It was however realized that the Indian Science Congress being the recognized authoritative body representing Indian Scientists, was the only body capable of dealing with such an All-India problem as the establishment of an Indian Academy—hence, the U. P. Academy in a resolution dated December 19, 1933 authorized Prof. Saha to bring to the notice of the scientists attending the Science Congress at Bombay, the resolution of the U. P. Academy of August 10, 1933, and to discuss the whole question with them, and to report to the Academy the deliberations of the Congress, at its next meeting.

The above review shows that the necessity of forming an All-India Academy of Sciences has been emphasized by various authoritative bodies including the Government of India, but regarding the composition and modalities of formation, considerable divergence of opinion prevailed. The greatest divergence of opinion was with respect to the question of location. Naturally enough every society or scientific body wanted the Academy to be located in the particular city in which it was interested. The situation in this case, as in every other All-India affair, was not unlike that in the old Athenian democracy, where every leader of the army, when asked to nominate a captain-general, gave the first vote to himself and the next to somebody else. Generally, the man who got the largest number of second votes was elected. A similar procedure might be needed to deal with the present situation. Thus the different scientific bodies, the Asiatic Society, the U. P. Academy, and the Current Science group, with an admirable spirit of co-operation, resigned all powers into the hands of the Indian Science Congress. The Sponsors of the Congress felt that the discussion of the question of location was unnecessary at that stage, as it depended entirely on the form into which the constitution of the Academy would be finally emerging. They, therefore, submitted to the decision of the General Committee only questions of a general nature. On the 3rd. January, 1934, a special meeting of the General Committee of the Indian Science Congress Association was specially convened for the purpose. At this meeting which was attended by about 75 members from all parts of India, the following resolutions were passed.

Resolution 1

The General Committee of the Indian Science Congress thanks the Editorial Board of the *Current Science* for the excellent spade work in sounding the scientific opinion in India on the desiribility or otherwise of having an Indian Academy of Science and proposing to hand over to the General Committee of the Indian Science Congress the material hitherto collected.

The following is an extract from the letter

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

circulated by the *Current Science* on the replies received to their circular letter :

"I have the honour to submit herewith an analysis of the replies so far received to the questionnaire recently issued under your authority.

"We have so far received 109 replies to the questionnaire of which several represented collective opinions of groups of individuals, Research Institutes, learned Societies and Universities. Over 150 individual scientists (distributed all over the country) are agreed that there is great need for the organization of an All-India Academy of Sciences. Three learned Societies, seven Universities and five Research Institutions have supported the idea after consulting the constituent members ; two individuals have expressed doubts about the need for such an organization at the present juncture ; four have opined that the Indian Science Congress fulfils the functions of an Academy.

"Among those who favour the formation of an Academy, one learned Society and five individuals have suggested a further discussion of the matter at the session of the Indian Science Congress at Bombay and the necessary action to be taken based on the decision reached at the meeting ; all the others are in favour of a Committee appointed by you, going into the question and deciding on the constitution of the Academy.

"There has been some difference of opinion regarding the process of initiating the Academy. The majority approve of seeking State-aid to start an entirely new organization which would be run more or less along the line of the Royal Society of London, the details of the constitution as also the process of initiation of the Academy to be decided by the committee to be appointed by you for the purpose."

The above letter shows that there is an overwhelming majority amongst the scientists and scientific bodies of India for starting a National Academy of Science, and they were all agreed that the task of framing the constitution and taking such other steps as is necessary for bringing the Academy to existence should be left to a Committee appointed by the Indian Science Congress. Accordingly the following resolutions were moved by Dr. L. Fermor, President of the Congress for 1933, and were adopted by the General Committee after a full discussion.

Resolution 2.

In the opinion of the General Committee of the Indian Science Congress, the principal purposes for which an Indian Academy of Sciences is desirable are :

(*i*) To act as a co-ordinating body between scientific societies in India, institutions engaged in scientific work, Government Scientific Departments and Services.

(*ii*) To act as a body of scientists of eminence, to promote and safeguard the interests of scientists in India, and also to act as a National Research Council.

(*iii*) To publish a *Comptes Rendus* of papers read before the Academy and also Memoirs and Transactions.

(*iv*) To keep the door open either for a federation of the Science Academy with other Academies of Letters and Social Sciences which may come into existence.

(*v*) To secure and manage funds and endowments for scientific research.

(*vi*) To do such other things as may be necessary for the promotion of Science in India.

Resolution 3.

Resolved that a Committee be appointed to meet at an early date in Calcutta, with the object of drafting a constitution to be laid before the next meeting of the Indian Science Congress, and to take the necessary steps for bringing the Academy into existence by the end of the year 1934.

Resolution 4.

The Committee shall be constituted as follows :—

1. The outgoing President of the Indian Science Congress.
2. The incoming President of the Indian Science Congress.

(A) One representative each of the following Societies :

3. Asiatic Society of Bengal.
4. Indian Chemical Society.
5. Indian Botanical Society.
6. Mining and Geological Institute, jointly with the Geological, Mining and Metalurgical Society.
7. Indian Mathematical Society. } one joint
   Benares " " } representa-
   Calcutta " " } tive.
8. U. P. Academy of Sciences.
9. Indian Association for the Cultivation of Science. (Calcutta)

(B) Director or a representative nominated by the following All-India Government Departments.

10. Botanical Survey of India.
11. Geological " "
12. Zoological " "
13. Trigonometric " "
14. Meteorological Department.
15. Imperial Institute of Agricultural and Forest Research.
16. Indian Research Fund Association.
17. Imperial Institute of Veterinary Research.
18. Director or representative of the Indian Institute of Science.
19. Representative of the Editorial Board of the *Current Science*.

20-24. The following five members to represent the General Committes of the Indian Science Congress. (They were elected after ballot was taken.)

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

(*i*) Prof. S. N. Bose	...	Dacca.
(*ii*) Mr. D. N. Wadia	...	Bombay.
(*iii*) Dr. S. K. Mukerjee	...	Lucknow.
(*iv*) Dr. K. G. Naik	...	Baroda.
(*v*) Dr. H. K. Sen	...	Calcutta.

The Committee have power to co-opt additional members as required.

RESOLUTION 5.

Prof. M. N. Saha and Prof. S. P. Agharkar be appointed Organizing Secretaries.

The Committee is to hold its first meeting at Calcutta (the venue of the Indian Science Congress for 1935) on February 11 and 12 when mode of procedure will be discussed.

On account of the great public importance of the measure proposed, *The Modern Review* has taken special pains to obtain from the authorities of the Indian Science Congress, a detailed account of the movement. The above account shows that a very good start has been made for a measure of first-rate national importance and the country will watch with great eagerness the working of the Committee. It is hoped that the Central Government as well as the States will give the enterprise their unstinted and whole-hearted support, morally as well as materially.

BOOK REVIEWS

BOOKS in the principal European and Indian languages are reviewed in THE MODERN REVIEW. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.—Editor, THE MODERN REVIEW.

ENGLISH

GANDHI VERSUS THE EMPIRE. *By Haridas T. Mozumdar, Ph. D. Illustrated. Pp. 351. A foreword by Will Durant. The Universal Publishing Company, New York.*

Dr. Mazumdar possesses three essential qualifications for writing such a book about Mahatma Gandhi as Americans need to possess. He knows India well, he knows Gandhi well, and he knows America and Americans well.

1. He knows India as nobody can quite know it except one born and reared there, who has drunk in its spirit from the very breast of his mother, from his father's first embrace, from the profound and lasting influences of his Indian child-companionships, his Indian school-training and the Indian environment everywhere about him moulding his whole nature as a hand moulds clay throughout all his impressionable years from birth to manhood.

2. Dr. Mozumdar knows Gandhi through the close intimacy of living with him in his home; through sharing with him the hopes, the toils, the anxieties and the sufferings of the Mahatma's daring, historic, threeweeks' march on foot to the sea, to break Britain's infamous salt-tax, and thus proclaim to her and to the world India's determination to be free; and, later, through conversations and companionship with the great Indian leader in London, during the second Round Table Conference there.

3. Dr. Mozumdar knows America and Americans through more than a dozen years of residence here, where he has studied in our great universities and achieved high standing as a scholar, and more important still, where he has travelled in all parts of the land, studying American institutions and American life, and lecturing with ability and eloquence in support of the right of his country to self-rule and to a place once more among the world's great nations. The work that he has done and is doing for India, as a public speaker, has been, and is, invaluable.

Dr. Mozumdar has written much on both Gandhi and India. And now, in a sense he gathers up the ripe fruit of it all in this large and striking volume just published entitled *Gandhi versus the Empire*.

In this unique work he gives to the public much valuable information about Gandhi, chiefly in connection with his historic visit to England in 1931, and important utterances from Gandhi's lips—for the most part addresses delivered at the London Round Table Conference, in Parliament and at the many Assemblies, public and private, where he was invited to speak. The significance and value of the book lies mainly in the fact that this important information and these important utterances of the great Indian leader cannot be found except with great difficulty anywhere else, and can be found nowhere else collected together as Dr. Mozumdar gives them in his impressive pages.

J. T. SUNDERLAND

MAN AND TECHNICS: *A contribution to a philosophy of life, by Oswald Spengler, translated from the German by C. F. Atkinson. George Allen and Unwin Ltd., London. Cloth. Pp. x+104. 6sh.*

Oswald Spengler is a profound thinker of very wide erudition. Compared with his huge work, *The Decline of the West*, the present book is a small one. It is both a summary of his known philosophy and an outline of his history of mankind. Accordingly it deals shortly with the whole problem of civilized man's life on earth today and is essentially necessary for grasping modern thought and modern social problems. It is divided into five chapters: Technics as the Tactics of Living; Herbivores and Beasts of Prey; The Origin of Man, Hand and Tool; The Second Stage, Speech and Enterprise; and The Last Act, Rise and End of the Machine Culture.

MY IMPRESSIONS OF JAPAN: *By Sir Lalubhai Samaldas, Kt., C. I. E.; D. B. Taraporevala Sons and Co. Bombay. Rs. 2. Pp. 158. Illustrated.*

The author is a man of business and at the same time a widely read and cultured thinker. Hence, one would expect his book to be both entertaining and profitable reading. It is really found to be such. In it Sir Lalubhai tells us of the national characteristics of the Japanese, their education, factory industries, agriculture and sericulture, civics and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

religion, and describes a hot spring research hospital and some cities and towns. He also gives his impressions of some individuals and associations; and describes his visit to Ceylon, Singapore, Hongkong, etc.

The Japanese national characteristics which struck him were their cleanliness, artistic temperament, politeness of manners, kindness, hospitality and the honesty of the masses.

"Japan is nationalist first, nationalist second, and nationalist last." Japanese education is intended to make the people nationalists and patriots. There were and even now there are factions in the State. But the Japanese have all along avoided foreign aid in internal quarrel and have thus protected themselves from its fatal effect.

"The Japanese are thorough in whatever work or activity they undertake." They understand the value of large combines and refuse to accept defeat. The percentage of literacy in Japan is 99.23 of the total population. In India the percentage of illiteracy is 92!

Those who want to understand why Japan is progressive and efficient and successful in industry ought to read this book.

C.

THE FIRST TWO NAWABS OF OUDH: *By Dr. Asharbadilal Shrivastava, M. A., Ph.D. Professor Maharana's College, Udaipur. The Upper India Publishing House Ltd. Lucknow, 1933; Demi octavo. Pages 300, with a Foreword by Sir Jadunath Sarkar.*

Professor Shrivastava has rendered a great service to Indian history by publishing a full and authenticated account of the careers of the first two Nawabs of Oudh, Saadat Khan and Safdar Jang, covering a period of 34 years, from 1720—1754, that is, the reigns of the two Mughal Emperors, Muhammad Shah and Ahmad Shah, who were mainly responsible for an acute Maratha penetration into northern India. Naturally therefore the historical sources of this eventful period are to be found mainly in Marathi and Persian, each supplementing and to a large extent correcting the other. The credit of first investigating these sources goes to Irvine and Rajwade for the Persian and Marathi languages respectively; but their performance remained necessarily imperfect, as research in many collateral topics had not in their days advanced to that extent which happily we notice today. The Marathi selections published by the Bombay Government out of the Peshwas' Records in their possession have indeed given a fresh impetus to the subject and enabled Professor Shrivastava to test their accuracy or otherwise by dipping into some 50 Persian MSS. and constructing out of both, an accurate and well-sifted account of these 34 years in the form of the careers of the two Nawabs of Oudh, both of whom figured so prominently in the affairs of the Imperial Court. Saadat Khan in the north and Bajirao I in the south, have been exact contemporaries, often opposing each other in war and diplomacy and thus shaping the course of Indian history between them. On this account the task undertaken by Dr. Shrivastava was vast and difficult, wading through an intricate mass of manuscript papers in Persian and the printed ones in Marathi. His acquaintance with the latter is unimpeachable as he has been able to clear accurately and impartially many doubtful points and incidents in which both the Persian and Marathi writers could be reasonably accused of partiality towards their own nationals. The present volume is only a foretaste of what is to come out of his pen in the near future, since he has undertaken to write similar lives of all the succeeding nawabs of Oudh which we are sure will be done in the same critical and penetrating spirit. When he completes this task fully, then will be the time for writing a full and accurate history either of the Marathas or of the later Mughals, with whom the Nawabs of Oudh were closely associated.

The painstaking analysis presented by this author will enable students to realize how the latter Mughal Emperors were utterly devoid of the spirit of valour, decision, and courage in the face of danger which had enabled their ancestors like Babar, Akbar and Shah Jahan to build and consolidate their empire in India. The invasions of Nadir Shah and Ahmad-shah Abdali were understood to be a repeated effort of the Pathans to restore their rule at Delhi by suppression of the Mughals and compelled the Vazirs, Safdar Jang and Ghaziuddin, to call in the help of the Marathas to put down the Rohilla Pathans. These developments were till now inexplicable to purely Marathi students who will wholeheartedly welcome the perspicuous treatment now presented by Prof. Shrivastava.

Apparently he does not notice some recently published Marathi sources, such, as those from the Purandare Daftar, which would have enabled him to put in a few more minor incidents like the murder of Mahadevbhat Hingne, the first Maratha envoy at Delhi, in January 1744 by Safdar Jang. The incident is well narrated in MS. 154 of Purandare Daftar vol. I and well illustrates the trend of Maratha policy. A similar analysis for the first ten years of Bajirao I is even now necessary to clear the first Maratha entry into Malwa and the struggles waged by the Mughal Viceroys, Giridhar Bahadur and Daya Bahadur. For the history of northern India the labours of Prof. Shrivastava are sure to prove invaluable.

G. S. SARDESAI

INDIA IN THE MELTING POT: *By a "Chota Sahib." Published by Lincoln Williams. Publisher Ltd. London. Price 2-6.*

The inordinately long-drawn considerations about granting constitutional government to India have given the opportunity to various people in England to publish books which are essentially ephemeral productions, but serve to misrepresent the case of India for self-government. The book before us is in one of these. It is a farrago of fact and fiction in which fiction easily predominates. The author's claim to "personal knowledge of India" would not stand scrutiny as would be evident from the following statements chosen at random from the book:

(1) "It will not be amiss to State here that Mr. Gandhi is a Brahmin of the Bunnia (shopkeeper) caste and when he was on his way to attend the Round Table Conference the public were mystified by the reports of his doings on board ship and reference was made to the sacred water and Ganges mud he was bringing with him."

Needless to say that Mr. Gandhi is not a Brahman but a Bania (Vaisya) and he did not take with him a single drop of Ganges water or a pinch of Ganges mud for his own edification or for the purification of men like our "Chota Sahib."

A writer who indulges in such hopeless rubbish is not worth arguing with. And his ignorance of facts equalled only by his aptitude for falsehood.

(2) "Two days after his (Mr. Gandhi's) arri-

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

back in India the Bengal Provincial Congress Conference issued the following statement: 'This is an auspicious time for the worship of the Mother Kali and submerge to the bottomless grave by bounds and revolvers the European Association,' which threat they have since essayed to carry out on several occasions with more or less success."

There is no such organization as the Bengal Provincial Congress—the Indian National Congress being an all-India organization and no one in Bengal is aware of any statement like the one manufactured in England having been issued in the Presidency.

(3) "These men and women, (coming from what has been called the 'criminal castes') if not their children, can become very useful tools in the hands of high caste agitators, for although they do not care whom they rob or kill—subject to caste prejudices, they are ready to deal with Europeans, Hindus and Mohammadans alike—the high castes can exercise very great influence over them in person. According to reports the Chittagong District is seething with anarchy and the terrible results of unbridled terrorism."

Not a single recruit from the so-called "criminal castes" has figured in the Armoury Raid or in any other outrage of the kind referred to in Chittagong. If the "criminal castes" can still subsist it is because the British Government in India have not yet made primary education free and compulsory thus neglecting one of the primary duties of a civilized government.

(4) "As an indication of their (the Sikh's) steadfastness it is to be noted that over 80,000 of them served voluntarily during the Great War."

Alas for the veracity of this statement about the Sikhs having served in the British army voluntarily we have not forgotten the statement made in *Truth* by an Englishman immediately after the terrible happenings in the Punjab in 1919. The writer of the article referred to the time when the results of Sir Michael O'Dwyer's recruiting activities were being loudly trumpeted and when he (Sir Michael) was talking publicly of the vast numbers of troops that he still expected to get out of the Punjab and wrote as follows:

"At that period my informant, who has spent the best part of his life in India, came into contact with thousands of the recruits already raised and he was horrified at the unanimity with which they declared that they had not joined voluntarily. The statements of the recruits themselves were confirmed by the conversation with other natives encountered while travelling. It was a common thing to hear them speaking of sons or brothers who had disappeared or were expected to disappear 'without trace' and also to hear discussions as to the best means of thwarting the activities of the native heads of villages or districts. The head men were 'all out' to mop up, by hook or crook, every abler bodied man or boy on their lists in order to earn a public acknowledgment from the Lieutenant-Governor at one of the *durbars* which he held wherever he went."

He added that the term "recruiting" was "only another name for press-gang work so far as the Punjab was concerned" and opposed the proposal to extend Sir Michael's term of office. "Whatever," he said, "may be thought in official circles, the evidence referred to above leaves no room for doubt that the extension of his appointment is bound to create the worst possible impression upon the Punjabis and probably not on them alone."

We are not surprised to find the author being most bitter on Brahmanism and the Bengalee.

"Criminality as a caste is one of the festering sores of Brahmanism"—he says.

In another place the reader is told—"Brahmanism is the most horrible means of political and social degradation left in the world. . . . . Any surrender to it is immoral and would be a huge political mistake, and that is, after all, the alpha and omega of Mr. Gandhi's and his co-Congress Wallahs' machinations and means whereby they have led Western idealists and visionaries into their many traps."

Of the Bengalee the author says—"Nominally Bengal, the house of the arch conspirator, does not contribute a single soldier to the Indian Army during peace time and only contributed 7,000 combatants out of a population of forty-six millions during the war."

Yet Sir Michael O'Dwyer in course of his recruiting tour in the Punjab compared the record of Gujranwala District with that of Bengal and said to the *durbaris*, "If you fail to seize this opportunity you are not likely to have another." The *Statesman* (August 15, 1917) commented thus on his speech:—"Could there be a more remarkable illustration of the revolutionary times in which we live than a comparison between the recruiting record of Bengal and that of a Sikh stronghold, to the very decided disadvantage of the latter?"

"Chota Sahib" has deliberately refrained from disclosing the reasons that are responsible for Bengal not contributing soldiers to the Indian Army. The artificial and arbitrary division of Indians into military and non-military races which the British have made is the chief reason for Bengal's non-contribution to the Indian Army. The persistent refusal of the Army Headquarters to allow Bengalees to enlist as soldiers in the beginning of the War is a fact which does not reflect credit on those responsible for the administration of the country.

As every road was said to lead to Rome so every fact recorded by "Chota Sahib" has been selected or manufactured to lead to the conclusion—India is not fit for self-government and must be governed by the British. He has not profited by the bitter experience the British had with Ireland, because he would still build "his trust on reeking tube and ironstand" and leave out of his calculations the invincible soul of man. He would have his countrymen believe that the Congress party in India "do not want any form of government at all which will interfere with their programme of lawlessness." And though ignorant or deaf about the actual condition of India and the aims of Indians he has made the following assertion:

"Theorizing with the East is a dangerous game and to attempt to impose Western political conceptions on such a fanatical multitude is like applying a torch to a powder barrel. A rude awakening to these constitution drafters and unless our Government disregard silly sentimentalism and apply themselves vigorously to the duty of governing India in accordance with British ideas of justice and fair play we shall be held legally and morally responsible before God for all the anarchy and massacre that has taken place and which will assuredly follow as so plainly and without any equivocation, foreshadowed by Mr. Gandhi."

Yes, theorizing with the East is a dangerous game when the theory has no foundation in fact and to persist in the Western conception of the inferiority of the Eastern people may result in applying a torch to a powder barrel. And it is strange that this is what

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Mr. R. Rickards said in his appeal to 'the constituted authorities in England'—an appeal made or as far back as 1832 when he said:

"Your institutions must be reformed. . . . They (the natives of India) will soon know that rights and duties are reciprocal; that if you assume the right to govern, duty requires that you should do it, first for their benefit, next only for your known, . . . You have a heavy debt of justice to repay. It will be demanded at your hands, and the opportunity is about to be afforded you of discharging it liberally—with equal satisfaction to the claimants, and immortal credit to yourselves. But if you neglect the opportunity. . . . I say, again, beware! The knowledge now diffused and diffussing, throughout India, will shortly constitute a power, which three hundred thousand British bayonets will not be able to control. That government, which have been so often called a government of opinion, must for the future have some better support than the idea of its military superiority. The natives of India are now in a state to desire your protection; and they will gratefully return the boon, if it be granted with real liberality and justice. The groundwork of the future fabric should be co-operation with the natives in the government of themselves; and for which, under due control, they will be found far better qualified than those to whom it has hitherto been entrusted. But . . . if your domestic policy be a system of expedients, and the object of your foreign policy, military supremacy, the day may not be far distant when you shall feel, in disappointment and disgrace, how feeble is physical compared with moral power; and in the downfall of the magnificent empire of India . . . may add one more page to the proofs given by history, that fleshly arms, and the instruments of war, are but a fragile tenure, and 'soon to nothing brought,' when opposed to the interests, and the will of an enlightened people."

This is what the better minds of England and India have realized and are trying to find out the best constitution which would be consistent with the self-respect of India as a willing partner of the British Empire. But the realization is beyond the conception of "Chota Sahibs" who lack the vision of the statesman and do not know that politics should be treated as a gospel and not as a game.

HEMENDRA PRASAD GHOSE

SANSKRIT

JATAKAPARIJATA: *By Vaidyanath Dikshita with an English Translation and notes by V. Subrahmanya Sastri, B. A. In 2 Vols. Pp. 1360. Published by V. S. Sastri from 50, 3rd. Cross Road, Basavangudi P. O., Bangalore. Price Rs. 13. 2 vols.*

Vaidyanath Dikshita's Jatakaparijata is a well-known treatise on astrology. It may be called a compendium of similar works of earlier astrologers of repute. The original work is in classical Sanskrit, and as it contains many technical terms and aphorisms specially applicable to astrology, it has long been a difficult work for ordinary students of astrology to handle. This difficulty has been reduced to a minimum by the English translation and copious explanatory notes and examples to be found in this edition. The whole work has been divided into two volumes and subdivided into eighteen adhyayas. It first begins with the properties of signs and nature of planets and their properties and ends with the *kalachakra* and *dasas* of human lives. In fact, the work attempts to tackle with every phase of human life and the planetary influences on it and consequent effects. For lovers of astrology this is a valuable work and Mr. V. S. Sastri must be congratulated in bringing out such a good edition of this well-known treatise on astrology. His English translation and explanatory notes will be of great help for a careful perusal of the work and the examples he appends to every section are not only excellent in their character but also assist a good deal in mastering the rules. This edition will prove, no doubt, a helpful and necessary guide to all students of astrology.

SUKUMAR RANJAN DAS

BENGALI

BANGIYA SABDAKOSHA. *Compiled by Pandit Haricharan Bandyopadhyay and published by the Visvabharati. Price of each part 8 annas and postage one anna. To be had of the author at Santiniketan, and at the Visvabharati Book Depot, 210, Cornwallis Street, Calcutta.*

This is an elaborate and comprehensive dictionary of the Bengali language which will be completed in some 4000 pages of demy quarto size. It is being published in monthly parts of 32 pages each, of which 9 have been published. It is the result of thirty years' labour of the author. It contains all words used in ancient, mediæval and modern Bengali books and periodicals and in legal documents, etc., whether Sanskrit or of Sanskritic or Prakrit origin, or taken from Arabic, Persian, Portuguese, English or other languages, with their derivations, etc. The author has given illustrative Sanskrit and Bengali quotations, and, where necessary and possible, Hindi, Marathi, Gujarati and Sindhi equivalents of Bengali words.

When complete, it will be the most comprehensive and authoritative dictionary of the Bengali language. The complete manuscript has long been ready. It is being gradually printed. The University of Calcutta agreed to publish it, bearing all the expenses but could not do so owing to financial stringency. So the author has been obliged to bring it out, depending upon his very limited resources and the expected support of lovers of the Bengali language and literature. Being convinced of the scholarly and useful character of the work, Rabindranath Tagore has helped him by making Visvabharati the formal publisher of the work.

VISVAKOSHA *or Encyclopaedia Indica. Second Edition, compiled by Nagendranath Basu, Prachyavidya-maharnava, with the collaboration of distinguished literati. With maps and illustrations. Published in parts. Priced 8 annas each. To be had at the Visvakosa Press, 9, Visvakosha Lane, Baghazar, Calcutta.*

This Bengali encyclopaedia was completed and published twenty-two years ago. A second edition had long been called for, but could not be undertaken owing to reasons of Mr. Basu's health. But having secured the collaboration of trustworthy scholars, he has at length begun to publish the work in parts. The new edition is a greatly improved and enlarged work brought up-to-date. It must not be supposed that because the work is in the Bengali language and has been named Encyclopaedia *Indica* or English, it therefore relates only to Bengal or India. It is really a universal encyclopaedia in the same sense as the Encyclopædia *Britannica* is one though it is not so elaborate.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Of course, just as British encyclopaedias give more space to persons, places and other topics in which Britishers take interest, than to others so this Indian encyclopaedia gives more space to Indian subjects than to others. But non-Indian persons, places and things are also treated of. For example, in the first 92 pages of the first volume, forming No. 1 of the second edition, there are 21 non-Indian items dealt with, such as those relating to Achaemenes, Achilles, Akkad, etc.

The population of Indian districts and towns are given according to the census of 1931, and their longitude and latitude are given in order to indicate their exact location. Care has been taken to make the historical accounts accurate.

SASTRIYA BRAHMABAD O BRAHMA-SADHAN, *or an Exposition of Religion according to the Upanishads, Bhagavadgita and Brahmasutra. By Pandit Sitanath Tattabhushan. Paper cover Re 1. Cloth Re. 1-4. To be had of the Author at 210-3-2 Cornwallis Street, Calcutta, and of Messrs. Chakrabarti Chatterjee and Co., 15, College Square, Calcutta.*

The author is well known for his annotated editions of the ten Upanishads, the Bhagavadgita the Brahma Sutras, the annotations being in easy Sanskrit and with either English or Bengali translation. He is besides the author of some thirty theological and philosophical books and booklets.

His present work is marked by depth of thought and of lucidity of exposition, and will be found both instructive and insteresting.

RAJARSHI RAMMOHUN. *By Saratkumar Ray, author in Bengali of "Buddist India, "Mahatma Aswinikumar," "Life and Teachings of Buddha." "Sikh Gurus and the Sikhs" "Sivaji and the Marathas" "Sir Gooroodas Banerji", etc. Annas Twelve. Ray & Co., 210, Cornwallis Street. Calcutta. Pp. 112. Six Illustrations.*

This is a well-written popular biography of Raja Rammohun Roy, fit to be read by Bengali children and their elders.

SARIR GATHAN, or *Body-Building, By Praphulla Chandra Sen-Gupta. City Publishing House, Silchar. Re. 1.*

It is a book on the preservation of health and on making the body strong. It devotes some forty pages to physical exercises, with illustrations neatly printed and easily understood directions. In addition there are chapters devoted to *brahmacharya*, food, sleep, bathing, washing the mouth and cleansing the teeth, defecation, cleanliness, dress, dwelling-houses, etc. A useful handbook.

C.

BHARATER RASHTRANAITIC PRATIBHA: *By Sri Aurobindo. Translated by Mr. Anilbaran Roy. Published by the Modern Book Agency, 10, College Sq., Calcutta. Pp. 132. Price Re. 1-4.*

In these days of agitations and cogitations on constitution-making in India it is really a happy sign that Sri Aurobindo should come in with his study on the topic. The book under notice is the Bengali translation of the last few of his essays called "A Defence of Indian Culture" originally published in the *Arya*. In India, politics was not an abstract thing, but an inseparable part of the social and religious system. If we are not to thrust any administrative system from without, we shall have to look for the real problems of India and solve them from inside and this book helps us much in understanding India from inside. There are not a few striking observations made by the author. The power and position of the kings, the king and religion, social organizations and other matters have been considered in a most illuminating way. The author's proposition that India had her own method of unification and that British rule is the *first* foreign rule which has continued in India can not but strike one's curiosity. Before adopting western industrialism and parliamentarism India should pause and think. Mr. Ray's tronslation is commendable.

RAMES BASU

HINDI

GRAM-SUDHAR: *By Pandit Ganesdutt Sarma Gaur 'Indra', Vidyavachaspati. Published by the Madya-Bharat-Hindi-Sahitya-Samiti, Indore. Pp. IV+ 246. 1933. Price Re. 1.*

This is publication no. 41 in the series called "Holkar-Hindi-Grantha-Mala. The subject-matter of the book under notice is the most useful matter of the uplift of rural areas, *i. e.*, rural reconstruction, in modern phraseology. All the various sides of the work have been dealt with in a readable manner. The author has done well in taking up this problem concerning the millions of the agricultural population of India.

BALODYAN PADDHATI KA GRIHA-SIKSHA: *By Mr. Sriram Ramprosad Sarma. Published by Messrs. Jaydev Bros., Aryapura, Baroda. Pp. IV+ 107. Price 13 as. 1933.*

It is surely encouraging that the "Sayaji-Sahitya-Mala" has come to no. 212 by publishing the present work.

This book on kindergarten is based on "Kindergarten at Home" (the People's Books" series) written by two members of the National Froebel Union. The first lessons in the three R's and also manual and musical ones are most interestingly delineated in the small book. This will be welcome both to the parents and the teachers of the youngest of the learners.

RAMES BASU

MARATHI

दीघ निकाय भाग २रा (*Deegh Nikaya Part II. Published by Granth Sampadak Mandal, Bombay. Price Rs. 2-8. Pages 600*).

This book contains the translation of the second and the third parts. This translation was not destined to see the light of the day till 1932. The Marathi translator the late Prof. Rajawade has utilized all the latest research by English as well as German scholars and has added the results of his own knowledge of Vedic literature in the numerous foot-notes. Study of the original with this translation will be more useful than foreign translations, the more so because the Marathi translator can utilize the original Pali words of the cognate Sanskrit and vernacular ones; while this facility is denied to those who translate classical Indian literature into a European language. I heartily recommend this book to those who want to get a first-hand knowledge of the Buddha's gospel. The book contains an introductory note by Prof. Joshi, the successor of the author at the Baroda College.

GUJARATI

ZARTHOSHT NAMEH, *edited by Mrs. Meherbanu B. Anklesaria and Behramgor T. Anklesaria, of Bombay Printed at the Fort Printing Press, Bombay. Cloth bound. Illustrated. Pp. 16+212+136. 1933.*

A Parsi poet of Surat composed this chronicle in A. D. 1674 in that form of Gujarati which was current at the time. It is based on a Persian poem, written about four hundred years before the date of its composition. This particular poet has composed three other "Namehs" also, and they are all remarkable from an antiquarian's point of view. They show how the Parsi writers of the period had absorbed the spirit of the Gujarati Verse literature being written at the time, without sacrificing their individuality, as to their thoughts and their language. The structure is Gujarati, the building materials to a certain extent alien, extraneous. To the Hindu reader therefore, unless there was some one there to guide him, the poems looked to be rather forbidding : but fortunately for one of the poet's works, the father of one of the present Editors, came to the readers' rescue and for the other work— the present one—the son, Mr. Behramgor, has discharged his self-imposed task in an admirable manner. For correcting the text, he has consulted a large number of manuscripts for explaining the thoughts of the poet, he has gone to the original Persian work on which the poet has based his poem, for elucidating unfamiliar phrases and words he has given ample notes. Mrs. Meherbanu has contributed in sixty-eight pages, a commendable synopsis of the life of the Iranian Prophet. Both the editors have tried their best to illuminate the dark corners of the subject. They have consulted nearly two hundred works bearing on the matter in different languages—European, and Asiatic, such as Pahalavi, Persian, Sanskrit, Gujarati, English, French, German and Latin. The editing is a monume research, and a close scrutiny of the work turned by them shows their great assiduity and laborious with which they have worked for the last s years in bringing about this result. We wish scholars take a leaf out of their book. This branch Gujarati Literature requires development, and i sure to come at the hands of such workers.

SIHOR NI HAKIKAT, *written by the late sankar V. Bhatt and edited by Muni Kumar M. B printed under in orders of the Council of Admini tion Bhavnagar at the Saraswati Printing Press, card board pp. 152. Price Re. 1-8-0 Illustrated (193*

Sihor was the capital of the ancestors of the pr rulers of the Bhavnagar State before it was m to Bhavnagar to escape the tyranny of Mar invaders. It is a very ancient town and its h history goes back to the days of king Mulraj o Seranki dynasty when it was given in gift to B mins by him. There are references to it even works earlier than that. The late Mr. Devshan though a school master by profession, had an quarian's inclination and qualifications. He ther set about collecting materials for a Gazeteer of S and the result is this book. Before he could publi he died, and it fell to the lot of the psesent y editor to edit and publish it. One sees in it touch of the modern writer, the spirit of researcher. Although a part of the subject-mat necessarily folklore and tradttion, Mr. Munik has followed certain principles (See p. 17) in s down or rather settling historical facts con with the town and thus tried to change its backgr from a folk-tale one to a historical one. We wel the attempt and call for repetition of such attempt

K.

LONDON LETTER

By MAJOR D. GRAHAM POLE

Political Retrospect and Prospect

THE year 1933 has closed. Everyone is now looking forward to the New Year with hope and expectation of better conditions for trade and employment than in the recent years that have been clouded over by the financial and trade depression. At such a time—one of the most critical in the world's history—one would have thought that Parliament should be in almost continuous session. But Mr. Ramsay MacDonald is never so happy as when the House of Commons is "up" so that he need not be under the necessity of appearing in the House of Commons to answer for his sins of omission and commission. In the old days no one complained more than he of the long adjournments when Conservative Governments were in power. He is now so much one of themselves that he regards long vacations as desirable and the sittings of Parliament as vexations of the flesh to be curtailed as much as possible.

Parliament's Long Vacations

During the last six months of 1933 Members of Parliament certainly could not plain of being over-worked. Parliament adj ed for the summer recess on the 28th July had well over three months' holiday. Parlia did not meet again until the 7th November then only to be prorogued ten days late 17th November. The present session of Pa ment was opened by the King on 21st Nove and went on for exactly a calendar month 21st December, when it adjourned until end of January. Meanwhile there is no M Test for either Ministers or Members and draw their full salaries during the whole of many months they have not been near W minister.

Mr. Lansbury's Enhanced Reputation

It is a calamity, of course, that the Leader the Opposition, Mr. George Lansbury, is

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

side for many weeks with a broken thigh and it is not without interest to note that one of the chief political commentators (not of the Labour Party) in his political review of the year, says that the only British statesman who in the past year has enhanced his reputation is Mr. Lansbury 74 years old and now unfortunately incapacitated for months to come."

A No-Policy Government

The same commentator remarks that the Government's policy at home and abroad has been to wait on events in the hope that events will cover up the defects of their statesmanship. In international affairs, he says, "the Government has acted entirely without understanding, imagination or courage; and it has failed (especially in disarmament and in the Sino-Japanese dispute which brought in its train disastrous European consequences) to utilize even once the great authority which still resides in the British nation."

The Government, he continues, is merely nibbling at the urgent problem of re-housing the poor. It has no positive peace policy and appears still to be almost at the mercy of the most influential of its supporters, who are clamouring for re-armament. Its record in 1933 is a dismal one, is his verdict.

The Premier on Providence

The Prime Minister last week attended a meeting of the Scottish Educational Institute and, speaking to the teachers with reference to the "economy" cuts that were imposed on them by him in 1931, he said: "You and I are long sufferers as a result of one of those curious cataclysms which do not belong to governments, but to Providence...We both expect these lean years to go over as quickly as possible, and we both want to make ends meet in a decent and honourable way."

Providence Gets Blame. Government Takes Credit

We had been told before on hundreds of Tory platforms that the financial cataclysm was due entirely to the Labour Government. Now apparently it is Providence that is to be blamed instead of the Labour Government. The unemployment figures in this country reached their highest point in January 1933. That, no doubt, the Prime Minister would say, was due to a curious cataclysm of Providence. In recent months the unemployment figures have been falling in this country—in common with most other countries all over the world—but not to anything like the same extent as in some other countries. That fall, however, the Prime Minister does not attribute to Providence. In a broadcast speech on 8th December, speaking on behalf of the National Government, he claimed that they had reduced unemployment and increased the nation's power to consume. What he did not point out is that the numbers of the *wholly* unemployed have increased ever since the National Government was formed and are *still increasing*.

He did not point out either that in addition to the registered unemployed there has been an increase of nearly 300,000 in the numbers in receipt of Poor Relief since the National Government was formed—and every statement of the Ministry of Health, quarter by quarter, since the National Government came into office, has shown an increase as compared with 1931 when the Labour Government was in office.

Abundance Turned Into Scarcity

I have pointed out time and again that what we are suffering from is a super-abundance of everything that is necessary for human comfort and well-being. The Prime Minister talks of these "lean years." The chief activity of the present Government is to turn the abundance provided by Providence into an artificial scracity of food supplies in order to raise prices. This is a policy that the Prime Minister, in his regenerate days, would have condemned root and branch. Now he advocates it, and the whole energies of his Government are concentrated on it, while he mocks the intelligence of the people by talking of "lean years". On the contrary, the years are so fat that corn is being burned, coffee thrown into the sea, cotton ploughed into the ground—and the latest example is the abundance of the herring harvest in this country which instead of being welcomed as a gift from Providence, is bringing ruin to thousands of fisher folks at home because of the stupid policy of the Government in putting an embargo on Russian trade and so cutting off the best customer for British herrings.

Burdening the Unborn With Debts

On the 18th December—just about a fortnight ago—the Labour Members in the House of Commons pressed the Chancellor of the Exchequer to give some hope to the unemployed that the cuts in their benefit (which have reduced some of them since 1931 to below the level of decent subsistence) would be restored before long. Mr. Chamberlain, in reply, protested vigorously against the assumption that there was going to be a surplus at the end of the year which would allow the restoration of the general cuts. There is a debt on the Unemployment Fund of about £115,000,000. Instead of adding this to the National Debt Mr. MacDonald's Government has saddled the Unemployment Fund with this debt. The result is that every new employee *for the next forty years* will have to pay part of this debt incurred by past Governments and and for which the unemployed are in no way responsible. Mr. Chamberlain proposes to pay off £5,500,000 a year for the next 40 years out of the Unemployment Fund and calmly tells the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

unemployed that it will be impossible to restore the cuts in Unemployment Benefit so long as there is a deficiency in the Fund ! Forty years ! What a prospect for under-nourished unemployed !

Babies Starved—Bondholders Enriched

Sir John Simon, a day or two later, said the nation was £42,000,000 better off at the end of the first half of the present financial year than at the corresponding period last year. And the Chancellor of the Exchequer himself, speaking in Halifax on the day after he had made his House of Commons speach, said he had every hope that at the end of the current financial year we would have a substantial surplus.

But while Mr. Chamberlain and the National Government profess to be unable to give more than 2/- a weak for the subsistence of an unemployed man's child, they quite calmly handed over to Newfoundland *as a free gift* £550,000 to meet their interest charges which fell due in 1933. They go further and promise Newfoundland further sums that may amount to anything from £1,500,000 to £2,000,000 as a free gift by the end of December 1936.

They have undertaken *in addition* to pay 20/- in the £ to Newfoundland's creditors and take over the responsibility for Newfoundland's debt to bond-holders both in the United States and in this country—amounting to some £20,000,000.

A Vicious and Corrupt Political System

We receive not a penny of benefit for this gift or this guarantee, which is added to the responsibilities of the tax-payers of this country. We do not even get a fair share of the Newfoundland trade—nor is it carried in British ships. It is no wonder that the Newfoundland bonds jumped from about £55 to £100 to the great benefit of Stock Exchange speculators ! The people of Newfoundland only hold about five per cent of these bonds and it is really not helping them at all. It is merely helping the speculators and bondholders. It is not even as if Newfoundland had been struggling against adversity and had gone down in circumstances that were too heavy for her or over which she had no control. As the Chancellor of the Exchequer himself said in the House of Commons on December 7th, the Report on Newfoundland "makes very painful reading" and shows that Newfoundland "has been the victim of a vicious and corrupt political system."

Greed—Graft—Corruption

The fishermen in Newfoundland still live under the truck system under which they recieve no wages but are provided with foodstuffs and other necsssaries in lieu of wages. The Report tells us that large fortunes were made by the merchants who employed the fishermen, who were "little more than serfs with no hope of becoming independent." While they were making huge profits the merchants supported the fishermen, but when times were not so profitable the duty of supporting the fishermen was thrown by them on to the State. The words of the Report are very illuminating :

> "Under this system, which has continued, in spite of criticism and repeated warnings, down to the present day, the merchants were given the chances of making a profit, first on the supplies made to the fishermen in the spring, secondly, on the sale of fish to foreign markets, and thirdly, on purchases by the fisherman from his earnings of sufficient goods to carry him through the winter.
>
> "The fishermen, on the other hand, who have never been given a chance of becoming independent, were deprived of the right to look to the merchants for assistance in bad times and were compelled in emergency to seek public charity.
>
> "The evidence tendered to us from all sides and from responsible persons in all walks of life leaves no doubt that for a number of years there has been a continuing process of greed, graft and corruption which has left few classes of the commuuity untouched by its insidious influences."

And now, not to assist the poor people and fishermen of Newfoundled, but to relieve the bondholders who have made their investments with their eyes open, the taxpayers and the unemployed of this country are to have Newfoundland's financial burden transferred to their shoulders.

If the truth of this great financial ramp could be put before the electors of this country, the Tory Government that masquerades under the title of "National" would be swept out of office for all time.

Simon, Mussolini and the League

Meanwhile Sir John Simon, our Foreign Secretary, has been sunning himself in Italy, beautiful island Capri. On his way there he stopped in Paris and we are told that he managed to reassure the French Government with regard to the British policy in connection with the League of Nations. *The New Statesman* very pertinently says that if that is true, and the French Foreign Office really knows what the British policy is, then it is better informed than the British public.

At present the Foreign Secretary is in Rome conferring with Signor Mussolini. Signor Mussolini has publicly declared his intention either to mend or end the League of Nations. By mending it he means having a virtual dictatorship of the Great Powers over the rest of the world. To try to carry that out would certainly be to end the League.

The Only Way—A World Community

One of the Italian newspapers tells us that the object of the Italian proposals for reform is to create two Leagues, one of the Great Powers and the other of the Minor Powers

It is not so long ago that Mr. Ramsay MacDonald and Signor Mussolini launched the Four-Power Pact, which died a natural death. This seems to be another Pact of the same kind, but with other Great Powers, like the United States and Russia, added.

The only way to make the League really effective is for nations to realize that as individuals give up some of their private rights in the interests of the whole community in their villages and towns, and just as villages and towns give up some of their rights in the interests of the whole national community, so nations will have to be prepared to go to an international court and give up some of their rights of being prosecutor and judge in their own disputes, in the interest of the whole world community.

Times are changing quickly. The world is growing smaller everyday. Telegrams, telephones, and now wireless broadcasting have made the whole world one. A speech, made by the King at Sandringham on Christmas Day, was able to be heard in every part of the world. It seems to be the essence of insanity, at a time of such strides towards world unity, for this and other countries to be erecting more and more trade and other barriers between one another.

The Birthright of Peoples and Nations

The brotherhood of man is a fact. The realization of that fact is slow, but it will come. It must come. And it is that belief that helps some of us to go on working for the under-dog at home, for the freedom and full citizenship in their own country of peoples of whatever race, caste or colour, and for the freedom of every nation to live its own life in its own way—to try to secure, in fact, for every people, the self-determination for which we fought in the War, so that they may have full responsibility for their own self-government, which is the birthright of every people and every nation.

3rd January, 1934.

EARTHQUAKES

By Dr. S. N. SEN

[The terrible calamity that has overwhelmed the sister province of Behar is known throughout the civilized world by now. These awful visitations are all the more terrible because of human inability to forecast them aud thus be in a state of preparedness. There are some who will disagree with this view since there is a claim that an astrologer made a forecast of this particular occurrence. We do not know whether the forecast stated the location, area, intensity, etc., or whether it was one of those vague "hit or miss" predictions of a calamity of unknown character with which our almanacs abound.

As a matter of fact since there are about 10,000 earthquakes every year, (over twenty a day), of varying intensity, taking place all over the world, the mere prediction of an earthquake, without specifying the exact zone, the intensity and the path of the wave, could hardly be said to be of any use.

Science as yet seems to be unable to solve the problem of forecasting earthquakes, as the following notes, kindly supplied by Dr. Sen of the Calcutta Meteorological Office, would tend to show. All that it can do as yet is to record the event together with its various characteristics at the time of the occurrence.—Ed. *M. R.*]

AN earthquake is a result of any sudden displacement of the earth's crust; but the term is usually restricted to movements of natural origin and to those only which take place below the earth's surface as by volcanic operations or by the growth or shaping of the earth's crust. Volcanic earthquakes are those which precede, accompany or follow the operations of a volcanic eruption or are due to displacements within the mass of a volcano. Tectonic earthquakes are the results of the growth or shaping of the earth's crust. There is no essential difference between the nature of these earthquakes save and except that near about the origin, the earthquakes due to former cause are associated with flow of lava, throwing up of ashes, smoke, flame, etc.

The force of attraction exerted by the moon and planets is negligibly small and cannot explain the phenomenon. The occurrence of earthquakes does not appear to be related to the phases of the moon. But it is a fact that earthquakes are more numerous in June and July in India probably on account of heavy rainfall in the hilly tracts which may upset the isostatic balance of the earth's crust.

Probably the Japan earthquake of 1923 was the greatest earthquake ever recorded. Almost similar quakes occurred in Messina in 1908 and in Sicily in 1693.

The maximum speed of the compressional

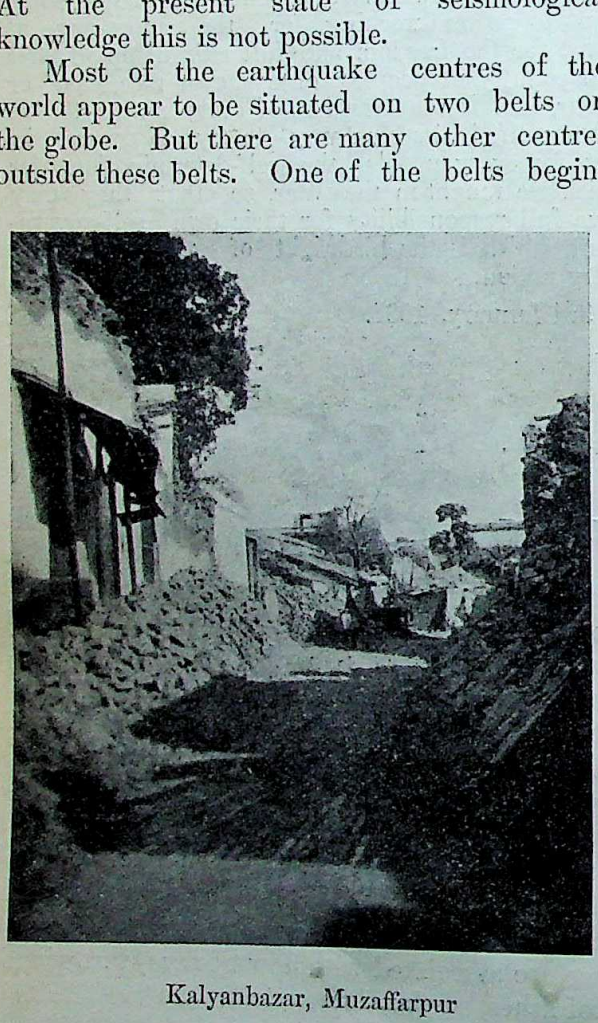
CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

earthquake waves is of the order of 30,000 miles per hour.

If, in remote future, geophysical science can attain such a degree of perfection that man is able to get exact information of the state of the whole of the earth's crust extending to a depth of about 200 miles, the problem of earthquake forecasting may be solved. At the present state of seismological knowledge this is not possible.

Most of the earthquake centres of the world appear to be situated on two belts on the globe. But there are many other centres outside these belts. One of the belts begins



Kalyanbazar, Muzaffarpur

in the south Pacific Ocean near New Zealand, proceeds towards north-west till it comes to the east of China. From here it turns to north-east to Japan and Kamschatka, crosses the Bering Strait and proceeds up to the south-western part of South America, along the western mountain ranges of America. The other belt which is really a branch of the former begins from the East Indies, comes up to the Bay of Bengal and then proceeds over Burma, Assam, the Himalayas, Tibet, Turkestan, Persia, Turkey, the Balkan Peninsula, Italy, Spain and Portugal. It then turns to south-west, crosses the Atlantic Ocean and the West Indies and joins with the first belt in Mexico. Besides these two belts there are important earthquake centres in China and Manchuria, in central Africa, in the western part of the Indian Ocean, in the south Atlantic Ocean and in the Arctic Ocean. The rocky soil appears to be more liable to damage than alluvial soil.

If the intensity at the origin is very great, it can produce disastrous effects at great distances such as 200-400 miles.

On account of the deformation of the earth's crust the subterranean water is sometimes subjected to very great pressure and may be forced upwards. If this water comes from a great depth then its temperature may be high and it may contain sulphur compounds and various other materials locally present in the interior of the earth. Disappearance of water from wells, rivers, etc., may be due to change of level which changes the course of the feeder springs, streamlets, etc. Appearance or disappearance of small islands is due to subsidence or upheaval of the earth's crust.

Sound is produced by the ground vibration which sets the air in vibration.

Deserts and plain tracts of land appear to be less disturbed by earthquakes probably on account of the dead structure underneath.

Duration of an earthquake depends upon the time taken in establishment of equilibrium after a disturbance. The time taken is usually small.

The disturbance produced gives rise to three different kinds of waves which are propagated like the water waves with tremendous velocity. If the disturbance at the origin is very violent, it may be recorded by instruments even in the remotest parts of the world.

The place where the disturbance actually occurs inside the earth is technically known as the focus or hypocentre and the place vertically above it on the surface is known as the epicentre which is commonly described as the origin or centre of the earthquake.

Centre is an area the position of which can be determined exactly by accurate survey after rough seismological determination.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

An earthquake can be localized or be widespread. There does not appear to be any relation between calm periods and earthquakes. There is no truth in the belief that a quake is followed by a storm.

The different kinds of waves of an earthquake are recorded by the seismograph together with some other characteristics.

There are in general three kinds of movement in an earthquake, *viz.*, up and down, to and fro and a twist. All the movements were marked in North Bihar during the earthquake of January 15. The twisting movement becomes feeble as the distance from the epicentre increases. The character of the up and down and to and fro movement varies from place to place.

When the deformation of the crust is excessive, the safe limit of elasticity is passed and fissures appear.

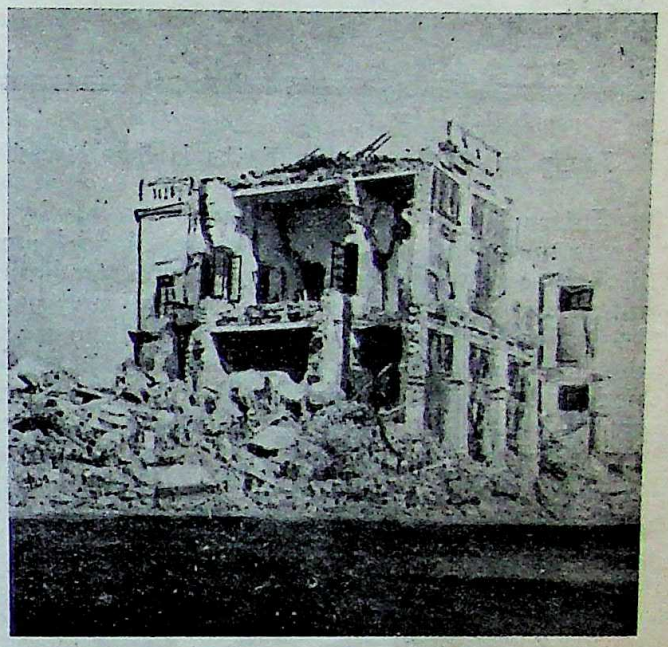
Present Earthquake

Nearly the whole of Northern India and the northern part of the Deccan was shaken by the earthquake of the 15th January, 1934. Probably North Bihar is the centre of this earthquake and the area of greatest intensity lies in North Bihar and Nepal.

Subsidence of the earth's crust probably over a region extending from Nepal to North Bihar, is the probable cause.

Three shocks were recorded at Alipore on the 14th (two of which occurred at night) with epicentral distances 550, 400 and 300 miles. It is not known here whether Madras felt an earthquake shock on this day.

The present disturbance is of tectonic origin. Though it is believed that some portions of the Himalayas and Bihar are really extinct volcanoes, Bihar may experience severe earthquakes from time to time but no assertion can be made as to whether Bihar will ever become a permanent centre of volcanic activity.



Mr. Ashoke Bose's newly-built Bunglow in ruins. Nine miles off Motihari

Feeble to moderate shocks should be felt for some time now and their frequency is likely to diminish gradually. These shocks show that after subsidence internal accommodation to new conditions is taking place.

Volcanic and tectonic movements are the forces that are mainly responsible for most of those wonderful natural sceneries that we admire. Besides a large number of the minerals that are of great economic value to mankind also have their origin in these movements. But all these considerations are poor consolation to those that have suffered, and are suffering, from the results of the recent catastrophe.

Lamp for Internal Sun Baths is Swallowed by Patient

Internal sun baths are made possible by a device produced by Dr. Joseph Mandelbaum, bronchoscopist. It is a tiny gas lamp, radiating ultraviolet rays after it has been swallowed painlessly by the patient. The sun rays may be directed exactly upon the diseased spots for periods up to three minutes. Treatment of this type is expected to be of aid to the medical world in its fight on tuberculosis.

How internal Sun Bath is administered to Patient by means of Tiny Ultraviolet Lamp

An Uncomfortable Royal Bed

The ancient Egyptians had good furniture, they drank wine and beer, used cosmetics, and were generally up-to-date but when it came sleeping, a contraption that looked like oar-lock was the torturing pillow. The illustrated is in the Boston Museum; it reproduced from the original in the Museum. The bed slopes and a foot board the mattress from sleeping off. The origin cased in gold, belonged to Queen Hetep-He I, mother of Cheops.

Human Bullets Raise speed on Land and in Air

When James R. Wedell flew his racing plane to a new world's record of more than 305 miles per hour at the Chicago air races a few weeks ago, he set a new mark for speed kings of the world to shoot at in their unceasing struggle to go faster and faster on land, in the air and on the water. Human speed today compares favourably with that of a bullet, and there are those who see man winning a race with the sun when he begins to fly in the stratosphere—and France is already building a plane for that purpose. The Italian seaplane which set a record of more than 424 miles per hour—over seven miles a minute—went as fast as some types of pistol bullets, but could hardly keep up with a bullet from a United States army pistol which has a muzzle velocity of 545 miles per hour. Sir Malcolm Campbell has traveled more than four and one-half miles per minute in his racing car and Gar Wood has driven his speed boat more than two miles per minute. If man succeeds in doubling the highest speed he has yet reached—that of the seaplane—he would be in a position to stage a race with the sun. The speed of the sun—actually the earth's rate of rotation—is something over 1,000 miles per hour. If man could approximate this speed, he might start from New York at noon and reach San Francisco at noon the same day—in nothing flat. With the French plane, the backers claim it should easily be possible to attain a speed of 500 miles per hour at an altitude of twelve to fifteen miles, and the more optimistic claim if such a speed is attained with the first stratosphere plane, there is no reason why it cannot be increased through changes learned by experience. Tests have indicated that there appears to be no limit to human endurance in straightaway speed so far as physical injury is concerned. For stratosphere flying, naturally, the pilot would be in a sealed compartment with an artifical supply of oxygen.

INDIAN PERIODICALS

A Poem by Tagore

The following poem by Rabindranath Tagore appears in *Visva-Bharati News* :

KRISHNAKALI

I call her my Krishna flower
though they call her dark in the village.
I remember a cloud-laden day
and a glance from the eyes of my girl ;
her veil trailing down at her feet,
her braided hair loose on her back.
Ah, you call her dark ; let that be,
Her black gazelle eyes I have seen.

Her cows were lowing in the meadow,
when the fading light grew grey.
With hurried steps she came out
from her hut near the bamboo grove.
She raised her quick eyes to the sky,
where the clouds were heavy with rain.
Ah, you call her dark ! let that be,
her black gazelle eyes I have seen.

The East wind in fitful gusts
ruffled the young shoots of rice,
I stood at the boundary hedge
with none else in the lonely land.
If she espied me in secret or not
She only knows and know I.
Ah, you call her dark ! let that be,
her black gazelle eyes I have seen.

She is surprise of cloud
in the burning heart of May,
a tender shadow on the forest
in the stillness of sunset hour,
a mystery of dumb delight
in the rain-loud night of June.
Ah, you call her dark ! let that be,
her black gazelle eyes I have seen.

I call her my Krishna flower,
let all others say what they like.
In the ricefield of Maina village
I felt the first glance of her eyes.
She had not a veil on her face,
not a moment of leisure for shyness.
Ah, you call her dark ! let that be,
her black gazelle eyes I have seen.

Western Tibet

In the same paper Angarika Brahmachari Govind describes his journey to Western Tibet thus :

Though I have been travelling a great deal in my life, I must say that my journey to Western Tibet (Ladakh), from where I returned about two months ago, has been one of the most interesting trips I ever made. Not only the nature of the country and the life of its inhabitants but also the way of travelling was in itself a thrilling experience. In this age of railways and motor cars we hardly can imagine a country in which the wheel, even in the primitive form of the simplest bullock cart, is absolutely unknown because there are neither roads nor bridges on which it could move. There are only small paths, just sufficient for men and horses, so that one can only choose between travelling on foot and horse-back. One has absolutely to rely on one's strength and resources, and to face nature in all its moods. As there are mostly no houses where one could stay at night, one has to make the open sky one's home. In the first month I had not even a tent because I was told that there was no rain in that season and very soon I became so used to the open-air life that even if I got a chance to stay in a house, I preferred to sleep on the roof. Certainly sometimes it was not altogether agreeable : for instance, when crossing the Great Himalayan Range in snow and rain or enduring icy thunder-storms at the shores of the great salt lakes on the Tibetan highland. But such small travails meant nothing compared with the overwhelming impressions of nature. Most people think that Tibet must be a horrible country, because it is barren and desertlike. But they forget that colours can turn the desert into a fairy land, and in fact Tibet is one of the most colourful countries in the world. The lakes are blue and green like saffron and emerald, and the mountains bright as gold and sometimes flaming red of shining amethyst colour.

In such a fantastic setting monks and mystics of olden times built their hermitages, which later on became sanctuaries and monasteries. The study of these places was my main purpose. I visited about twenty monasteries and found a great deal of important iconographical material, specially about the old Indian *siddhas* (mystics) who lived mainly between the 7th and the 11th century A. D. They belonged to the Tantric school of Buddhism. Some of them have been great poets and it was they who for the first time introduced the spoken language into Indian literature. Before that time Sanskrit was practically the only written language. Even the Buddhist [illegible] abandoned Pali in favour of Sanskrit. Thus the *siddhas* were the first Hindu

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

poets, the father of modern Hindu literature. Unfortunately India has nearly completely forgotten what it owed to these men, and only a few names like that of Saraha, for instance, had survived. But fortunately while the last traces of Indian Buddhism were swept away by the Mahomedan invasion, the records of the *siddhas* were carefully preserved in Tibet. Parts of their works were translated into Tibetan, their life-stories collected in a special volume of the scriptures, and their pictures engraved on stones or painted on the walls of the monasteries.

The pictures I found were engraved and painted on stone slabs. Mostly the old painting had gone and they had been overpainted in later times. But I was able to trace the old engraving underneath and to restore those parts which have been damaged through the influence of the climate in course of centuries. Thus I returned with a complete collection of pictorial representations of the eighty-four *siddhas*, which I hope to publish soon, under the auspices of Visva-Bharati.

—

Forests in India

On the importance of forests in India Mr. Rabindra Mohan Datta, M. SC., writes in *The Indian Review* :

Forests are the most valuable natural assets of India. Their character depends upon soil, rainfall, elevation and other natural circumstances. But their distribution is greatly affected by action of Man. Man is responsible for the absence of forest trees over enormous areas which have been cleared for cultivation, or more slowly destroyed by reckless feelings.

It has been the uniform experience of all countries that the natural processes of growth and reproduction by which forests are kept alive, are incapable of keeping pace with man's destructiveness; and the State has generally found it necessary to take special measures in the ultimate interests of the country for preserving its forests from reckless destruction. Forests, being valuable national assets, their proper conservation is one of the most important economic functions and duties of the Indian Governments.

The process of reckless and ceaseless destruction of forests went on from time immemorial in India, but its evil effect was not felt because of the thinness of the population, and because the primary forests remained practically untouched and also partly because the Hindus would not cut down certain classes of trees on account of their religious scruples. The effect of the general increase in population first manifested itself during the later Mughal period, but the Mughals, either because of ignorance or being too engrossed with their tottering thrones, did nothing to prevent the destruction of primary forests. In the earlier years of the British rule this destruction became more progressive and rapid on account of rapid increase of population and consequent extension of cultivation. Lord Dalhousie first became alive to the necessity of stopping reckless de-forestation and, in 1855, he laid down the foundations of a definite and far-sighted forest policy, The Mutiny delayed the progress, but from 1860 forest administration was rapidly organized and developed; exploration, demarcation and settlement, followed by efforts to introduce protection and some form of regular management. Work on these lines is not yet complete and the work of replacing destroyed forests is only camparatively recently taken in hand. In 1894, the Government of India laid down a definite forest policy and divided forests into the following four classes :

(*a*) Forests, the preservation of which is essential on climatic or physical grounds. They are usually situated in hilly countries where the retention of forest growth is of vital importance on account of its influence on the storage of the rainfall and the prevention of erosions and sudden floods, etc.

(*b*) Forests which supply valuable timber for commercial purposes, such as the *sal* forests of Northern and Central India, the deodar and pine forests of the N. W. Himalayas.

(*c*) Minor forests, containing inferior timber-producing materials for local consumption—these areas are of great importance to agriculture in the adjoining districts.

(*d*) Pasture and grazing grounds proper which are forests in name only.

The Indian forests play an important rôle as suppliers of the necessary raw materials to various industries, and providers of employment for large numbers of people. Forests products may be divided into two main heads: (*i*) major produce, *i.e.*, timber and fire-wood; and (*ii*) minor produce, such as lac, tanning materials, essential oils, turpentine, resin, etc. The minor products are increasing in importance, and many of them have already established themselves in the markets of the world.

Although the principal function of Forestry is the preservation and development of forests we must never lose sight of the fact that it is also an important vocation as the handmaid of agriculture and industries. It is for this reason the Royal Agricultural Commission recommended (*i*) appointment in each province of a forest utilization officer whose main function would be to develop forest industries—a matter of great importance to agriculturists, especially to those who live in the neighbourhood of forests, and (*ii*) a reclassification of forests into a major division consisting of commercial forests and those necessary on physical and climatic grounds, and a minor division consisting of minor forests, fuel plantations, village wood-lands and waste lands. They also suggested close co-operation between the Agricultural and Forest Departments.

What is worth Saving in European Civilization ?

Professor Jean Guehenno, the editor of the French International Review, *Europe*, has contributed a thoughtful article on the above subject to *The Aryan Path*. Part of this is quoted below :

Christianity is dying. Let it die, for it has ceased to nourish our souls. Once upon a time it helped us to become aware of our own souls, but now it has degenerated into a second-rate market of passion and self-interest. Too often it justifies the world we live in. Compromises, conciliations are killing it. But even while Christianity is dying, something else is rising in its place, a Religion of Man, every day more demanding, every day more clearly defined. Nothing is more touching than the story of its development. I only know it as far as it has affected the small *canton* in which I live, but I am sure that in all the provinces and in all the literatures of Europe one can find sentiments and phrases akin to those I am about to quote.

I find the first notes of the new faith struck in the writing of Senancour and Benjamin Constant. "In a world of mingled pleasure and pain," declares Senancour, "it is incumbent upon man to increase joy, to fructify expansive energy and to oppose in all sentient beings whatever tends to degrade them or to promote suffering." Thus the man of Europe, becoming aware that he stands upon an earth subject to infinite vicissitudes and beneath a heaven which is deaf to his prayers, realizes that he is alone and that his only resource is within himself. But this very thought gives him back all his courage : Man has no other Providence than man.

In the enthusiasm for their new faith Europeans have not thought that circumstances may be stronger than man. They overlook the insolent manner in which the things go their own way, and they fancy that man is master. But now, intoxicated by our power, we have no longer the capability of regulating it, just as a disordered heart cannot control its pulsations. Thus "things" have taken their revenge. In this disillusionment, the slow conquests of reason do not satisfy us. We demand a miracle ; we want history to read like a novel, and so once more we hand over to some outside agent—some saviour or tyrant—our lives and destinies which at one time we were so proud of ruling.

I cannot here enumerate all the causes of our failure, and I take up once more my main theme. It does not seem to me that our troubles—not even the Great War itself—point to a complete failure. All that is worth saving in Europe, all that she has ever offered that is useful or noble, may be found in the formulæ and examples of a revolutionary humanism, at once humanism, at once clear and bold. But the important question is whether such a humanism will win through or be crushed.

There is no difficulty in classifying the parties and doctrines which actually divide Europe. The great line of demarcation lies between a dream of happiness and a dream of dignity and self-respect. I am not scorning happiness, I am sure that happiness is one of the main pillars of self-respect ; but if Europe is ready to sacrifice her honour to happiness, she will have lost the faith which made her greatness. Even now, our masters, those who hold sway over the material part of our civilization, declare themselves able and willing to furnish the masses, who have so long desired it, with a certain amount of happiness ; they promise a peace and security such as has never before been known, provided the masses hand over absolute and complete control of *everything* to these masters. Europe is full of dictators ready to manufacture happiness for people, but they will do nothing to maintain the people's self-respect. And why ? Because such men are not afraid of happy people, whereas they dread those who are animated by a sense of human dignity.

Which dream will prove the more powerful, that of happiness or that of self-respect. The "masters" are ready to degrade the masses ; they are willing to amuse and to feed them, and so we have Americanism, Rationalization, Fascism,—a return to I know not what dark age. Shall we be content with the lot of happy slaves, or shall we maintain that the only happiness worth having is that which we have won for ourselves ? Are we strong-minded enough to refuse, if we must, the offered *panem et circenses*, for the sake of a happiness and glory that we alone can conceive ? Thus only will Europe be justified ; thus only will she save her faith. Her destiny depends on our courage.

—

The Lancashire-Bombay Textile Agreement

While consultations on questions of trade between India and Japan were being carried on, the Bombay cotton interests rushed into an agreement with those of Lancashire in spite of opposition from other parts of India. Mr. Krisna Kumar Sharma comments on this agreement in the *The Mysore Economic Journal* as follows :

The principle of imperial preference against which Indian opinion is solidly unanimous has been willingly endorsed by the Bombay cotton interests without obtaining any economic concession from the other side. Their own utterances on former occasions have been exactly contrary to what they have accepted now.

On the one side, representatives of Bombay cotton interests are forming currency leagues to

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

get the ratio changed and clamouring for more and more protection and on the other, they are lavishly and with a magnanimous and generous hand bestowing concessions upon Lancashire. They favour reduction in wages, grudge a reduction in the working day to the worker and penalize the consumer. Why then should they grant concessions to their competitors without any *quid pro quo*? Either protection is necessary for Bombay cotton industry or it is not. If the former is the case, such concessions are utterly unjustifiable, and if the latter, the Government should in bare justice to the consumer withdraw all protection or reduce duties on goods entering Bombay port only. This agreement has been denounced by nearly all important Chambers of Commerce in all parts of India.

How the Government of India will view an agreement made by a section of the industry in spite of protests from other equally important interests is difficult to forecast. One thing is, however, certain and that is that any step taken by the Government to enforce the agreement will be against the best interests of the country. The production of Indian mills can meet the total home demand and an increase in imports will, therefore, be against the interests of the Indian cotton mill industry itself. It will mean closing down of more mills, increased unemployment and reduced wages. Less of Indian cotton will be consumed, hand-loom weavers will be hit hard by severe competition and it will be extremely difficult for Indian mills to diversify the styles of production, specially those which have to face the competition from Lancashire. An unfavourable move at this stage of India's industrial advancement would be really very unjustifiable.

—

Laboratories of Reconciliation

Mr. Richard R. Wood writes about the function and achievements of the Society of Friends in *India and the World* thus :

With the increasing excitement in European politics, the Society of Friends is facing a heavy task.

The Society of friends is a pacifist Christian sect. The essential feature of its religious philosophy, the feature that set it apart as distinctive in Seventeenth Century England, at its origin, is the belief in the "Light Within." Each human being may enjoy direct immediate experience of fellowship with God. There is in every human being a Divine spark, which can transmit the glory of God to that soul. This spark is often referred to as "the seed of God," indicating the belief that it contains possibility of growth.

Conditions may prove unfavourable to the seed; economic or social environment may be inhospitable; disease of mind or body may check its development; sin and selfishness may hamper it. But in every human being it is present. No matter how unpromising, there is about every person something Divine.

Pacifism is a necessary corollary of this principle. This Divine element in every human being demands respect. You simply cannot respect it while doing to its human container the things that men do to men in war. Therefore participation in war is inconsistent with Quakerism.

It should be noted that this same process of deduction leads members of the Society of Friends to concern themselves with the emancipation of slaves, with justice for American Indians and subjugated peoples generally, with the emancipation of women, with temperance, and with social justice. Rather gradually, as abuses develop and come to be recognized as abuses, Friends grow uneasy about them, and try to correct them. Sometimes recognition is slow. Friends have only very recently come to concern themselves with the question of social and economic justice for the American Negro. For nearly two generations after the emancipation of the slaves, Friends were content to aid in their education, but failed to note the importance of establishing normal friendly relations between whites and Negroes of equal cultural attainments.

At present, one of the tasks of the Society of Friends in Europe is to seek to check the spread of anti-German feeling. There is no hope for Western civilization if we are to blame all our troubles on the Germans, and pummel them instead of setting about correcting the evil. Patience, sympathy, understanding, love for people even while disapproving their views and their actions, are what the world desperately needs. In the past people who have courageously acted on the assumption that the Divine spark resided was present in both sides of a bitter quarrel have accomplished apparent miracles of re-conciliation. We believe that our principles are equally effective today. We do not feel confident of our ability to apply them effectively. Perhaps some young souls will arise to give a lead.

—

The Plight of the Indian Agriculturist

Mr. D. G. Karwe writes in *The Bombay Co-operative Quarterly* :

It is usual with the supporters of the present high ratio [18*d.*] to make out that any downward movement of the rate of exchange will adversely affect the interests of the wage-earners, the salaried and the professional classes and of the public revenues. The actual experience of the last few years constitutes a thorough exposure of the hollowness of those arguments. It is quite true that a scaling down of the ratio would be followed by a comperative rise in prices. But it is wrong to argue on the basis of the supposition that all increments in prices are definitely detrimental to the permanent and legitimate interests of the above-mentioned classes. If the price

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

is lowered as the result of an unwarranted heightening of the exchange rate not only the producing but also the wage-earning classes have to bear the evil consequences. If the producers are forced to market their goods at unremunerative prices, they are compelled either to reduce wages or to give up business. In both cases the wage-earners suffer in the end at least as much as the producers. The position of the professional and salaried classes is not essentially different. The demand for their services falls off, and as the public or private employers experience a shrinkage in their revenues they have to resort to curtailment of staffs and retrenchment of salaries. Even the contention that with a lower ratio the Government of India's finances will suffer a net loss on account of an increased rupee equivalent of its home charges is a half-truth more dangerous than a stark untruth. What the Government might lose in increased expenditure on this account it will more than make good on its revenue. A straitened peasantry, an unemployed and impoverished middle class, and a losing industrial and mercantile community are certainly not the best tax-payers. Railways, income-tax, posts and telegraphs, even salt—all these are beginning to yield lesser returns, and the Government has been led on to impose such arbitrary levies as the recent 25 per cent surcharge on all sources of central taxation. There are innumerable avenues of retrenchment in Government expendiure, such as the revision of exhorbitant salaries. Any policy that would sacrifice the first interests of the national producers to the immediate needs of the year's revenue is in a line with killing the goose that lays the golden egg.

The plight to which the nation at large and particularly the agriculturists have been reduced during the last few years is too pitiable for words. It is only the innate passivity of the Indian people and the utter isolation from the life of the people in which supreme governmental authorities live and shape their policies that have prevented the mobilization of social sympathy in support of the great national interest. To the extent to which the agriculturist consumes his own produce and pays for others' services and goods in kind the fall in prices has not adversely affected his lot. The extent of payments in kind is, however, very narrow and even in areas where cultivation is principally for subsistence a considerable portion has every year to be marketed for the purchase of services and commodities, as also for the payment of such fixed dues as interest, taxes and loans. In the case of the growers of commercial crops, *e.g.*, cotton, sugarcane, oil-seeds and jute the fall in prices has hit the producers with special severity. In many parts of the country rents are fixed in money and the leases are executed for a number of years at a time. In these places the tenants find it impossible to meet the demands of the landlord. Arrears, indebtedness and privations are the inevitable outcome of such a situation which is extremely embarrassing both to the tenants and the land-owners. It is well known that the rates of interest are exceptionally high in India and that their level is determined by the customs of the trade and the position of the borrowers. With reduced prices not only does the cultivator find it difficult to meet his old interest and instalment obligations but any new borrowing is well-nigh impossible except at ruinous rates. The co-operative banks which have their dealings with the cultivator members have latterly experienced almost insuperable difficulties in making recoveries. Indeed, there are not a few co-operators who almost fear the worst in many areas. The Government demand for land revenue is theoretically based on averages of prices over a prolonged period and the land revenue codes do not ordinarily allow of remissions and suspensions on account of a fall in prices. We know how very wooden is the system of administration in India. It is extremely difficult to secure for the people even such concessions as have been provided for by law. It would be hoping for a miracle to expect that the Government would run to the rescue of the landholders in an emergency not falling strictly within normal official operations. In fact, in spite of the loud and heart-rending protests of the landholding classes the collections of land revenue have been effected with the usual rigour in almost all parts of the country. Any one who has the slightest acquaintance with country areas, knows full well that while the government caravan proudly passes by as though nothing has happened out of the ordinary, the farmers, the land-owners, the *sowkars* and the co-operative societies are on the brink of an utter collapse. The standard of life in rural areas was never very high; the present conditions constitute a degradation which is beyond parallel.

FOREIGN PERIODICALS

Why a Federated World ?

For permanent peace, prosperity and security we need a federated world. Mr. Dudley W. Woodbridge explains this in *World Unity* as follows :

First : Security. "It is none of any other country's business how large a navy we have." Is it any of our business how large a navy other countries have ?

In order to be secure in a world governed by force it is necessary for one's country always to have a superior force. It is equally necessary for every other country (if it wishes to be secure) to have a superior force. But this is impossible. However, if there were *one* superior force on a world scale, and that force should be used in such a way as to support liberty under the law for international relations it would then be possible to have a permanent righteous peace.

"Trust in your own right arm." How far would that principle protect an individual ? What is more uncertain than the outcome of a war ? A single diplomatic or military blunder might easily change the result from a so-called victory to an inglorious defeat. Besides, what profiteth a bully to win twenty fights if he loses the twenty-first, and what profiteth a nation to win twenty wars if it loses the twenty-first ?

The world has long taken and should well remember the risks of war and international anarchy. Is it not time to take the risks of peace backed by a righteous superior force ? Could the United States exist today if it had not taken this latter risk ?

Second : Justice. It is unfair to allow each country to determine the righteousness of its own case with the implication always in the background that if the other countries do not like it they can fight. Might does not make right, but right cannot triumph unless it is backed by might. All intelligent people the world over should devise ways and means whereby international right will be backed by might just as every civilized government attempts to do within its own boundaries.

Third : Co-operation. Fighting begets fighting. Mutual co-operation begets good will. Economics, justice, education, art, science, religion—all that is most worth while in life—know no artificial international lines. It is not sentimental twaddle, but basic truth, that mankind as a whole has far, far more in common than it has apart. Those of us who appreciate this fact are building on the rock. Those of us who do not, are building on the sand—and when the storm comes great will be the fall thereof !

—

The lot of Newspapermen in the U. S. A.

Under the Roosevelt régime the Press has got a code in the U. S. A. The newspaper interests put up a strong opposition when it was passed. In this connection many things regarding the hard lot of newspapermen in the U. S. A. have come to light. Mr. Chester T. Crowell, himself a journalist, writes in *The New Republic*.

I recall that when I was employed as a cub reporter on The San Antonio Express of San Antonio, Texas, I was informed that my wage would be seven dollars a week and my hours from half-past noon until midnight, with Sunday off. I worked one year without a day off. My hours were from half-past noon until half-past two o'clock the following morning, which is to say fourteen hours a day seven days a week. From time to time I would get so tired that I simply could not stumble down to the office and would spend the day in bed. I was always docked for the lost day. This condition was common among newspapers outside of the very largest cities, and to a considerable extent still is.

Any worker in the editorial department was expected to give two weeks' notice when he wished to resign, and to the best of my knowledge all did during the sixteen years that I spent in newspaper work, but only a very few newspapers ever gave notice when they discharged a man. He simply came to work and discovered that he was not wanted that day or any other day. Some of the more humane publishers had been troubled by the suffering this caused. They were also moved by the annoyance to their other employees when discharged men hung around trying to borrow small sums with which to buy food, and the more progressive discovered a remedy. They would pay a new man his wages for the first two weeks so that when he finally left, usually discharged, he would get the two weeks' wages that had been withheld. This custom was common in the Middle West for a quarter of a century and, I think, still is. I have been told that it was initiated by The Kansas City Star and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

have heard it highly praised by newspapermen unaccustomed to such thoughtfulness from publishers.

The first time my pay was ever cut on account of hard times (and the times really were hard) I walked into the business office and was handed my pay envelope and discovered to my embarrassment that it was 10-per cent short. I mentioned this fact with some trepidation because I assumed it to be a clerical error likely to cause a great deal of trouble. But the cashier calmly informed me that it was no error at all; wages had been cut 10 percent. No one had been told anything about this. The heads of the institution were as gentlemanly a group as I have ever known in the newspaper world. What they did seemed perfectly natural to them because no one had ever heard of such a thing as an editorial-department labourer having any rights. I announced at once and in no uncertain terms that I would have the rest of my money instantly or I would start a campaign of throat-cutting that wouldn't leave manpower enough around the place to get out a newspaper. Then I took my missing 10 percent and went upstairs to gather up my few belongings and go elsewhere to seek a job. But no one was angry with me and everyone who knew anything about what happened was amused. They put me down as a hot-headed kid from Texas who had no idea of the economic and social amenities of newspaperdom. I tried to explain that they would have a perfect right to cut my wage for the following week if they so elected and would give notice, but that to cut for the week already past seemed to me precisely like stealing. Well, that *was* funny.

Nevertheless I declined to get to work until assured that I would receive my full wage the following week. They actually argued with me that to quit then and there was very, very wrong. I should give two weeks' notice. But I wouldn't so they promised that my wage wouldn't be cut, and it wasn't.

Since then my wages have been cut because of business conditions several times and never once with advance notice. I do not know what experience others may have had with wage cuts, but certainly I never have been notified one second in advance. Usually the printers would know what the situation was because the publisher generally made the mistake of going to them and asking them to postpone pay day. They never did. And the result was that the publisher found the money to pay them. I have also seen pay day pass by with no pay envelopes distributed, but I have never been informed of this coming event by a publisher nor have I ever heard from one under such circumstances one word of apology, explanation or regret.

The reader will please keep in mind that none of this refers to New York City, Chicago, Philadelphia, Boston or any other of the major cities. If it did, I should not consider it worth writing; I am telling what I know of the general run of newspaper employment where the vast majority of newspapermen in this country are working, in the medium-sized and smaller communities.

I have been managing editor, city editor, chief editorial writer and star staff man repeatedly but I never at any time made the amount of money ordinarily earned by a union printer on those very newspapers at that time. It always amused me when publishers took it for granted that I hated union printers as much as they did. They assumed that I would dislike the printers because they received larger pay envelopes than mine. Well, they were wrong. I didn't. I envied the printers. They, too, had been wondering tramps only a decade or so before I entered newspaper work, but now they could actually buy homes on the instalment plan, while in the editorial department I saw, month after month, the procession of brilliant young men wending their way from nowhere to nowhere, stopping a while but never calling the place home. Those who were going to amount to anything got out.

One more story of newspaper work and wages and I close. This is such high comedy that I should hesitate to tell it if every person involved were not still able to testify. A friend of mine was sent as staff writer to Mexico City to do a series of feature articles, but revolution broke out suddenly so he gave that his attention instead. In the midst of the turmoil he found himself in the cable office with shells exploding all around him and, for that matter, over a considerable part of the city. He couldn't get out, but what a stroke of luck to be marooned in the cable office! He remained there for a week with the artillery busy all that time. No other newspaperman could reach the place. He scooped the world and his paper sold his dispatches to many other newspapers, garnering thereby much profit. It also did a prosperous business in extra editions. On his return, however, my friend found himself unable to make out his expense account because he had sent messengers through shell fire to get food at all hours of the day and night. He had had almost no sleep for a week and he was a nervous wreck. Being a painstaking, meticulous person it grieved him to discover that neither notes nor memory would account for all of his expenditures, so he went to the business manager and confessed that there were still fifty dollars to be itemized, fifty dollars that he had certainly spent, but couldn't remember.

"That's all right, my boy," said the kindly chief executive. "You did a grand job and we appreciate it. We will not take the fifty dollars out of your first week's salary because that might leave you short. We will just take it out five dollars a week, for ten weeks, so you run along and don't give it another thought."

Japan's Manchurian Blunder

There is perhaps a widely entertained belief that Japan will find in the control of Manchuria an early solution to her most pressing economic problems. But an analysis of the prospects, says Mr. Ben Dorfman in *The New Republic* leads to a contrary conclusion. He writes :

Immediately following outbreak of hostilities in September, 1931, there was fanned into full flame an anti-Japanese boycott of unprecedented proportions and effectiveness. Japanese steamship lines, banks, manufacturers and merchantile houses were forced either to suspend or limit operations in China proper and in regions in the South Pacific where Chinese dominate business. Industry and commerce in Japan were likewise upset.

Japan's international credit rating was lowered, her gold-dollar bonds dropping in New York by almost 50 percent within the first eight months of the conflict. These bonds have recovered considerably, but despite this, Japan's credit abroad remains so bad that she cannot borrow except at ruinous rates. This is particularly significant as Japan has never repudiated a foreign financial obligation, a record second to none in the world.

Within three months after the outbreak of hostilities, Japan was forced to abandon the gold standard. The yen then began to drop until it had depreciated to about 40 percent of its former gold value, a position from which it has not recovered. Even though Japan had not embarked on her continental adventure, she probably would have been forced to follow Great Britain in abandoning the gold standard. It is doubtful, however, that the yen would have dropped so far as it has, had it not been for her military operations in China.

It should be clear that many of the internal and external difficulties growing out of the extremely low value of the yen are to be traced to Japan's military activities in China. The extreme depression of the yen has imposed heavy burdens on Japan in paying for her imports and in meeting the charges on her foreign loans. To an extent it has stimulated exports, but this has not been an unmixed blessing, in view of the general —but not always well founded—charges of "dumping" lodged against her. This is serious, for many of her best customers, China, India, Egypt, Malayasia and sections of Africa, for example, are beginning to restrict imports of Japanese goods. That Japan has not suffered more from her depreciated yen, is due only to the cushioning effects of the depreciated pound and dollar.

As to the costs of Japan's military operations in China, reliable figures are not available—if for no other reason than that the operations have not yet ceased. It is scarcely to be doubted, however, that her costs in "blood and treasure" have exceeded what she has made in Manchuria to date.

From the opening of hostilities in September 1931, to the present, Japan has undergone many hardships and her people have made many sacrifices. These have been offset in part by certain gains, but without question, the aggregate of losses during this period has more than offset the aggregate of gains. I doubt that any Japanese would dispute this.

At the moment, Japanese-Manchukuo trade is exceptionally brisk, but the basis does not promise to endure. Japan is expending and investing heavily in Manchukuo ; her highly depreciated yen is giving her an advantage over domestic and foreign competition ; and the reciprocal trade restrictions between China and Manchukuo are playing in her favour. Once she discontinues making these expenditures, which she can ill afford in her present financial state, and once Manchukuo's economy is adjusted to new local conditions, the present basis for this unusual trade will disappear.

For some time to come Manchuria will be of only slight assistance in solving Japan's population and trade problems. There is no prospect whatsoever for mass emigration ; and Manchuria's resources do not give promise of early or great Japanese industrial and trade expansion along economic lines. Further, Japan's manner of gaining control of Manchuria has injured her trade opportunities and credit standing in certain important areas ; and the costs of gaining this control have seriously threatened her financial stability. With a more judicious handling of the Manchurian problem, Japan was destined to gain much of what she will obtain in Manchuria and *in so far as net economic gain is concerned* she could easily and might wisely have spared herself the cost of the entire venture. She may get more out of Manchuria economically than she otherwise would have, but this possible gain has been bought too dearly.

—

The Negro and the Court of Justice

Even a schoolboy knows something of lynching practised on the Negroes in the U. S. A. *The New Republic* (December 13, 1933) comments editorially on the glaring injustices done to Negroes even in the courts of justice. It writes :

The first trials of the Scottsboro cases were conducted amidst such glaring injustices to the defendants that the United States Supreme Court set aside the verdicts. In the second trial, Judge Horton, who presided, also set aside the verdict of guilty after only one of the defendants had been tried, on the ground that the decision of the jury was a palpable miscarriage of justice. When the new series of trials began a fortnight ago in Decatur, Alabama, every honest and intelligent Southerner must have hoped with all his

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

that this time the trials would be conducted in such a way that there could be no question of the fairness of the proceeding and that the honor of the South in a question of justice to Negroes charged with a serious crime, which has been so seriously questioned throughout the world, would be vendicated. Unhappily, the conduct and result of the first case have given exactly the opposite result.

Judge Callahan, who supplanted Judge Horton in presiding at the new trials, has seemed singularly insensitive to the fact that the eyes of the world were upon him. He swept aside evidence tending to support the view that the general feeling in and around Decatur was such as to make a fair trial almost impossible. He refused to permit the introduction of vitally important evidence showing that the two young women one of whom has denied that there was any attack) had spent the preceding night in a hobo jungle with two young white men. He flatly asserted from the bench that no Southern white woman, however degraded, would voluntarily have sex relations with a Negro. His attitude toward the chief defense counsel, Samuel Leibowitz, can only be described as one of half-concealed hostility. His mental bias was strikingly revealed when, in charging the jury, he forgot to instruct them how to bring in any verdict except one of guilt. Under the circumstances, it is not surprising that the jury should once again have shut its eyes to the evidence and sentenced the defendant to death. It will be no surprise if similar verdicts are found in the cases of the other Negroes. Appeals will of course be taken ; and it seems reasonable to believe that the miscarriage of justice is again sufficiently obvious to bring the question before the United States Supreme Court. But the real tragedy in the case is still Alabama's.

—

Hitlerism and Labour

The same paper writes :

The fight of the Hitler government against what remains of the German labour movement continues. On December 12 the trade-union organizations, which had a formal existence under Nazi directors even after the police had raided their offices, confiscated their treasuries and sent their Socialist and Communist functionaries into concentration camps, will be officially dissolved. On that day the "vertical union," in which not only all workers, irrespective of trade or industry, but also all employers will become members, will take the place of the trade-union organizations, bringing "peace and friendshlp for all those who work in the Reich instead of the frenzy of the class struggle." It requires no particularly active imagination to picture the "peace and friendship" that the new National Socialist "Labor Front," with its power arbitrarily to fix wages and conditions of work, will bring, now that it is no longer hampered in its subservience to capital by the existence of trade-union organizations. Meanwhile, the Nazi judges are undertaking sadistic orgies of persecution. Six Communist workers were beheaded in Köln last week for their participation in a street fight before the accession of Hitler, in which a Brown Shirt soldier was killed. In the same week ten other Communists were condemned to death for a similar offence. Berlin is witnessing the trial of fifty-three Communists for whom the State Attorney demands capital punishment ; in Dresden eighty-nine members of the Socialist Workers' party were sentenced to 200 years in prison. Up to November, 15,600 Communists and Socialists had been charged with high treason in fifty-six cities under the Göring law, which permits the death penalty for those found guilty. Now the government announces its intention of staging a monster trial of more than 1,000 Socialists and Communist "traitors," arrested since that time, to set an example to other rebellious elements in the Reich. In the language of Göring and Hitler this can mean only one thing : the mass slaughter of men and women who dared to criticize the present regime.

—

Beware of American Drugs

A drastric pure food and drugs Act has been long overdue in America. Now that an Act on this line is going to be passed there, many shocking irregularities in the food and drug preparations are being revealed. Mr. Jonathan Mitchell writes in the same paper :

In the Federal Food and Drug Administration's building in Washington is a little room lined with exhibits of dangerous and fake patent medicines, cosmetics and foods. The bottles, tubes, jars and food packages are neatly mounted on composition board, with legends beneath them describing the various kinds of death, permanent injury and loss of money suffered by their purchasers. The room is not a pleasant place ; in the Food and Drug Administration it is known as the chamber of horrors. However, it gives you some notion of what the drug interests in fact mean when they speak of property rights and free Americans. What they mean is the right of medicine manufacturers to make 500 and 1,000-percent profits from credulous, ignorant and dying people.

The exhibits in the chamber of horrors fall into a number of distinct groups. First and most important are the patent medicines which are either injurious in themselves or else worthless for the deadly diseases they pretend to cure. A typical example—one cited in a recent newsreel talkie made by Mr. Tugwell in defense of the administration's bill—is Banbar. Banbar is made by the L. B. Barlett Company of Pittsburgh, and sells for $ 12 a medium-sized bottle. Its

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

label bears the line: "For the diabetic." It is in fact made from a fairly common weed called horsetail, and its therapeutic value is close to zero.

On the exhibit in the chamber of horrors, beneath a Banbar bottle and a glass jar containing a sprig of horsetail, are two groups of photostats. One group consists of copies of some twenty-five testimonials raceived by the L. B. Barlett Company from sufferers from diabetes. These testimonials were investigated by the federal authorities, and the second group of photostats embodies the results of the investigation. It consists of the death certificates of each of the testimonial writers, recorded within an average of a year from the day the testimonial was written.

Not long ago the federal authorities proceeded against the L. B. Barlett Company in the courts. Dr. Eliot P. Joslin of Harvard Medical School, international authority on diabetes, appeared as a government expert, and testified to Banbar's complete worthlessness. But because of the flagrant loopholes in the existing pure food and drugs law—which has remained substantially unchanged since it was obtained in 1906 by Dr. Harvey W. Wiley after a ferocious fight with the medicine makers—the L. B. Barlett Company was acquitted, and Banbar is still being sold for $ 12 the bottle.

Another exhibit is Marmola, made by the Radalam Company of Detroit. Marmola is a "popular number" in the big drug-store chains. It contains—or has contained—thyroid extract, and is advertised widely as a remedy for excessive weight. According to the legend beneath the Marmola bottle in the chamber of horrors, when taken by normal individuals it may lead to "loss of appetite, nausea, insomnia, palpitation of the heart, sweating, fevers and delirium." A similar case is that of Renton's Hydrocin Tablets, information about which has only recently been compiled by the Food and Drug Administration. Renton's Hydrocin Tablets are made by the Renton Company, Pasadena, California, sell for $ 1.50 a bottle and are advertised for the relief of pain, especially rheumatism and arthritis. The tablets contain cinchopin, the indiscriminate use of which as a drug has been protested by various medical authorities. Taken over a sufficient period of time, cinchopin can bring about atrophy of the liver, and six cases of death from cumulative cinchopin poisoning have lately been reported by the Mayo clinic of Rochester, Minnesota.

The most shameful exhibits in the chamber of horrors, perhaps, are those of poisonous cosmetics. This is the section in which you find photographs of people blinded, and with faces scarred and eaten away. There is a set of photographs of a young Ohio girl, victim of a preparation called Lash Lure, made by a firm in Los Angeles and containing a coal-tar dye. The Food and Drug Administration has a photograph of this girl before her injury; she is unusually lovely. Another photograph is taken in the hospital, her eyes are gone and the flesh around them is a mass of tortured scars. When damage suits were brought by a number of victims against Lash Lure, its discoverable assets were less than a thousand dollars.

The final group of exhibits in the chamber of horrors consists of deceptively packaged and fraudulently advertised foods. The most striking exhibit is Towle's Log Cabin Syrup, two cabin-shaped cans of which are mounted side by side. One can is for sale in those states requiring complete truthfulness in food advertising, and bears the legend, "25 per cent maple syrup and 75 percent cane-sugar syrup." Its brother can for sale over the rest of the country, states simply, "made from cane sugar and maple syrup." Other exhibits display ice cream puffed up to nearly twice its legitimate volume with air, chicken á la King containing just one prominently placed, razor-thin slab of chicken, noodles disguised by transparent coloured paper, fruit jam contaning no fruit.

NOTES

The Earthquake

The history of India, ancient, mediæval or modern, does not record an earthquake which was more destructive and devastating in its effects than or even approximately as catastrophic as that which shook some parts of northern India on the 15th of January last. North Bihar has suffered most, and the independent kingdom of Nepal next to it; other regions have suffered little or not at all. The loss of life and property in Bihar has been appalling. No exact estimate of the number of persons killed or injured has yet been made, nor all the dead bodies yet extracted from under the debris of the houses which are in ruins. Even an approximate estimate of the number of the dead will never perhaps be made. For no record has been kept of the dead bodies thrown into rivers or burned during the first few days after the disaster. The official and non-official estimates differ very greatly. And as yet even guesses have been made as to the casualties only in the towns. The villages have not yet been systematically visited. Perhaps when the final estimate is made as to the number of men, women and children killed in the urban and rural areas, it would not be a matter for surprise if the total came up to a hundred thousand.

As for Nepal, it is said that more than three thousand persons have been killed and three of the biggest towns, including Kathmandu, the capital, are in ruins. In many cases whole families have been wiped out. In more, some survivors remain to mourn the loss of their near and dear ones. In some cases, persons have been dug out alive from under the debris, which shows that if rescue work had been undertaken promptly and systematically, a larger number of lives could have been saved. Pandit Jawaharlal Nehru says it took three days for the terrible news to leak out. The Bihar officials seem to have been dazed and unnerved by the stupendous cataclysm. According to the Pandit, the Government having woken up from their torpor has realized the gravity of the situation three or four days after the event. As regards medical and other relief, his impression was that some officials disliked the idea of any activity that was not completely under them—an attitude which was completely out of place in face of the great disaster. Mr. Nehru also adds that the villages are sadly neglected.

The first thing to do after the calamity was to establish communications. This was not done, with the result that, not to speak of newspapers, even the nearest relatives of persons in the affected areas could not send express telegrams several days after the event. The number of messages held up at Muzaffarpur was 7,000. After the establishment of telegraphic communications, communications by road and rail required to be attended to. Whatever neglect or delay may have taken place at first, it is to be hoped the Bihar Government is now thoroughly alive to its duties.

A regular aerial survey of the whole affected area should be undertaken at once, if it has not been done already.

The careful clearing of the debris under expert supervision and the disposal of dead

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

bodies by burning or burial should be completed as quickly as possible, in order to prevent the outbreak of epidemics. A sufficient supply of wholesome, uncontaminated water is also necessary for the same purpose and for the purpose of relieving distress. For in many places, wells and other sources of water-supply have either dried or choked up.

The sufferings of the people whose houses and all have been destroyed or who have lost the bread-winners of their families, are indescribable—nay, unimaginable. Some kind of temporary shelter, in temporary huts or under canvas, must be immediately provided for the homeless. Clothing and blankets have also to be provided. The need of water-supply has already been referred to. Perhaps the boring of numerous tube-wells is the most practicable plan for this purpose. Wholesome simple food, including milk for babies, has to be supplied to tens of thousands.

All this means the expenditure of a mint of money. Of course the Government of Bihar cannot find all the money required. The Government of India must come to the rescue. The Viceroy has opened a relief fund, which is being liberally subscribed to, the biggest donation announced till now (January 27) being one lakh from the Maharaja of Gondal.

But the people of India have not left the work of relieving distress to the rulers. Before any leader had appealed to them, relief had begun to be given, and relief parties had gone from Bengal with money, food, clothing, blankets, medicine, etc. All the other provinces have also joined in this sacred duty. And all leaders, of greater or less prominence and belonging to different religious communities, have issued their appeals, and some have also begun to make collections. The Calcutta Mayor's Fund has been swelling day by day. It is a silver lining to the cloud that this terrible blow of Nature has revealed the fact of the whole of the Indian people being kin. Funds are being raised in foreign countries also. It may not be possible for a subject, depressed and impoverished people like the Indians to display the buoyancy, the energy, the methodicalness, the spirit of brother-help and the team spirit displayed by the independent Japanese people after the earthquake which laid Tokyo and other places low. But it is to be hoped that the achievement of Indians will not be unworthy of the great ancient country to which they belong. Let everything be done according to a well thought-out and laid-out plan.

In this connection, *The Amrita Bazar Patrika* observes in its issue of the 23rd January last :

> His Majesty the King-Emperor's message of sympathy for the distressed people of Bihar has been much appreciated in this country. The calamity which has befallen Bihar is undoubtedly one of the greatest in record in the whole of the British Empire. This being so, the Indian people expected the Royal donation to be much bigger than £150—the amount Their Majesties have contributed. Their Excellencies the Viceroy and Lady Willingdon have started the Viceroy's Fund with a donation of Rs. 5,000. Sir Samuel Hoare was "much distressed to learn of the serious nature of the earthquake disaster." He has made no personal donation yet. One may say in this connection that in the great earthquake of 1923 in Japan the Emperor of Japan gave out of his private purse 10,000,000 yen and the Japan Government 30,780,000 yen from the State Treasury.

Development of Earthquake Centre in Bihar ?

It has been surmised that probably an earthquake centre has been developing in Bihar. It is to be hoped that the apprehension is unfounded. But, if Bihar does become an earthquake region, there should not be any panic and stampede of people from Bihar. The fatalism of the people of India has been a handicap in many directions. But it should be of advantage to them at least in developing the requisite degree of stoicism to dwell in an earthquake region. Japan is subject to not infrequent earthquake shocks. But the Japanese have not left their hearths and homes. Every now and then, there are tremors and volcanic eruptions from Mount Vesuvius in Italy. But the Italians have not deserted its neighbourhood. The sloping sides of Vesuvius are cultivated almost to the vicinity of the crater.

Whatever regions of the earth we may inhabit, we cannot have a permanent lease with corporeal immortality anywhere.

House Building in Bihar & Nepal

Temporary housing accommodation has to be provided immediately for the sufferers from

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the earthquake. But before the construction of houses of a more permanent character, whether inexpensive or costly, is undertaken, official and non-official engineers and architects should publish plans, with descriptions of building materials, of various kinds of houses for the poor, the middle class and the wealthy which are likely to resist earthquake shocks of at least moderate intensity to some extent. Plans and materials followed and used in Japan and other earthquake regions should be considered and adopted as far as necessary and practicable.

Future of Agriculture in Bihar

In many parts of northern Bihar where there was formerly dry land, there is now water, and some tracts of fertile agricultural land have also been covered with sand. A remedy has to be found and the peasant proprietors or cultivators of these lands have to be helped to get land elswhere, or, if possible, to remove the sand from the surface of the sand-covered areas.

Bihar Sugar Mills and Suger-cane Crop

On account of the earthquake several sugar mills in Bihar have been greatly damaged and their working stopped. This means considerable loss to the shareholders or other proprietors. But as they are comparatively well-to-do people, they may be expected to tide over their difficulties without extraneous help. The case of the agriculturists who supply them with sugar-cane is more pitiable and deserves immediate and careful consideration. They have grown thousand of tons of sugar-cane in expectation of sale. But mills which could have purchased them cannot now do so. Other mills, which are in working order, are situated at a distance and have their own sources of supply of sugar-cane, and cannot buy the surplus cane from the villages in the earthquake areas. Even if they could buy, the roads being damaged, there is no easy means of conveying the cane to these mills. Under the circumstances Babu Rajendra Prasad's suggestion seems to us the best, and practicable, too. He suggests that the village cane-crushing mills, put out of action by the establishment of huge sugar factories, be re-started and others purchased, and all the sugar-cane locally crushed. The juice obtained may be turned into *gur* or raw sugar, and this may be afterwards refined and white sugar obtained from it.

Physical and Moral Causes of Earthquakes

Scientists can communicate to us what they know or can conjecture regarding the physical causes of earthquakes. Religious-minded persons also have their theories. They are inclined to say and some of them do say that earthquakes are a visitation for human sins. Our knowledge of the causation of events is so limited that we cannot dogmatically assert either that there is or that there is not any causal connection between cosmic cataclysms and human transgressions and derelictions. But we find it difficult to accept the theory that earthquakes have any connection with human sins of omission and commission. For, taking into consideration the recent earthquake, it cannot be asserted that the people of north Bihar were more sinful than other people, or that the people of the towns and villages which have suffered most were the most sinful, or that in those towns and villages those who were killed or injured or lost their houses and other property were the most sinful.

The lesson which all of us can and should learn from earthquakes and other similar destructive agencies is that, whether sufferers or not, we are all temporary lessees of the earth and may be turned out without even a moment's notice, and that, therefore, we should make the best use of our term of tenancy and be free from worldly attachments, never putting off till to-morrow what good we can and ought to do to-day, and that, as we are or may be in the same sad plight, we owe one another all possible active fraternal sympathy.

New Right Honourables

Sir Tej Bahadur Sapru and His Highness the Aga Khan have been made Privy Councillors on last New Year's Day. They are henceforth to be styled the Right Honourable so-and-so.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

In the days of the Bengal Partition agitation it was held officially that there was a Right Gh—and a Wrong Gh—. We wonder whether there are any *Wrong* Honourables now !

Except in the case of those who are 'decorated' with titles for literary, scientific and professional eminence—perhaps to make or keep them duly grateful and subservient, which object is not always fully or partially gained, titles are meant as rewards for political services or for abstention from political disservice to the Government. It may, therefore, be inferred that, as both the Aga Khan and Dr. Sapru have been equally rewarded, their services to the British Government in connection with the Round Table Conference, the White Paper and the Joint Parliamentary Select Committee have been considered similar and equal. His Highness the Right Honourable Aga Khan has served his community and indirectly also the British Government by standing up for a communalistic constitution, not a democratic and nationalistic one. The Right Honourable Sir Tej Bahadur Sapru has served the British Government by not standing up irreconcilably for a democratic and nationalistic constitution and perhaps also by not insisting on justice to the Hindu community, to which he belongs. For his professional eminence he was entitled to a privy councillorship long ago.

British Peerage and Indians

It is said that there was a talk of raising Sir Tej Bahadur Sapru and the Aga Khan to the British peerage, but it could not be done on account of the fact that both the Hindu and the Mussalman can be legally polygamous, whereas British peers must be monogamous. Of course, the fact that a British Christian can be and sometimes is illegally polygamous, does not stand in the way of his becoming a lord and sitting in the British House of Lords. There is no question of ethics involved. Illegal polygamy is worse than legal polygamy —particularly so far as the female partners and their children are concerned. It is no loss, but a gain that Hindus and Moslems cannot become British lords.

Home in Brazil for Assyrians

A *Reuter's* telegram, dated London, January 19, 1934, runs as follows :

The Council of the League at Geneva discus the Assyrian question at some length this after Sir John Simon expressed thanks of the Co to Brazil for the offer to settle on agricultural l in Brazilian territorry the whole of Assyrian Iraq, numbering about 10,000 persons.

Sir John Simon said that it was the first ti in history that an entire people emigrated another part of the world and he emphasized successful outcome of the League's efforts to get problem settled.

Special committees have been set up, one in L and one in Brazil, to investigate the methods migration and the most suitable territory. meet the costs of the enquiry 20,000 Swiss fr have been voted.

Sir John Simon is literally correct in statement. For it is difficult to say whether Assyrians, whose religion is not mentioned, leaving their hearths and homes of their o accord or are doing so because they f it impossible to live in Iraq peaceful honourably and safely in the midst of th Moslem compatriots, who are in overwhelming majority.

History does record other mass transf of people. For example, in 1755 some thousands French inhabitants of Nova Sco were deported and dispersed by the victori English. Readers of Longfellow's *Evang* should know the details. Again, as one of t results of the last great war, Grek inhabita in Turkish territory were transferred to Gr territory. The South African Union w fain expel Indians from South Africa.

The history of this emigration of Assyrians, who are among the remnants of of the most ancient civilized peoples of earth, to the antipodes, is to be found bri stated in the last three issues of *News Overseas* published by the League of Nati In August 1933 we read in the papers the massacre of considerable numbers Assyrians in Iraq. In consequence of event, the Council of the League endeavou to find means of resettling in some co country the members of the Assyrian min in Iraq and set up a committee for purpose.

This decision was taken after a discussi the petition from Mar Shimun, the Patriar the Assyrians, which had been brought befor Council by its Minorities Committee (cons of the representatives of Mexico, the Irish State and Norway). The Council also had it the Iraqi Government's observations on petitions.

The report adopted by the Council and up by the representative of Spain says that :

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

"The petitions contain information relating to events which took place last August in the Mosul area, when, it is asserted, some of the Assyrian population suffered treatment which, if these reports should prove correct, the Council could not hesitate to condemn. The Iraqi Government, on the other hand, alleges that the events complained of by the petitioner were consequent upon measures it was obliged to take to put down an armed rising of Assyrian rebels, in which, it suggests, the petitioner himself was not wholly unconcerned, and such an attitude on the part of members of the minority would also, of course, deserve energetic condemnation by the Council. It should also be observed that, until these events took place, the Iraqi Government was carrying on in normal conditions the settlement of the Assyrians."

The Council expressed its regret at having to deal with a case such as this and took note of the assurances given by the representative of Iraq, Yassin Pacha al Hashin, to the effect that his Government were determined to do all in their power to prevent any repetition of such regrettable incidents. It thought no useful purpose would be served by instituting an enquiry, and still less by merely making recommendations to the Iraqi Government. One of the greatest difficulties of the question was that part of the Assyrian population of Iraq would prefer to leave the country if it were given the indispensable facilities and reasonable guarantees that its departure, and especially its resettlement in a country not necessarily adjacent to Iraq, would be effected under completely satisfactory conditions. The Iraqi Government, for its part, had declared itself willing to contribute as generously as its resources permitted to facilitate the settlement outside Iraq of the Assyrians who wished to leave. It had asked the assistance of the League in finding lands for settlement.

When this decision came before the League Council, the representative of Iraq said that the

investigations carried out by his Government had shown that, in the heat of action and in the course of the subsequent pursuit, some elements of the army had acted with excessive severity and certain tribesmen had raided the abandoned villages. There had been innocent victims. The Iraqi Government did not wish to conceal the fact that excesses had been committed, and sincerely deplored them. It thought the only solution, in view of the attitude of the Assyrian minority, was that those elements of the minority who were taking part in or had been influenced by the recent rising should be settled outside Iraq. He deplored the fact that the situation was such as to permit of no other solution.

Sir John Simon, the British Foreign Secretary, said:

It was a profound disappointment that the Council, which had discussed the question of the Assyrian minorities in December 1932, should so soon after have to take it up again in such circumstances. The Iraqi representative had admitted at the Council table that certain parts of the Assyrian population had been treated last August in a way that deserved the severest condemnation. It was true that the documents submitted to the Council showed that a substantial part of the Assyrian population had acted in a reprehensible manner toward the Iraqi Government, but this fact could not be considered to justify the excesses that had been committed. But the Council should look to the future and not to the past. He was in favour of the proposals contained in the Council report.

The French representative, M. Paul-Boncour, was also in favour of the Committee's recommendations and said that conversations were already going on between the Iraqi and the Syrian Governments with a view to settling a certain proportion of the Assyrian refugees. But, unhappily, the power of Syria to absorb immigrants was strictly limited, and the solution could not be reached unless it were possible to settle the Assyrians in countries other than those bordering on Iraq.

In accordance with the Council report, a Committee was set up consisting of M. de Madariaga, Chairman (Spain), and the representatives of Denmark, France, Italy, Mexico and the United Kingdom. Its task is to take, in close co-operation with the Iraqi Government, all such steps as it may think fit to prepare and execute a detailed scheme for settlement outside Iraq of such Assyrians as may express the desire to leave the country. The report stipulates that the Assyrians who remain in Iraq must be regarded as a minority to which the Iraqi declaration would be applicable, guaranteeing full equality before the law, all civic rights and liberties and full cultural and religious freedom. The report also points out that the Assyrians would be bound by the obligations of loyalty to the Iraqi State incumbent upon all citizens of a country.

The Council asked that, in view of the profound anxiety caused by recent events, the Iraqi Government would be good enough to keep its Committee regularly informed, until such time as the expatriation of the Assyrians had been completed, of the measures taken to ensure the safety of the Assyrians in Iraq, to assist the families left destitute in consequence of the events of last August, and to rebuild the villages which had been wholly or partly destroyed at that time.

The Iraqi Government undertook to do all in its power to facilitate the departure of dissatisfied Assyrians and to help the League in carrying out its tasks.

It may be that when the Assyrian emigrants have settled in Brazil, they will lose their individuality, and all trace of this ancient people, who have existed as a distinct entity for so many millenniums, will be lost.

It is a great historical tragedy. But it is better to emigrate in peace than to be exterminated.

The Hindu Mahasabha and the League of Nations

Dr. Radhakumud Mukerji of the Lucknow University has issued the following statement to the Press:

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

"The League of Nation's reply to the Ajmer Hindu Mahasabha resolution has been misunderstood by people. It merely states that the League's resolution on minorities does not confer any powers on the League to enforce it. But the League has unanimously and, with India voting for it, re-affirmed that resolution, which was originally passed in 1922. It was re-affirmed in 1933 in October, the very month when the Mahasabha adopted its resolution at Ajmer.

"The League's resolution expects every member to observe the principle of minority protection, as established in the minorities treaties, in the treatment of its respective minorities. The Mahasabha's simple point is that those principles are grossly violated in the Government's communal award. Even the state of Iraq declared for those principles the other day in gaining admission to the League.

"If the League's principles are found to be too high for India, the more honourable course for her will be to resign her membership of the League as being too heavy a cultural burden for her, and to part company with the society of civilized nations. India today, alone among 55 States-members of the League, is flouting the League's decision on minority protection and the minorities treaties, of which she is herself one of the authors, instead of upholding the authority of the League as one of the original members."

"The Mahasabha proposes to submit a last appeal on the subject to His Majesty's Government and to its many ministers who are League-minded and warm supporters of the League."

The Indian Social Reformer of Bombay observes :

> The Mahasabha need not be sorry. Though the League under its constitution cannot deal with the question at its formal sessions, the members unofficially have been made aware of its views. Some one asked the late Mr. Ranade why he took so much pains over representations and memorials, knowing full well that none of them will have any effect on the powers that be. Ranade replied that he had no illusions in the matter, but that his object in drafting these model documents was to educate his countrymen and to train the public to deal with administrative questions. The Hindu Mahasabha has cast its bread on the waters and may console itself with the hope that it will find it after many days.

"The Communal Decision and the Poona Pact" : An Unauthorized Manifesto

We left Calcutta on the 25th December last and returned on the 15th January. On our return we found on our office table some copies of a printed document with the title, "The Communal Decision and the Poona Pact: A Manifesto." It is not stated therein who has issued it, but it is printed at Sree Saraswaty Press, Ltd., Calcutta. It purports to have been signed by 28 persons, one of whom is the editor of this review. As he never signed any such manifesto, we must treat it as an unauthorized document which need not be discussed.

Alleged Excesses in Midnapore Disfrict

The following resolution was passed at a crowded meeting of the citizens of Calcutta held in Albert Hall on January 17 under the presidency of Mr. A. K. Fuzlul Huq, an ex-Minister :

> "This meeting of the citizens of Calcutta feels staggered at the reports relating to the flogging of persons, destruction of property, forcing villagers to salute the Union Jack, and other excesses alleged to have been committed upon peaceful people in connection with the Route Marches of Troops in the Sub-division of Contai and elsewhere in Midnapore, and enters its emphatic protest against the short-sighted policy of repression which is not only uncalled for but is also inexpedient.
>
> "This meeting further resolves to form a committee of the following persons with a view to explore the means of remedy and the measures of securing redresses to the aggrieved people in the affected areas :—Messrs. Fuzlul Huq, J. N. Basu, B. N. Sasmal, J. C. Gupta, B. K. Basu, Satyanand Bose and P. Banerjee with powers to co-opt."

In the course of his presidential address Mr. Fuzlul Huq said that he consented to preside over this meeting,

> because I feel, and feel very strongly, that a discussion of these affairs vitally affects members of the Hindu community of Midnapore exclusively it is very fitting and proper that one of my community should come forward to associate himself with you in order to make it clear to the Government and the officials that although the oppression or excesses, whatever they might have been, have been directed against a particular community, the other communities also have got the full sympathy with the victims of these excesses of oppression, and that in a moment like this the Mahomedan community is perfectly prepared to stand side by side with you.
>
> "Let it not be supposed that on an occasion like this the Hindu community is absolutely isolated. You are not, my dear friends. If you take upon yourselves a particular course of conduct, if you think a particular measure is necessary to voice your protest, you have behind you not merely the millions of Hindus but also 29 millions of Mahommedans . . .
>
> "Gentlemen, I feel strongly that the course of conduct that the Government has adopted with reference to these happenings at Midnapore is absolutely a move in the wrong direction."

Mr. Pramathanath Banerjee read out certain letters in which police excesses have been alleged. Pandit Jawaharlal Nehru, who

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

was present at the meeting, said in the course of his speech :

Although he was speaking as an individual he believed that he was representing the feelings of other provinces, especially the feelings of his colleagues in the United Provinces, when he said that other provinces of India were keenly feeling the misfortunes that had overtaken Bengal.

Number of Bengal Detenus and Internees

During interpellations in the Bengal Council on Monday the Home Member (Mr. R. N. Reid) said that the total number of internees and detenus was 1,749.

In reply to Mr. Kishori Mohan Chaudhuri, the Home Member gave the following figures of detenus :

Number in Dentention Camps	766
Number in Jails (including Deoli Detention Jail) under section 2 (1) of the Bengal Criminal Law Amendment Act	625
Number interned in villages	255
Number interned at home	104
Total	1,749

Following the suggestion of Rai S. K. Das Bahadur that with a view to effect economy, the number of village internees might be reduced with a corresponding increase in the number of home internees, the Home Member said that the question being one of public interests and public safety was to be decided by the Government and he was not in a position to give a considered answer at this stage.

He also declined to give the amount of allowances the detenus receive.

It is to be noted that all these persons have been deprived of their liberty without trial, on the suspicion of the police.

Pandit Jawaharlal Nehru on Rammohun Roy

During his recent visit to Calcutta Pandit Jawaharlal Nehru was given an address of welcome on behalf of the Students' Rammohun Centenary Exhibition Committee. He made a speech in reply, in the course of which he said among other things :

"I was a school boy in England when we used to read the doings in Bengal. I well remember how I used to be fired up by those acts. Before the national movement grew strong and included all India it was Bengal that really stood for Indian nationalism and Indian freedom."

Addressing the students the Pandit said : "It is you who will form the coming generation. You will function in the public activities. Todays are rapidly merged into yesterdays. Tomorrows are yours. Therefore it is for you to think and make up your mind what that tomorrow is going to be. Bengal has never had to bear a crisis as it has today. But, as a matter of fact, the crisis is not Bengal's monopoly. It has faced all India. It has faced the whole world. Bengal, however, during the last two or three years, had to bear a larger share of the burden. The only other province that might be compared with it in that respect was the North-Western Frontier Province, which had to bear a terrible burden.

Regarding the object of his visit in the exhibition he said, "I have come here partly because it is always a great pleasure to me to meet young men and partly to pay my tribute of respect to him in whose name you are holding the celebration." He was in favour of occupying himself with what he termed aggressive political activities rather than with other activities which, though undoubtedly important, was not the need of the hour. He thought he should not associate himself with what he considered as a side-issue of the moment.

He advocated the use of 'Swadeshi' articles and exhorted everyone to take up its constructive side. But, Panditji added, no reforms, economic, moral or psychological, could take root until the fundamental problem of the freedom of the country is solved.

Pandit Jawaharlal feelingly referred to the "contribution of Raja Rammohun Roy towards India's uplift."

He came at a time when India was in a ferment. It was extremely difficult to get out of the old ruts and it required remarkable wisdom and courage. The Raja possessed that courage and wisdom. "Raja Rammohun Roy," asserted Panditji, "was a rebel. He was no doubt in good terms with the British authorities; and yet, in spite of that, he was fundamentally a rebel. He saw the change coming and did not submit to the conditions simply because they managed to exist. Romain Rolland, the great French savant had said 'thought, if not put into action is abortion.' The Raja translated into action what he thought in his life.

Academic Conference of Bengalis Residing Outside Bengal

A Gorakhpur correspondent of *The Leader* wrote to it :

Gorakhpur, Dec. 29.

The 11th session of the All-India Bengali Literary Conference was held under the presidentship of Mr. A. P. Sen, Bar-at-law, Lucknow.

There were in all eleven sectional sittings with the following as the presiding chairmen over the respective deliberations :—History : Prof. Surendra Nath Bhattacharya (Benares) ; Greater Bengal : Dr. Prasannakumar Acharya (Allahabad) ; Literature : Pandit Rajendranath Vidyabhusan (Benares) ; Philosophy : Prof. C. C. Mitra (Delhi) ; Music : Babu Dwijendranath Sanyal (Lucknow) ; Pedagogy : Prof. Devnarain Mukherjee (Agra) ; Journalism : Babu Ramananda Chatterjee (Calcutta) ; Art : Babu Kusolkumar Mukherjee (Jaipur) ; Science :

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Dr. H. P. Sen (Cawnpore); Economics and Sociology: Prof. Jogeshchandra Mitra (Calcutta).

There was also a special sitting of the women's section, presided over by Shrimati Nistarini Devi Saraswati (Benares).

About 100 delegates from all over India attended the conference. Prominent among the distinguished visitors were :—The Hon. Mr. Justice Sir Lal Gopal Mukherjee, from Allahabad, Shrimati Anurupa Devi and Sjt, Kedarnath Banerjee of noted literary fame from Muzaffarpur and Benares respectively.

The management was in the hands of the reception committee of which Mr. C. C. Das was chairman and Mr. Kshitish Chandra Chatterjee, honorary secretary. There was also a corps of volunteers which included 50 boys and 20 girls, who looked after the comforts of the delegates and the visitors.

All-India Oriental Conference

About 500 members and delegates assembled in Baroda from different parts of India to attend the seventh session of the All-India Oriental Conference held there. It was a complete success. Mr. Kashi Prasad Jayaswal, the distinguished Indologist, presided over the session and delivered an interesting and stimulating address.

His Highness the Gaekwar of Baroda and the Maharani Saheba attended the various sectional meetings on all the days. The scholars and authorities were greatly impressed by the Maharaja's familiarity with several abstruse and difficult topics.

The President conveyed the general view of the scholars that the Baroda session was unique in itself and a landmark in the history of the All-India Oriental Conference. "The arrangements made by the State and honorary workers," said Mr. Jayaswal, "will be long remembered. The invitation of the Hindu University of Benares for holding the next session has been accepted."

Mr. Jayaswal and others expressed satisfaction for the beautiful art-collection of the Hon. Col. Wier. One of the remarkable results attained by the Conference is the general view that the limits of Ancient Indian History must shift back by centuries, and that the time was ripe for undertaking the task by Indian scholars.

His Highness the Gaekwar of Baroda gave a garden party to the visitors.

Dr. P. C. Bagchi, delivered a very interesting lecture on "Cultural relations of India with Central Asia," illustrating various relations with lantern slides.

In short, the conference did most useful work on a constructive basis. His Higness the Gaekwar of Baroda gave an inspiring impetus to the whole session by taking a very keen and sincere interest in all its activities. Baroda has enhanced the importance of original oriental research.

The food exhibition was inaugurated by H. H. the Gaekwar of Baroda, and people were taking keen interest in looking at the various items, and especially the products of "Soya Bean."

Chittagong Magistrate's Drastic Orders

An Englishman's house is said to be his castle. On reading the orders printed below people might think that a Chittagonian's house was his prison.

Chittagong, Jan. 1

The District Magistrate has issued an order directing all Hindu "Bhadralok" males in eight thanas adjoining the Kotwali of Chittagong up to the age of 25 to remain indoors for one week.

Another order prohibits (a) for 48 hours the running of trains on the main line to and from Chittagong with the exception of the Calcutta Mail and Assam Mail. These trains are not to stop at any place within the District to pick up or set down passengers, except at Chittagong, (b) prohibits for 48 hours on Chittagong-Nazirhat line trains except 47 Up and 42 down from stopping at any place between Chittagong and Hathazari, (c) prohibits for 48 hours on Chittagong-Dobazari line trains except 55 Up and 52 Down from stopping anywhere between Pativa and Chittagong. A third order prohibits for 48 hours the Barisal and Coxbazar steamers from taking up or setting down passengers until they passed the outer bar at Chittagong fort entrance.

The fourth order prohibits for 48 hours the plying of passenger launches on Karnafuli river.

The fifth order directs all the courts and offices under the control of the District Magistrate, Chittagong to be closed for 48 hours.

The sixth order prohibits for 48 hours motor traffic on Jularhta-Chittagong-Dacca road and Sholasahar crossing on Chittagong-Mathara road.

The orders were enforced from 10 this morning.—A. P. I.

Chittagong, Jan.

It is understood that the District Magistrate's notice ordering home internment for one month from January 25 has already been served on 3 persons, including 100 students of the Chittagong College.

Armed pickets still continue to guard six crossings—"Associated Press."

In a recent speech of his the Viceroy has declared that all the resources of the Government would be used to crush terrorism. Such declarations, taken with orders like those printed above, might give those who do not know the facts, the exaggerated impression that large areas in India were up in arms against the British raj.

Village homes and small-town homes in Bengal in numerous cases, perhaps in most cases, are not self-contained as regards water-supply, bath-rooms and privies.

People have to resort to rivers and tanks and fields for various essentially necessary purposes. When this is borne in mind,

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

xtreme hardship of being compelled to live ndoors for a week at a stretch will be easily nderstood. There are many homes where he bread-winners and the purchasers of food nd other supplies from the market are young en up to the age of 25. These homes, too, ill be very seriously inconvenienced by the agistrate's orders. It should be noted that most all, if not all, the persons who are being t to trouble are perfectly innocent. Yet the agistrate appears to think that, in order to nt terrorism and to prevent the terrorists om getting new recruits, it is indispensably ecessary to pass orders which cannot but ve the effect of irritating large numbers of nocent persons and inducing in them a mood desperation.

ience Congress at Bombay

According to *The Bombay Sentinel*,

A striking discourse lasting for 90 minutes on the riddle of the universe was delivered by the President, to eminent scientists and scholars of India gathered at the 21st Indian Science Congress which was inaugurated by the Governor of Bombay at the University Convocation Hall on Tuesday afternoon.

Prof. Meghnad Saha, President of the Congress, said that it was impossible to have a complete grasp of the cosmological problems, unless one had some idea of the geography of the universe about us. "Travel with me through space," he said, "with the velocity of light and survey the heavens."

"In a second and a half, the moon is reached which is the nearest neighbour, in eight minutes the sun is passed, which is the source of light and life to us, then in a few hours' time, the last neighbour in the solar system Pluto is left behind and for four years we shall wobble in dust and cosmic radiation."

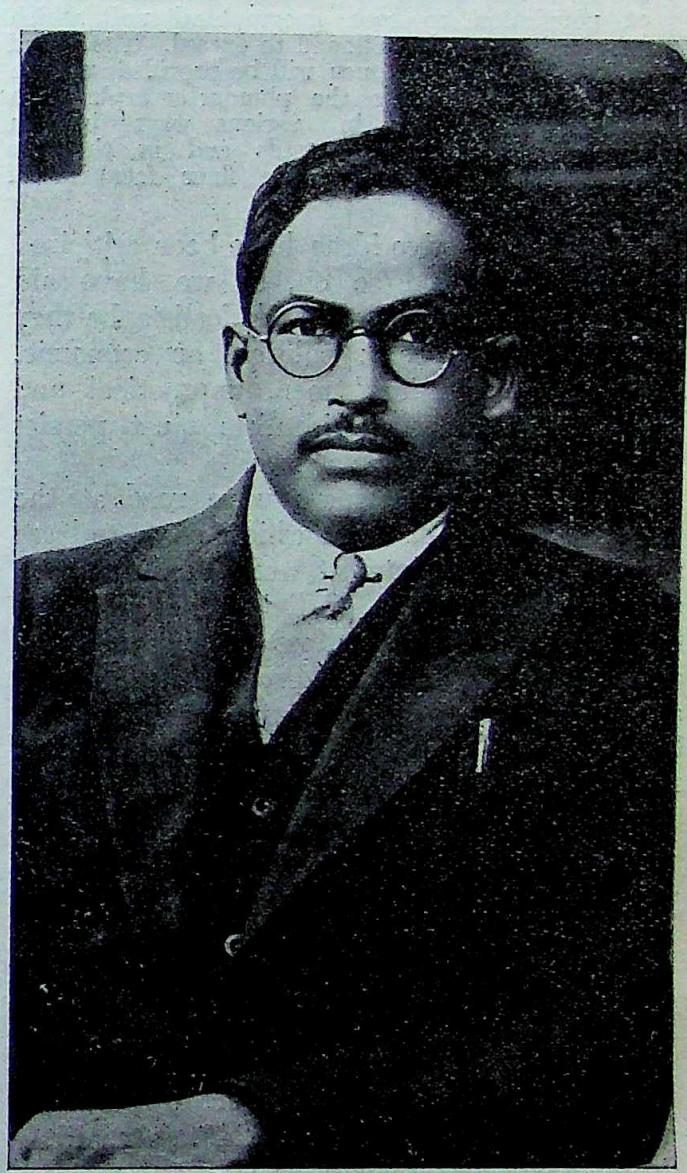
"From thence it takes eight years to make the acquaintance of Sirius, the wonderful companion of the heavens whose bright brilliancy—twenty-nine times the light of the sun—has given rise to innumerable stories and myths in the minds of all nations from the times of the Egyptians. A 135 years' cruise through the rich fields of luminaries and then a time may come when we shall reach the limit of the universe; then nothing but void will remain."

The same paper observes:

The presidental address was an eloquent plea for a closer co-operation between the workers of the scientific services of the Government and professors in universities. He urged that the State must awaken to the need for a proper organization of the scientific brains and pointed out that in other countries the co-operation was so complete that it was not unusual to find universities and services very often exchanging their workers to the mutual advantages of both. Here in India he failed to see that co-operation.

He suggested the formation of an Indian Academy of Science for the proper control and direction of scientific research in this country.

Elsewhere in this issue of *The Modern Review* we print an article on the proposed Indian Academy of Science.



Dr. Meghnath Saha

The following passage in Dr. Saha's address has been criticized in some quarters as being utopian and unpractical:

Owing to improved methods of communication and to much better contact between different parts of the world, the world is fast becoming one economic and cultural unit. But the politicians still persist in their Olympian attitudes.

Economic and scientific studies show that the world has resources enough for her whole population and if there be a rational programme of production and a programme of judicious and equitable distribution, nobody should suffer from

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

hunger and privation and everybody can afford to have much better amenities of life. But for this purpose rivalry amongst nations and communities should give way to co-operative construction and the politicians should hand over many of their functions to an international board of trained scientific industrialists and the distribution should be supervised by economists. The eugenists should devise means for assigning a fixed quota of population to each geographical unit, which it should not be allowed to exceed. The joy of life for the grown-up men will be provided not in designing means for the plunder or exploitation of our fellow men in various ways but in administering to their needs and in the free development and display of the finer faculties of mind.

These suggestive ideas have been criticized as unpractical and so on, as we have said above. But the idealism of all idealists, be they spiritual, moral, social, political or economic, appears to "practical" men, unpractical and utopian. Nevertheless, idealists must persist in disturbing our complacence.

Many interesting papers were read at the Congress. Some of those which seem to have awakened public interest were Prof. Dastur's address on the nature of living matter, Prof. Sisir Kumar Mitra's address on broadcasting as a means of education, Prof. A. C. Banerji's address on the expanding universe, Lt.-Col. S. S. Sokhey's address on the relation of research to teaching in medical schools, etc.

Asoka Pillar at Lumbini

We took advantage of our recent visit to Gorakhpur to see the Asoka pillar at Lummini (Lumbini), now called Rummin Dei, which marks the spot known as the birth-place of the Buddha. It is in the independent kingdom of Nepal. The pillar was set up by the Emperor Asoka about B. C. 249. According to Mr. Gokalchand Nogratha, assistant engineer in charge of archæological works in Nepal Terai, it measures 25 feet from the upper portion of the base to the top. "It tapers slightly with a circumference of about 8 ft. 8 in. round the base, 7 ft. 5 in. near the inscribed portion and about 6 ft. 6 in. at the top. It is slightly leaning to the west at present, though it is not known since when it is so." It has a crack right down from the top straight to just below the inscription, but there is no trace of the same downwards. Mr. Nogratha told us that the crack might have been due to the monolith having been struck by lightning on some unknown date. The inscription remained intact. It records the fact Asoka visited and worshipped the spot after the 20th year of his reign and caused

oj Nalini Dutt Association

The Saroj Nalini Dutt Association for
en's welfare which held its annual meeting

last month, was founded by Mr. G. S. Dutt to perpetuate the memory of his departed wife, the late Srimati Saroj Nalini Dutt. According to an article in *Advance*,

> The Association which started only with 7 or 8 Mahila Samitis can now boast of nearly 450 such Samitis which are rendering valuable work to better the economic condition of our womenfolk. The members of these Samitis number more than 10,000. The Mahila Samitis are purely women's organizations composed or managed entirely by women and they afford ample scope for bringing out and developing their spirit of social service and capacity for organization. The Association has introduced into the hitherto stagnant life of the women of Bengal a magnetic force which is galvanising them into activities for the acquisition of a knowledge of domestic science, hygiene, the science of maternity and child welfare and for receiving training in various cottage industries.

Srimati Hemlata Devi

One of the most brilliant achievements of the Association has been the establishment of an industrial school in 1925. It was started with only 30 girl students on the rolls and now it claims more than 200 women, nearly half of which are widows and married women. The school, which is located at 60B, Mirzapore Street, Calcutta, teaches sewing, cutting, embroidery, chikon work, lace making, carpet weaving, cane work, drawing, literary education and music. The school has also opened a class of general nursing under the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

supervision of Dr. H. N. Ray, M.B. Dai training classes have been started in different districts in Bengal and several hundred professional dais and ladies have been trained and have been carrying on maternity work. Through the benefactions of the late Basanta Kumari Devi, wife of the late Sir Pratul Chatterjee, the Association has established the Basanta Kumari Bidhabasram at Puri where widows above the age of 16 are given an industrial and literary education under the supervision of Srimati Hemlata Tagore.

Srimati Hemlata Tagore is also one of the Secretaries of the Association and editor of its Bengali monthly organ "Bangalakshmi," and is usefully connected with some other philanthropic institutions.

Pandit Jawaharlal Nehru on Work for "Old Ladies"

We find from the papers that Pandit Jawaharlal Nehru has issued the following statement:

> I find from some newspapers that I am supposed to have recommended social and village uplift work to my colleagues and that I myself propose to indulge in this activity. I have no such ambition, nor have my colleagues of the U. P. This kind of safe and pious activity can well be left to the old ladies. My colleagues and I work for the freedom of India and for ending all political and economic domination of Indian masses and we are prepared for the consequences of our action. We do not believe in safety-first.

If Pandit Jawaharlal had simply stated that his colleagues and he were working for the freedom of India and for ending all political and economic domination of the masses and not merely for social and village uplift, that, we think, would have quite sufficed to satisfy public curiosity regarding their plan of work. He need not have slightingly referred to social and village uplift work as "safe and pious activity" fit for "old ladies." To be an unflinching fighter when fighting is necessary is praiseworthy, but uncalled-for combativeness is waste of energy and merely irritates.

For more than a quarter of a century Rabindranath Tagore has been so convinced of the vital necessity of village revivification that his Visvabharati has a rural reconstruction department. Social and village uplift work is included in the Congress constructive programme and has been and is being done by young ladies and old ladies as well as young gentlemen and old gentlemen. The sight of decaying villages all over India led Mahatma Gandhi to declare that "to serve our vil... is to establish *Swaraj*. Everything el... but an idle dream."

There are literally old ladies in Con... ranks who also "do not believe in safety f... They have gone to jail as civil resisters, s... more than once.

It is not true, too, that social and vi... uplift work is safe. We do not refer m... to the fact that village workers in mala... or otherwise unhealthy areas may, and ... unoften do, fall ill and become invalid... also refer to the fact that social and v... uplift work is politically risky. For d... Bengal's long period of tribulations ... young men have been interned who inc... suspicion because of doing such work. ... of them fell seriously ill while under res... or confinement as detenus or internees ... few have even died in consequence. Of c... they were deprived of their liberty oste... as actual or would-be revolutionaries. ... they were never brought to trial, and n... has ever been proved against them.

Social and village uplift work is nec... for winning freedom, though it may be ind... ly, and should not, therefore, be referr... contemptuously. But even if such work ... not of indirect use in the struggle for fre... it ought to be done, because of its own ... sic value and necessity. When India be... politically free, our villages will become ... places to live in from all points of vie... society will also be more equitably ... humanely organized and freed from ... evils. But it is uncertain when the d... freedom will come. In the meantime ... our villages to continue for an indefinite ... period to be the undesirable places th... are? And is society also to continue ind... ly to labour under various curses? If n... social and village uplift work is fit ... undertaken not only by "old ladies" b... others also.

We recognize that political freedo... lead to village uplift but village uplift ... will not lead to political freedom. It ... true that village uplift work and social ... and reconstruction cannot be done satisfa... until and unless India is free. But th... not mean that such work cannot be d... some extent, or is unimportant or unnec...

"Kulabhaskar Ashram" in Allahabad

Munshi Kaliprasad, the founder of the Kayastha Pathshala in Allahabad, was honoured by the Kayastha fraternity by the title of "Kulabhaskar" ("Sun of the caste") being conferred on him. A students' hostel connected with the Kayastha Pathshala has been named "Kulabhaskar Ashram" after him. We had occasion to visit this hostel in October last year. It is meant for very poor self-supporting students. Two of the houses in which they live are mere huts with mud walls, mud floors and roofs covered with country tiles, like the dwellings of the poorest. The boys themselves repair and whitewash the houses when necessary. Their expenses are met from the income of a dairy and a kitchen garden, of which they do all the work themselves without the help of servants. They are inspired with an admirable spirit of self-help.

M. C. C. Matches

The English lady who met all the expenses of the last British expedition to conquer the heights of the Himalayas took the world into her confidence as to her motives in doing so. By the achievement of the British expedition she wanted to show the Indians who were struggling to throw off British domination that the Britisher still possesses indomitable courage, grit and endurance. Who knows whether the M. C. C. have not been touring India to give an exhibition of British superiority in another way?

It were much to be wished that Indians could similarly tour Britain to give a demonstration of their manhood by playing some national game of their own. But even in a game like hockey, which is an exotic, Indians have shown that they can beat all the world.

As for cricket, it was only the enterprise of the Maharajkumar of Vizianagram which has enabled an Indian team to prove once at least at Benares that it can stand up to the visitors, who have carried the day everywhere else.

Nobody will contend that the regeneration of India depends on her sons shining in cricket—*mens sana in corpore sano* is possible without it. But why cannot those in India who are born with a silver or a golden spoon in their mouths, who have enough of nourishing food and plenty of leisure and can afford to keep trainers and who do nothing useful—why cannot they specialize in manly games and show the world that it is easy for Indians to excel in them? Big land-owning idlers all over India can render at least this service to their country.

Mr. J. N. Basu's Presidential Address

In his presidential address at the last session of the National Liberal Federation of India held at Madras, which was commendably brief, businesslike and to the point, Mr. J. N. Basu has shown that what the White Paper scheme offers is neither Dominion Status nor anything approaching it, that it is "overweighted with a tendency to keep back the progressive elements in the State by giving power and prominence to elements that lag behind in experience of work for general welfare and progress in various spheres of life," and that it merely "attempts to tone down some of the aggressive features of an autocratic State." Says he:

> The White Paper cannot be described as a document intended to bring about peace and contentment. It is aggressively reactionary in the matter of communal representation. It goes very much further than either the Minto-Morley scheme or the Montagu scheme in accentuating and elaborating separate communal electorates and seats in the legislatures. It sub-divides the Hindus. There is no recognized principle behind the scheme. What has been given to one community in one province has not been given to another community occupying the same position in another province. Instead of framing a constitution suitable for a modern government facing the future the White Paper seeks to drag us backward to earlier centuries.

Resolutions of the National Liberal Federation of India

The principal resolution or resolutions passed at the last session of the National Liberal Federation of India related to the White Paper scheme. Its criticism of that scheme is comprehensive and cogent. As pointed out by Mr. S. G. Vaze in *The Servant of India*, the Liberal Party's resolution goes much beyond the demand contained in the memoranda of Sir Tej Bahadur Sapru and the British Indian "delegation" to the so-called Round Table Conference.

"For instance, the Liberal resolution lays down that 'no scheme of reforms can meet India's require-

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

ments or satisfy national aspirations or allay political discontent which does not confer the full power and status of a Dominion on India within a short period fixed by statute.' This is a very radical demand which neither Sir Tej Bahadur Sapru nor the British Indian delegation deemed it expedient to make. Perhaps they thought it rather extravagant to prefer such a demand. What the Liberal Party wants is not merely constitutional arrangements which, by their own momentum and in the natural course of development, will tend to bring about Swaraj at an early date, but an express provision in the constitution prescribing the establishment of Swaraj at a specified date, which must be sufficiently in the near future."

Mr. Vaze gives other examples also.

It must have been noted by everyone that the memoranda of Sir Tej Bahadur Sapru and the British Indian delegation have alterations to suggest in the White Paper only in so far as it affects the British Government ; they have none to suggest in so far as it affects the States. The Round Tablers say in effect : We accept the Princes' conditions, but we don't accept the British Government's. The Liberal Party repudiates this position. It sees grave danger in the attitude of the Princes as well as of the British Government. If we get the latter to relax or even eliminate all the safe-guards mentioned in the White Paper, even then the terms on which the Princes are willing to come into the federation will destroy both self-government and poular government. This is the plain meaning of the resolution the Liberal Federation has adopted. See how heavy are the demands it makes on the Princes. It asks that—

(*i*) all the representatives of the States in the Assembly be elected members, indirect election being permitted in their case as a transitory measure for a fixed period ;

(*ii*) that fundamental rights of citizenship be guaranteed to the subjects of Indian States in the federal constitution ;

(*iii*) that the Crown's rights of pramountcy over the States be exercised by the Government of India as at present, and not by the Viceroy, as proposed in the White Paper ;

(*iv*) that, under suitable safe-guards, the federal legislature itself be given the power to amend the constitution, the consent of individual States not being required for such amendment to take effect in any constituent unit of federation.

An Attempt to Meet Criticism of Liberal Party's Position

According to Mr. Vaze, the Liberal Party's resolution might or would be criticized as follows :

The resolution itself leaves very little to be desired. It embodies demands to which the most extreme politicians can subscribe with little scruple. But how are Liberals going to follow it out? What will they be doing to implement it ? What in other words, are the sanctions which they will apply if the improvements which they recommend are not given effect to, as they themselves know and say will not be given effect to ? And what are these resolutions worth, if they have no force at the back of them ?

His answer is :

The Liberal Party has no convincing reply to make to it. But this is not the fault of the Liberal Party, but the misfortune of every single party in the country. For the Liberal Party may address the same question to other parties including the Congress, and none of them will be able to return a satisfactory answer. The fact is that we are all in the depths of political depression and it will serve no useful purpose for one party to be twitting another with inactivity and impotence. The wiser course will be for all of us to put our special gifts in the common pool and thus help, each in its way, to fill the deficiencies of the other and make the country at least a little stronger than it would be with our isolated efforts in different and even opposite ways.

This reply is good so far as it goes. But it cannot conceal from public view the fact that the Congress cannot be charged with "inactivity" in the sense in which the Liberal Party has been inactive. Congress activity has involved much sacrifice and suffering ; Liberal activity, if any, involved none. Congress will not work but will oppose any unsatisfactory constitution framed for India. The Liberals are expected to work any constitution, however unsatisfactory. We do not mean merely that they will enter the councils—some Congressmen may also do so to be in opposition to the Government ; we mean also that the Liberal Party will supply men to hold office as Ministers, etc., in order to derive advantage, if any, including *personal* advantage, from even a very retrograde constitution.

Therefore there is an essential difference between Congress and Liberal principles and practice.

Mr. G. K. Devadhar's Presidential Address

The revival of the annual session of the Indian National Social Conference in December last at Madras is a matter for congratulation—particularly as it could secure so able a person as Mr. G. K. Devadhar, who is both a thinker and a worker, to preside over its deliberations. In the course of his thoughtful address, he observed :

Social Reform so far in this country had naturally to direct its attack against the citadel of orthodoxy and conservatism in which all reactionary and one-sided factors of the so-called national advance remained perched but now, in my opinion, the time has arrived when social

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

reform could be freed from that narrow rut and placed on a wider and more constructive and less critical plane of social reconstruction in which several have been labouring without much moral support from the politicians. But luckily the spirit of the age and the shrinking of distances have caused even involuntary changes of heart and outlook, which would facilitate the work of amelioration of the society as a whole. In the past it was quite necessary to deal with elementary problems of social reform such as sea-voyage, women's education, abolition of caste, stopping of infant marriages, promotion of widow marriages, and of post-puberty marriages, and furthering the age of consent, interdining and even intermarriage, etc.

The bogey of untouchability and unapproachability still haunts us, but its days are numbered, as its foundations are unmistakably shaken by the most powerful influence of Mahatma Gandhi, whose work in this connection, I have always likened to that of a powerful and tremendous blast.

PROBLEMS OF WIDER AND BROADER SOCIAL REFORM

While, therefore, not neglecting work in these above-mentioned directions, we must now begin to concentrate our attention on problems that embrace wider fields and touch the bottom and the top of the society. The justification for such widening of the outlook of Social Reform work lies clearly in the imperative necessity of flowing with the world currents of the rapidly advancing tide of what we call civilization—not necessarily a disease according to Edward Carpenter.

He proceeded to dwell on the failure of science to supply guidance as to the principles, methods and lines of social advance, on social experiments, on women's problems, on the need of bringing politics and social reform in line, on the problem of caste and creed groups, on Japan's anti-caste noble action, on rural reconstruction, etc. Of Japan's noble action he said :

> There was in Japan a class in existence called "Ita and Hinins" whose degraded social position was considered so low in their social polity that even a different set of numerals was used in counting that class corresponding to some such phenomenon in our part of the country in counting units of indigenous sports and games. But Japan woke up more than fifty years ago to this enormity of great scandal perpetrated on human nature and abolished all those barbarous distinctions among human beings by an edict in a moment. Cannot India do any such thing under the new Reforms now by state legislation ?

Social Reform Legislation

The resolutions passed at the last session of the Indian National Social Conference ranged over a large variety of subjects. They included untouchability, the temple-entry Bill, voluntary welfare work, social programmes, study of social science, age of marriage, age of consent outside marriage to be raised to 18 years, unequal marriages, marriage expenses, widows' rights on re-marriage, woman's rights in property, Purdah, domestic science in women's colleges, suppression of immoral traffic, temperance, poverty and unemployment, vocational education, labour legislation, cruelty in the name of religion, divorce Bill, civil marriage Act, enforcement of Children Act, and birth control clinics.

Indian Women's Conference

At the All-India Women's Conference held in Calcutta last December Lady Abdul Qadir dwelt in her presidential address at some length on the unsuitability of the present system of education to the needs of women. She urged that the education that is to be imparted to Indian girls should be such as will fit them for their duties as wives and mothers, besides giving them some general knowledge which would widen their vision. That is true. But it is to be hoped that it will never be lost sight of that women like men are also citizens and members of society who require a liberal education.

The Conference did well to pass a resolution asking that every child should be guaranteed free primary education as a matter of right and that compulsory physical training by qualified instructors be provided for all children from the primary stage onwards. Other resolutions related to labour legislation, factory labour, maternity benefits, minimum age of employment in factories, unemployment, child marriage, indigenous industries, beggar problem, women's franchise, legal rights of women, immoral traffic, untouchability, birth control, capital punishment, rural uplift, and the Indian Women's University.

It is noteworthy that the leaders of the Indian Women's Association have all along clearly demanded a system of joint electorates at their annual conferences and in their representations to the Government and to the Lothian and Joint Select Committees.

It is greatly to be regretted that the Indian Women's Conference did not discuss and pass a resolution on crimes against women, though urged to do so. It is not a communal

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

question. For both Hindu and Muslim girls and women require protection from scoundrels, who, whatever their names may indicate, are miscreants of whom all religious communities have reason to be ashamed. It is some consolation that the Bengal branch of the Indian Women's Association has taken up the question.

The late Prof. Chablani

The death at a comparatively early age of Prof. Chablani of the Delhi University has deprived Sindh of one of her ablest and most brilliant public men. He was a scholarly economist who had rendered signal service as head of the Indian economics department and the first secretary and organizer of the Board of Secondary Education. He was throughout consistently opposed to the separation of Sindh from the Bombay Presidency and had all the facts, figures and arguments against such separation at his finger-tips. He was an able and eloquent advocate of the causes he took up and was always calm and self-possessed, never losing self-control in spite of causes of irritation and excitement. His death at this juncture is a great blow to Sindh—particularly to the Hindus of that region.

Untouchability in India and South Africa

Kunwar Sir Maharaj Singh, practically the Government of India's envoy to South Africa, has told the white ruling people of that Dominion some home truths, however unpleasant they may be to them. According to *Indian Opinion*, published in that country, he recently observed in the course of an address on "Untouchability" delivered to the Wesley Guild in the Wesleyan Church Hall, Boksburg:

> "We Indians form one per cent of the total population of the Transvaal and you speak of us as a 'menace.' How can one person in a hundred be a menace? You say that the Indian is a trader. Of course he is. What else can he be? He cannot be an engine driver, or own land as he can in his own country. There is no country in the world—and I have travelled myself in over 30—where there are so many restrictions against Indians as this great country of yours."

After explaining the untouchability question in India and the great strides made within the last few months in abolishing the evil by the great reform work done by Mahatma Gandhi, the Kunwar went on to say:

> "We are doing something for our untouchables, and the work which is being done in India will never go back. The reforms being carried out can never be negatived in the future. But what about untouchability in this country? In India untouchability has a religious sanction, and you know how difficult it is to remove anything with religious sanction.
>
> "But what have you done in your enlightened and progressive country, for it is truly progressive? I believe I have many sympathizers in this country but they keep their sympathy hidden. I need open sympathizers. You are too timid, you have to take a little more action, a little more courage and you will find that what was bitter is sweet and what was sweet bitter.
>
> "Teach your children not to despise people because they are five shades darker in colour. Everyone of the religious teachers of the world were men with dark skins, Moses, Jesus Christ—I have seen and known the classes from which they were born—Buddha, Confucius, who has many millions of followers in China. What was his colour and what the shape of his eyes? Mahomed and all the great religious teachers were Asiatics, and—forgive me if I say it—were born and lived among the dark-skinned nations, the Asiatics.
>
> "How can you say that progress or culture depends on the colour of a man's hair or how his eyes slant? I do not know if there are any Municipal Councillors here to-night, but I would ask them to spend a few hundred pounds—no one gives more than a hundred pounds or so to the Asiatic—on the improvement of the Asiatic bazaars. We have some very decent fellows living in them. All Indians are not bad lots. And let us do something to help this untouchability in our midst."

Russian Winner of Nobel Prize in Literature

According to the American *Tribune*, although the 700,000 francs which the Nobel literature prize brings him is no small addition to his resources, Ivan Bunin, Russian writer whose works have been translated into almost all Eurapean languages, does not intend to make any changes in his manner of living. He will continue to reside at his Villa Belvedere in Grasse, surrounded by the little coterie of disciples who have joined him in this sunny city on the French Riviera.

In spite of the unexpectedness of the announcement Bunin has said candidly that it was not a surprise, since he knew that he was being considered, but since it was the first time a Russian had ever won the award he considered it a particular honour.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

"I think the prize was awarded to me particularly for my latest book, *The Life of Arseniev*, which has been translated into Swedish," Bunin said.

Ivan Bunin, who was born at Voronezh in 1870, is known in England for translations of his novels "The Gentleman from San Francisco," "The Well of Days," and "The Village," and of his short stories. His work is notable, in the case of "The Gentleman from San Francisco," for its indictment of modern civilization; and in the case of other works for what he himself has called a depiction of "the Russian character without adornment, the Russian soul, its peculiar complexity, its depths, both bright and dark, though almost invariably tragic." Since the Bolshevist Revolution he has lived in exile.

Nobel Prize in Physics

The 1933 Nobel Prize in Physics has been awarded jointly to Professor P. H. M. Dirac, of Cambridge, and Professor Erwin Schrodinger, of Magdalen College, Oxford, for having furthered a new and fruitful development of the atom theory.

The prize for physics for 1932, not hitherto awarded, was given to Professor W. Heisenberg, of Leipzig, for his discovery of allotropic forms of hydrogen. The prize for chemistry for 1933 was reserved.

Nobel Prize in Medicine

Dr. Thomas Hunt Morgan of the California Institute of Technology at Pasadena has been awarded the Nobel Prize in Medicine. He is the first to receive the award in medicine who is not a physician. He is a Professor of Biology and is reputed to know more about what makes the human body tick and how it got that way than any other living researcher. Like all of the really great, Dr. Morgan is modest.

Among notable achievements of Dr. Morgan and his associates recently was the compilation of a chart that sheds new light on the exact locations in the germ cells of the hundreds of microscopic units, or genes, reactions of which determine an individual organism's inherited characteristics. A possibly fantastic dream of science is that this and similar discoveries some day may give man power to control heredity at will by altering certain genes by treating them with X-ray beams.

That scientists are now approaching the point in which humans may be able to lift themselves to a higher plane "by their own bootstraps" is revealed in recent comments and addresses by Dr. Morgan.

Great Japanese Endowment for Scientific Research

In announcing the gift of 30,000,000 yen (£3,000,000 at par) to establish a foundation for public purposes the Mitsui family state that cultural and welfare institutions in town and country are to be supported, but the first place is to be given to scientific research and technical experiment.

The Mitsui family, the wealthiest in Japan, are the owners, after three centuries of trade, of one of the largest business aggregations in the world, including trading, banking, mining, and insurance corporations. The object, according to Seishin Ikeda, the present managing director, is to develop essential industries, such as aeronautics, where private enterprise is insufficient.

A Foreign Tribute to Rammohun Roy

We print below the greater part of a letter on what the followers of Rammohun Roy are doing in India, which recently appeared in *The Manchester Guardian.*

To the Editor of the Manchester Guardian.

Sir,—It is surpising that your correspondents who have lived in India seem to know so little of Rammohun Roy and the Brahmo Samaj (Society of God), which he founded more than a hundred years ago. The centenary of his death has recently been celebrated in all parts of India, and he is universally honoured as the Father of Modern India.

A few years ago I visited twenty-two of the centres (founded by his followers) which exist in all parts of India. In Lahore a conference on social questions would have given points to many such held in England by the enlightened views expressed. In Indore the up-to-date High School for Girls, organized by the Director of Education for the State, was doing remarkable work. In Cocanada orphanages and Rajamundry Homes for Widows (those unfortunate creatures cast out by their orthodox relatives) were doing a truly Christian work; in Pithapuram was a hospital for women, supported by the Rajah and staffed by Canadian medical women; in Bengal the fine work done in the villages by the school and college founded by Rabindranath Tagore. In Darjeeling are Girl Guides and an up-to-date High School; in Calcutta a Home for Destitute women and a most remarkable Social Service League, whose teaching by posters and diagrams might well be imitated by us for the ignorant voters in our large towns. All this work and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

much more is initiated and supported by members of the Brahmo Samaj.

Highly educated and enlightened men and women free from all restraints of caste and creed and working only for the uplift of their fellows should not be ignored by those who desire the best for India and for the British Commonwealth; but, alas! there is so much British racial and caste prejudice.

It is so true what Mr. Nevinson said in his article of the civil servants' "un-selfish consideration of the people's welfare, as they understand it." Alas! they understand so little and ignore the best work that is being done in India by educated Indians themselves.—Yours, &c.,

ANNIE BEARD WOODHOUSE.

25, Broadway, Withington,
Manchester, December 3.

Hindu Mahasabha's Reply to League of Nations' Letter

The following is the full text of the letter sent from the Hindu Mahasabha head office to the League of Nations, Geneva, in reply to their letter of the 1st December, 1933 :

I have the honour to acknowledge your esteemed letter No. 1-2216-2216, dated the 1st December, '33, (together with annexed documents) and am directed to reply as follows :

The Hindu Mahasabha acknowledges the courtesy of your letter and the consideration you have bestowed on its communication to you. It is fully acquainted with the fact that the League is not empowered to enforce the Minorities Treaties and Stipulations except against those States who have signed them.

But the point of the Mahasabha is that though India is one of the originators and authors of the Minorities Treaties, the British Government of India is itself violating the principles of those Treaties in the treatment of Indian Minorities in a manner which is subversive of the State itself and of its solidarity. The British Government's scheme for the protection of Minorities in India seeks to protect them by means of Separate Electorate and Representation, and in some cases even by giving them, at the expense of the majority community, a weightage of representation out of proportion to the natural weight in number or influence of the Minority concerned. There is even a proposal to protect a favoured Majority by establishing for it a statutory majority in the Legislature. You will agree that if this system of Minority Protection finds its way into Europe, it may lead to a serious conflict between its more militant communities with all its evil consequences and ultimately to a general war which the Minorities Treaties were framed to prev... It is because the system is a menace to Pe... that the Hindu Mahasabha invoked Art... XI of the League Covenant in its le... under reference.

Again, although India was a party to ... and had voted for it, the British Governm... in India is flouting the special Resolut... meant for the non-signatory members of t... League which, as you point out, was f... passed in the Assembly of 1922 and ... affirmed in that of 1933. This is show... scant courtesy to the League and its w... and the ideals it stands for, on the part of ... great State which is an original member ... one of the founders of the League itself, ... as such is expected to be the custodian ... its authority and prestige. No member ... the League can deny the moral obligati... which the Resolution in question was adop... and repeated to establish and empha... Mr. Arthur Henderson, presiding at ... League Council meeting of January, ... went so far as to declare that "This sys... of the protection of Minorities was no... part of the public law of Europe and of ... WORLD."

The object of the reference of this m... to you by the Hindu Mahasabha was ... seek your good offices in suggesting ... securing ways and means by which it may ... brought up for discussion by the Le... Council. Such a discussion, the Mahas... trusts, will not be discouraged by ... British statesmen who represent the Governm... of the United Kingdom on the League ... are sufficiently League-minded to lead on ... expect that they will recommend the adher... to the aforesaid Resolution by the Gov... ment of India, which is subordinate to ... Government.

I am to add that the Mahasabha wi... glad to send a delegation to confer with ... informally and quite un-officially on ... whole subject sometime in summer.

I am directed to submit to you a ... brochures issued on the subject by Pro... Radhakumud Mukerji, M.A., PH.D., Prof... of History at the University of Luck... and one of our Vice-Presidents, and ... literature of the Hindu Mahasabha on ... subject, which is being forwarded by ... ordinary mail.

Bill for Fighting Terrorism in Bengal

Before these lines meet the eyes of the reader a Bill will have been officially introduced in the Bengal Council the statement of whose objects and reasons says: "The Bill seeks to supplement the existing criminal law so as to enable the local Government to grapple more effectively with the terrorist movement." This is what has appeared in the daily papers. The Bill with the statement of its objects and reasons, as officially published, is not before us. But even if it were, it would be futile to criticize it in great detail, if the object of such criticism were to influence the Government. It appears from what has been published in the papers that

> Clause 3 of the Bill proposes to inflict death sentences for manufacture, possession or sale of arms ammunition or military stores but this will be confined to offences committed in circumstances indicating that the offenders intended to use the arms for the commission of murder or abetment or knew it likely that the arms would be so used. The necessity for this provision will be found in the fact that several cases of use of country-made arms by terrorists have recently come to the notice of Government.

On whom will lie the burden of proof of intention and likelihood?

There is a widespread movement in the civilized world for the abolition of capital punishment even in cases where murder has been actually committed. But in Bengal death penalty is going to be provided even when murder has not been committed or attempted, on the ground of "intention to murder," which is difficult to prove, or of knowledge of likelihood of murderous use!

It is stated that the necessity for this provision will be found in the fact that *several* cases of use of *country-made* arms by terrorists have recently come to the notice of Government. Were such arms used for committing murder? Was murder actually committed? Is the illicit use or possession of *country-made* arms a more heinous offence than the illicit use or possession of foreign-made arms? It may be argued that if the illicit manufacture of arms in India and their subsequent unlawful use be not stopped by drastic punishment, such malpractice will increase. But country-made arms are not more destructive than arms made abroad. So, it is not clear why the use of foreign arms by terrorists in *many* cases did not necessitate the provision of the death penalty, whereas the use of country-made arms in *several* cases proves the necessity for the provision of such penalty. The illicit manufacture and use of country-made arms and the illicit smuggling and use of foreign arms should have been treated alike.

> The Bill seeks to make the existing temporary Criminal Law Amendment Acts of 1925 and 1930 permanent, as in the opinion of the Government "Terrorist Conspiracy has unfortunately gone past the stage when it can be regarded as an ephemeral movement, and temporary legislation keeps alive the hope in the minds of those concerned in the revolutionary conspiracy that Government will before long be deprived of the power to continue against them the special measures which they from time to time put in force."

Severe punishment is provided in the *permanent* penal laws of all civilized countries for heinous offences like murder, robbery, etc. Yet the mere fact that the laws are permanent does not prevent or diminish these crimes, or increase the efficacy of those laws. Murders, etc., continue to be committed in full knowledge of permanent penal laws. Moreover, before making these laws permanent, Government ought to consider, whether they have been efficacious in suppressing terrorism, or have rather caused irritation, thus indirectly facilitating the recruiting work of terrorists.

Governors-General and Governors have occasionally said that the root causes of terrorism must be removed, if the movement is to be crushed. But in practice little has been done in that remedial and constructive direction, so that Government appears to depend for success entirely on enacting more and more drastic laws and on prolonging or perpetuating the life of such laws.

> Dealing with the Press the statement says that since the passing of the Press Act of 1931, direct encouragement of murder or violence has perforce been abandoned, but recourse is still freely had to indirect methods, such as the expression of undue concern and sympathy for detenus in the Detention Camps and convicts in the Andaman Islands, commemoration of terrorist convicts and detenus and the publication of laudatory accounts of revolutionary movements in other countries—all of which are bound to have the effect of putting revolutionary ideas into the susceptible minds of the young.
>
> The Bill proposes to amend the Indian Press Act relating to Bengal empowering Government to demand security or forfeit security or forfeit the Press for publication of prohibited information. The Press is also made liable for publication of

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

identity of witnesses before special courts when this is forbidden.

Though the detenus were never brought to trial and their guilt established, journalists are required to take it for granted that they are criminals. Even if there is reason to apprehend that they and convicted criminals are not receiving such treatment as they are legally entitled to, no concern or sympathy is to be expressed for them. The Executive Government, that is, practically the police, are to be the judges of what is due and what undue concern. It is idle to expect that the prevention of the printed expression of concern and sympathy will kill such concern and sympathy when they are natural.

The police and the executive are also to be judges of the character of the changes of government described in history, past or contemporary, and the damnatory name of revolution given to any such movement must be considered sufficient for preventing the publication of an account of it *in Bengal newspapers*, not in other Indian newspapers. All revolutions are to be held to have been bad. The super-historians or critics of history in police offices are also to be judges of what is or is not a laudatory account of such events. Bengal newspapers are not also to publish prohibited information—what is to be prohibited being apparently left to the discretion of the Government. Fine newspapers they would be which could not publish news of all kinds which are usually published. The fetters on the Press are going to be tightened, made heavier and more galling.

> There is also a clause in the Bill which makes a person liable to imprisonment for three years and fine, if he has in his possession any newspaper, book or other document which had been prohibited under Sea Customs Act, declared forfeited to the Government, etc.

This is not the first time that legislation of this description is being attempted. On previous occasions, such attempts were baffled or given up. But the present Bengal Council is such that no such result can be expected.

Few there are, if any, who can remember the names or contents of all proscribed, prohibited and forfeited books, pamphlets, leaflets, etc. Hence, on the passage of the clause described above, it should be incumbent on the Government of Bengal to publish a consolidated list of such publications for free distribution and issue supplementary lists from time to time. The Postal Department of the Government should also be bound not to deliver to anybody such publications sent by post. In newspaper offices many packets remain unopened for a long time or, if opened, unread for days, weeks and months. It would be unreasonable and unjust to punish persons to whom the Government's post office has delivered such packets unasked and who are unaware of their contents.

Magistrates are proposed to be given many powers of the Provincial Government. The superiority of governance by definite and uniform law to governance according to the will of one or more individuals lies in this that the former ensures equality of treatment to a greater extent than the latter. But even where a Government has some discretionary power there is some equality of treatment for the time being. When, however, discretion is given to District Magistrates, they being not one but many, there is likely to be little of the reign of law, of which civilized rulers are or should be proud.

But enough.

Salt Industry for Bengal

At a public meeting held at the Albert Hall, Calcutta, under the presidentship of Mr. Nalini Ranjan Sarker, the following resolution moved by Mr. B. N. Sasmal, urging the Government to continue its policy of protection in the interests of the nascent salt industry, was unanimously adopted.

"That this meeting of the citizens of Calcutta and the people of Bengal resolves that in the interests of the national salt industry the present policy of protection be continued for a sufficiently long period to enable the indigenous salt industry to grow and prosper and that it also urges upon the Government to give all facilities and assistance pecuniary (out of the provincial additional import duty fund) and otherwise for the growth and development of all Bengal salt concerns."

Moving the resolution, Mr. Sasmal said that much had been said about import of salt into Bengal before the advent of the Britishers in India, but that was a myth. Salt was

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

factured in Bengal and other provinces and it could now be manufactured. He urged that money be paid out of the additional duty to Bengal concerns for experimental purposes, and if then they failed to produce salt commercially, they would then have the consolation of having tried their best without effect.

Mr. Sarker said that, "so long as we, Bengal Salt Industry, are not self-supporting, let the protection continue ; but we should realize that the prosperity of the industries of other provinces would not solve the burning question of Bengal's unemployment. Nobody could render better help in this direction than the joint efforts of the people in organizing the thousand and one small industries which would throw open their doors for the unemployed. He also warned the authorities concerned not to send somebody of Karachi or elsewhere to Bengal when the question of local distribution of agency came in.

Bhai Parmanand and the White Paper

As president of the recent All-Bengal Hindu Political Conference, Bhai Parmanand tried to explain why at the Ajmer session the Hindu Mahasabha did not condemn the White Paper as a whole but only the Communal "Award" which forms a part of it. Said he :

> "We are opposed to the White Paper just as much as anybody else, but our reason for specially protesting against the Communal "Award" is that while the safeguards and powers that are reserved to be used by the Viceroy and the Provincial Governors in the White Paper could only be used in times of emergency and were in a way to serve as the last line of defence by the Government, we have got in the very nature of the Communal "Award" the first line of defence which could be of service to the Government in normal times."

We do not think this explanation will bear scrutiny. For even *for normal times* and as part of the first line of defence of the British imperialistic citadel, the White Paper provides complete reservation of Defence and Foreign Relations, financial and commercial safe-guards, the supremacy of the British Parliament and the impossibility of amending the constitution without its sanction obtained every time, safe-guards for the Services, etc.

Bengal Hindus and the Poona Pact

The following resolution was passed at the All-Bengal Hindu Political Conference :

> "This Conference of all sections of the Hindu community of Bengal is of opinion that if the Communal Award is thrust upon the Hindus of Bengal, then in the interest of the political progress of this Province, the Poona Pact, so far as it relates to Bengal, should be revised so as to provide a system of joint electorates with reservation of seats proportionate to the population strength of the sub-castes which might ultimately be scheduled as 'Depressed.' This Conference appoints the following committee (with power to co-opt) to bring about such revision of the Poona Pact (preferably by amicable settlement among the different sections of the Hindu community of Bengal) in consultation with the Bengal signatories of the Poona Pact."

This resolution is quite reasonable and worthy of support.

The committee includes members of both those castes which are considered high and those which have been officially scheduled as "depressed" provisionally.

Crimes Against Women

Babu Krishna Kumar Mitra, than whom no prominent public man in Bengal has laboured more earnestly and unremittingly to safe-guard the honour of womanhood, presided over the recent All-Bengal Women Protection Conference. In the course of his presidential address he said that during the six years from 1926 to 1931 there had been 7,000 cases of abduction and other crimes against women in Bengal. Of the women victimized 3,513 were Muslim and 3,495 Hindu. "People say," he observed, "that it is only Mussalmans who commit crimes against women ; but that is not correct. About a thousand Hindu women were victimized by Hindus alone."

The conference passed several resolutions, one demanding the sterilization (by vasectomy or castration ?) of the men proved guilty and the condign punishment of men and women who aided and abetted such crimes, another requesting the Government to amend the penal laws "to exonerate from criminal liability women who may chance even to kill their assailants to save their honour," and a third thanking the Governor of Bengal for the active interest he has been taking for the suppression of crimes against women.

Extravagant Educational Expenditure !

The Viceroy's reply to the address presented to him by the Benares district board contains the following amazing passage :

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

"While I give way to none in my desire to promote the growth of learning, I have noticed that the cause of education sometimes flourishes at the expense of other equally deserving objects."

If His Excellency had been bound to answer questions, we would have asked him where in India generally and in the United Provinces in particular had he noticed education *flourishing* and that at the expense of other equally deserving objects. We are afraid his desire to promote the growth of learning has been largely an unfulfilled desire, and, therefore, he may have to give way to numerous persons in that desire against his will. Further comment is unnecessary.

Prospects of Peace in Eastern Asia

A *Reuter's* telegram, dated Moscow, January 28, runs as follows:

The phantom of war revenge overshadowed capitalist countries, declared M. Stalin, who in a report submitted to the Communist Party Congress predicted another world war.

The Sino-Japanese war in Manchuria and Japan's advance in North China had aggravated the position, while the growth of military and naval armaments in Japan, United States, Britain and France was a result of the struggle for possession of the Pacific Ocean.

M. Stalin denied that the Soviet was responsible for the breakdown of negotiations for the sale of Chinese Eastern Railway and stressed that the Soviet would strive to obtain improved relations with Japan.—*Reuter.*

Just a month ago, on December 28, 1933, M. Litvinoff delivered a speech at a meeting of the Soviet Executive Committee held at Moscow. In that speech he stigmatized Japan's policy as the "darkest and most threatening cloud on the international political horizon." He referred to "the impudent and provocative activities" of the Japanese authorities in Manchukuo, and added:

We had no recourse except to strengthen our frontier, transferring there necessary forces and taking other military measures. But while we take exclusively defensive measures Japan feverishly prepares for a war which can only be offensive, because no one threatens the safety of Japan.

When he concluded his speech with the following militant note, he received a great ovation:

We will strengthen still more our Red army, fleet and air force. In the defence of every inch of Soviet land will participate not only the military forces but the peoples of the Soviet Union, who under the leadership of the communist party and its leader Stalin, will certainly win military victories equal to their peace-time victories.

There may be a blaze in the Far East any moment.

Independence Day Arrests

Independence Day, January 26, does not seem to have been widely celebrated this year. Arrests are reported in papers in provinces other than Bengal in a small number of places, *viz.*, New Delhi, Allahabad District, Bombay, Lucknow, Poona, Lahore, Cawnpore etc.

150th Anniversary of the Asiatic Society of Bengal

The hundred and fiftieth anniversary of the Asiatic Society of Bengal was an event of outstanding importance. A remarkable feature of the occasion was the collection of spontaneous unsolicited congratulatory messages from 36 learned institutions from 15 different countries. The Society has a considerable amount of antiquarian and scientific research in various fields to its credit.

The conversazione held in this connection in the Indian Museum on the 15th January last gave an opportunity to the public to get acquainted with the harvest of research and exegesis reaped in India by numerous scholars in different branches of knowledge. Exhibits were sent by departments of the State, the University and individuals.

Mr. A. F. M. Abdul Ali, Imperial record-keeper, has lent a number of documents which students anxious to follow the thread of the British period of the Indian history may with advantage utilize, *e. g.*, under the head 'The Dewanny and Administration' there are on view amongst other documents three copies of *Firman* for the *Dewanny* of the provinces of Bengal, Bihar and Orissa (dated September, 1765).

The Botanical Survey of India have sent some of the original paintings of William Roxburgh, who was a surgeon in the Company's Medical establishment and was the first superintendent of the Royal Botanical Garden (from 1793-1813).

Prof. S. K. Chatterji has sent a number of relics of Indian civilization collected by him from Siam and Java; while the departments of Chemistry and Physics of the Science College, Calcutta University, have also lent a number of scientific exhibits.

One of the most important and interesting groups of exhibits is those lent by Mr. K. N. Dikshit, superintendent of Archæological Survey, eastern circle. They consist of finds from Mysore Palæolithic and Neolithic sites in Mysore, Hyderabad and Madras presidency. There are also exhibition pottery from the graves at Jutthanahalli, Bangalore. They belong to the Early Iron-

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

and the most remarkable feature in one of them is the incised lines round the neck produced by thread and the four small jugs like those of late Bronze Age pottery of Central Europe. Another interesting point is that most of these bear potter's marks. Antiquities from Satyapeerer Bhita, Paharpur, Bengal, where the biggest Vihara in India has been excavated, will interest many.

To the students of the social history of the mediæval period the copper-plates on view at the exhibition will appear to be of exceptional importance as it proves the hollowness of the tradition that there were no Brahmins in Bengal before Adisura who is credited to have imported into Bengal five Brahmins and Kayasthas from Kanoj. There are a copper-plate in Brahmi inscription from Mahasthan, Bogra, and antiquities from Mathura also on view.

The Geological Survey of India have sent a number of Palaeontological specimens, including an exhibit of giant pre-historic Rhineceros of India and Beluchistan. The exhibits consist of the casts of the skull and jaw of Beluchitherium, which lived in Oligocene-Miocene times and outrivalled the elephant in size, being one of the largest known land mammals that inhabited the earth. Among others the fossilized remains of giant reptiles called Dinosaurs that lived in India during the Cretaceous period about 70 million years ago, are also on view.

Many beautifully coloured Arabic and Persian manuscripts from the Asiatic Society's library are also exhibited.

Dr. Satya Churn Law has sent some birds of Habitat group and some colour drawings of some Indian birds.

The School of Tropical Medicine and Hygiene has sent among other exhibits samples of indigenous drugs.

The Anthropological section of the Zoological Survey of India, have sent the personal attire and ceremonial objects of the Kaffir tribes of the Hindu Kush mountains, which are very interesting. These objects were procured from the Kaffir tribes by Dr. B. S. Guha of the department, in 1929, in connection with the scientific expedition sent there by the Government of India to work in collaboration with Prof. G. Morgensteierne of the Norwegian Institute of the Comparative Research in Human Culture.

There is exhibited the Termite Queen, which is pointed out by the experts to be a characteristic species possessing an enormous size of abdomen. It hardly moves and all its needs are attended to by other members, which are known as soldiers and workers. Its function in the colony is to produce young ones and even its nursing is done by the workers. There are on view Cicadil Bugs, which are well known for having voiceless wives. Only the male insect of this group can 'speak.'

The means of defence adopted by insects against the attacks of their enemies is exhibited in another section. Of these, mimicry and having warning coloration are profoundly interesting. Many palatable insects, it is pointed out, avoid the attacks of enemies by resembling other and biologically distinct kinds which are distasteful on account of their possessing a sting or bad taste or smell. Many distasteful insects warn their enemies of their being such by having very conspicuous colour or type or colour markings. Several insects showing the phenomena of mimicry and warning coloration are also exhibited.

So-called All Parties Conference

In a circular letter signed by Sir C. H. Setalvad, Chairman of the Executive Committee of the (so-called) All Parties Conference it is stated that "at this conference, the Communal Award and the questions arising therefrom will be excluded from consideration. Similarly, what action should be taken, if the minimum political demands on which there is general agreement are not conceded, will also be outside the purview of this conference." It is said that "the Executive Committee decided after great deliberation to exclude these questions from the agenda. . ." That may be. But it is obvious that, if the White Paper scheme as a whole or any part of it is considered sacrosanct, there cannot be a real *All* Parties Conference. There are very many Nationalists in India who are convinced that the White Paper can be usefully improved only by being rejected lock, stock and barrel. Apart from the fact that the Communal Decision is a fundamental part of the scheme, it does great injustice to the Hindu majority, reducing it to the position of an impotent minority. Therefore, the Hindu Mahasabha and those who see eye to eye with it in this matter cannot take part in a conference which takes it for granted that this iniquitous decision cannot be scrapped or changed. There may be and are those who think that the Mahasabha is a small and weak party. Assuming the truth of that view, it must be conceded that the Mahasabha *is* a party, and, therefore, a conference in which it cannot take part cannot be an *All* Parties Conference either in name or in reality. Again, the Communal Decision goes against all ideas and ideals of nationalism and democracy. Hence, no one who is a nationalist or democrat of any sort can have anything to do with a conference which treats the Decision as sacrosanct.

The Conference can only do some tinkering. But no amount of tinkering can convert the White Paper scheme into one for giving India even the constitution of a British Dominion, not to speak of one which would make her free like the free and independent countries of the world. Hence, genuine seekers of Dominion status or of independence can have no use for the proposed conference.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Nevertheless, it may serve the purpose of ascertaining and telling the world what changes in the White Paper scheme are desired by those very accommodating politicians of India who can put up with the Communal Decision and a constitution which transfers no real power to Indians in their and their ancestors' motherland. But this is a small purpose. And the gaining of this object loses further in importance when it appears almost certain from the circular letter that, even if the British Government did not concede the minimum demands of the conference, there would be many among the promoters and adherents of the Conference who would work and accept office under the new constitution, whatever it might be.

The Indian States' People and the White Paper

As president of the Rajputana States' People's Conference Mr. Amritlal Sheth has appealed by telegram to Mr. George Lansbury, leader of the opposition in the British parliament, and Sir Herbert Samuel, the Liberal leader, to try to defeat the White Paper Bill, on the ground that "the White Paper refuses elective representation and fundamental rights to the States' people and increases the power and influence of the already autocratic Princes." The appeal is quite just. Throughout the constitutional inquiry, ending with the proceedings of the Joint Parliamentary Committee, the people of the Indian States have been treated by the British Government as non-existent and the Princes as all in all, though these people number twice as many as the inhabitants of the British isles.

The Princes' Protection Bill

The States Protection Bill now before the Legislative Assembly is really a Bill for conserving and increasing the autocracy of the Princes. In the Indian States there are not and cannot be any newspapers which enjoy even the little freedom which Indian newspapers in British India can exercise. So within their States the Princes cannot be effectively criticized. The Bill seeks to protect the Princes from effective criticism on the part of newspapers in British India too. Perhaps this attempt to safe-guard and increase the autocracy of the Princes is offered as a further inducement to them to join the so-called Federation. And they are wanted in the Federation to check and counteract the forces of nationalism in British India.

The special session of the Indian States' People's Conference which is proposed to be held early this month in Delhi to protest against the retrograde Bill will be most timely. It ought to be very largely attended by influential representatives of all the States and also by leading citizens of British India.

Mahatma Gandhi and some Provincial Governments

Mahatma Gandhi has been touring India for the uplift of the depressed classes. Government professes great concern for the welfare of these classes. But as the Mahatma is the greatest political leader of India and not in the good books of the Government, there must not be any co-operation between him and Government servants even in a movement meant for the social and educational advancement of these classes. That is the plain meaning of the Madras Government's circular to public servants for their guidance in connection with the Mahatma's tour, telling them in effect not to participate in meetings and demonstrations connected with his visit. It is some consolation, however, that they appear to have been told that "they need not put obstacles in the way of Mahatma Gandhi's tour, or do anything which would be construed as an interference."

In the Central Provinces also "public servants," which means Government servants not necessarily servants of the public, have been enjoined to non-co-operate with the Mahatma in his humanitarian work.

Social Legislation in Baroda

Recent legislation in Baroda intended to secure to Hindu women their just rights in property and the right under some circumstances of asking for a divorce, conferred by the Hindu Divorce Act, which has been in force in that State since 1931, will place women there in a far more advantageous position than in British India.

LALA LAJPAT RAI

III. Discussions Regarding Indian Reconstruction

BY ST. NIHAL SINGH

I

LALA Lajpat Rai returned from the United States of America, at the beginning of 1920, a far different man from the one who had gone there some five years earlier. The change loudly proclaimed itself the moment I set eyes upon him and heard him speak.

He looked different. Ten, probably fifteen years, seemed to have been taken off his face and figure. There was spring in his step, vigour in his movements and vitality in his voice and gesture.

The tired, pale look that I had noticed on the eve of his departure in 1915 had disappeared. What was even more remarkable, the feeling of depression that sometimes swept over him had left him. He was cheery—not in a forced sort of way, but genuinely.

"The United States has certainly agreed with you, Lalaji," was my greeting when we met for the first time after years of separation.

"It did indeed," he replied. "The climate was invigorating. The food was good. The people were cordial. I thoroughly enjoyed myself."

II

Not only were his looks different, but so also was his speech. He had picked up the Yankee twang that one associates particularly with people from the Eastern States comprised in the American Union. He seemed to talk through his nose rather than through his mouth.

His speech had changed in other respects. He had fallen victim—a willing victim, it seemed to me—to Americanisms.

Phrases such as "I guess so" or "I guess not," frequently fell from his lips. He spoke of a "block" of paper instead of a "pad," as the English would put it. He had learnt to call the chemist a druggist, and the chemist's shop a drug-store.

I particularly remember his asking a maid at 29, Rollscourt Avenue, Herne Hill, in south-eastern London, where we then lived, to bring a vase. He pronounced the word in the American way—to rhyme with "lace," and not "vaaz," as the English articulate it. The poor servant—an English woman who had come down in life—was puzzled. But only for a moment. She saw that he was carrying a bouquet of flowers in his hand and being intelligent, brought the best looking vase we had in the house, which she had, of her own accord, filled with water. She took the flowers from Lalaji's hand and neatly arranged them in it.

The English do make marvellously good servants!

In using American slang Lalaji, I soon found, occasionally "slipped up." I remember, for instance, hearing him say: "You are *a*

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

limit." An American would have said: "You are *the* limit."

I told Lalaji that his Americanisms carried me back to my early days in America. I, too, had found the American atmosphere exhilarating—intoxicating. When I called upon Lord Morley at the India Office early in 1910 he, perhaps taken aback at my manner and matter of speech, remarked:

"You speak, Mr. Singh, what our cousins in America call English." Lajpat Rai heartily enjoyed the joke directed against myself.

III

Nor were the changes merely of a superficial character. The secularist tendencies of which I wrote in the preceding article had, for instance, become very much more pronounced. He was quite definite in his opinion that religion, as it was professed by our people, was the root cause of the trouble in our Motherland.

The Arya Samaj phase had ended. Between his life in India prior to 1915 and his return there in 1920, his stay in the States constituted the "great divide."

Difficulties did not seem to daunt him. Obstacles stood in the path of political progress, he recognized. Many of them were formidable, he admitted. But he felt certain that they could be moved out of the way—could be blasted away if necessary.

The five years that he had spent in the New World in association with people filled with optimism had given him a feeling of confidence of the kind that works miracles. In all the talks that I had with him—and there were many of them, even though his stay in England was brief—that note was unmistakable.

IV

He would come down to Herne Hill late in the afternoon by when I would be free—or would make myself free—from my journalistic work. We would sit in the study in the back of the house, opening directly on to a piece of ground enclosed by a high brick wall, in front of which stood a row of tall, slender, graceful poplar trees. The house to which we had shifted from East Dulwich during his absence was somewhat larger and more easy of access. But it did not command the lovely, long, widespreading vista that had opened out from my study windows in our former residence.

He generally came about tea-time and stayed to dinner. Sometimes between the two meals we would go out for a ramble. There were several parks and open spaces in the vicinity, loved by Ruskin and Mendelsohn. Not far from our home there were lanes that still preserved a countrified aspect.

Whether we stayed at home or walked during a part of the time, we spent hours together, chatting and chaffing. Almost every phase of India came under review—the political phase, being the key phase, more than any other.

V

Now that he is gone, I am happy that I had all those talks with him at that time. He had just returned from his long exile in the United States of America. There he had deeply pondered Indian problems and debated them with men and women of high intellectual calibre who had no selfish interests at stake in our country and could therefore take a dispassionate view of men and matters. His views were so broad and refreshing that I wished that every Indian who aspired to be a leader could be compelled to live away from India for a time.

The determination to engage in the reconstruction of India had driven everything else from Lalaji's mind. He did not think very much of the Government of India Bill that Mr. Montagu had, with great exertion, got through the two Houses of Parliament. The opportunity it afforded for creating a new order in India was, he felt, very limited. He had however made up his mind, without taking much time to deliberate over the matter, to make the fullest possible use of every opportunity that that Legislation provided.

VI

Howmuchsoever we might regret the limitations and shortcomings of that Act, we must, he said, recognize that the war made it necessary for us to change

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

attitude—our methods of work—our entire life. We must take the maximum advantage of every opportunity that had been given to us, no matter how small it might be.

I asked him what he would have our countrymen do. He replied in one word—"Organize—Organize!"

"How?" I enquired.

"Most important of all in organizing at the present moment," he replied, "is for the leaders to get down from the pedestals on which they have been standing. They must identify themselves with the people—the common people—the commonest people. They must talk to them as if they were ordinary people themselves—not talk *at* them—not preach to them in pretty platitudes. This was no time for sugary talk. The people must be approached in their own language. The profoundest principles of political economy must be stated in the homeliest phrases—in Indian similes and metaphors."

His stay in the States had democratized him. The common people—a phrase often in Abraham Lincoln's mouth—mattered to him more than the intelligentsia.

"Our countrymen and countrywomen are uncommonly shrewd," he said. "Only we have shown them the cold shoulder. When we have tried to interest them we have forgotten that they—and we, too, were Indians and therefore the figures of speech and the illustrations that we employed should be Indian—not Addisonian English. If we are to make a success of the new era in India we must 'come down from our perch,' as they say in America. We must learn the language of the electors and give them political economy in a form that they can digest and assimilate.

"The centre of propaganda must be the village, so long as the village remains the unit of life in our land. If I could have my way I would have the so-called 'educated Indians' settle down in villages and take up agriculture and crafts.

"I would not draw the line even at boot-making. It would, in any case, pay them far better than clerking and they would be healthier. Even when I left the Panjab in 1914 it was very difficult to get a carpenter at one rupee a day, while educated young men found it difficult to secure work in office at a salary of fifteen rupees a month."

Lalaji emphasized the fact that he did not wish educated men to settle among the villagers because it would help to raise their financial status. That was merely by the way. On the contrary, he would have them do so in the interest of nationhood.

Only by some such sacrifice could the general level of intelligence in India be quickly raised. And our future could be safe-guarded only by a rapid rise in the general level of intelligence. He would even say that this was more important than all the other factors put together.

VII

He placed great emphasis upon the economic development of the country.

"The importance of the economic factor must never be permitted to be obscured," he warned me. "India is poor—horribly poor. So long as she remains horribly poor we cannot expect to succeed politically or in any other way. We must somehow manage to raise the general economic level of the people. That can be done only by means of intelligent and vigorous organization.

"Providence has richly dowered our land. We have large deposits of minerals. We have extensive forests containing almost every variety of wood. Our soil is rich as a rule and even when it is not, it yields large crops if properly fertilized and irrigated. We have plenty of materials with which to feed the soil and great resources for irrigation. We are so rich in all kinds of raw materials that foreign countries look to us to supply them with the means to accumulate vast wealth. We have abundant labour which, when trained, will not be inferior to labour elsewhere in the world."

Lalaji was happy that the development of industry had been made a "transferred subject" in the provinces. He feared however that the interested Britons would use their influence to have that provision whittled down in formulating the rules.

VIII

In his optimism he had not lost sight of the difficulties with which we would be confronted. He, on the contrary, warned me that

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

we would find ourselves terribly handicapped by the amount of illiteracy existing in India when we attempted to organize to raise the economic—or even the general—level of our people. He said:

"Life is, in the last analysis, indissolubly one. When you come to tackle the economic problem in India, you will find that you must have more and better education. When you endeavour to provide more and better education you will find that you must have more money. It is necessary for us therefore to organize all along the line—giving each department of life its due share of attention and starving none.

"More than likely we shall find, when we come to tackle the business of reorganizing life in India, that we shall need many foreign advisers. Japan found that she had to import them.

"She however never brought in a foreign expert when a Japanese could be found who would fill the requirements. Japan moreover always secured the services of a foreign expert on the tacit or distinct understanding that the most important part of his duties would be to eliminate himself as soon as possible by teaching a son of the soil to take his place."

IX

Lalaji agreed with me that India's future was entirely in Indian hands, to make or to mar it as they might choose. He declared:

"I have felt for many years that real reform must come from within—not from without. The only progress that can be abiding is progress that is built upon our national characteristics and traditions. Only by being true to ourselves can we possibly become a great nation—a nation that will make original contributions to the progress of other nations and not be a mere parasite upon others.

"I would have the best brains in the country take up research work of every description. I would have them burrow deep into the past—give us reliable history. I would have them study economic and social problems. I would have them thrust the probe deeply into disorders of every kind and discover and apply remedies that will cure those disorders.

"Indians alone can have the requisite interest to make a thorough investigation and to puzzle out the right solutions of Indian problems. First and last, the responsibility is ours. The honesty and vigour that we put into the discharge of that responsibility will decide the rapidity and character of our progress."

X

Lalaji had, at that time, great hopes of help from the Labour Party. Its star was then in the ascendant.

During the war many things had happened to give that Party prestige. Members of it who had begun their life at crafts regarded as humble had served as Cabinet Ministers. Labour had had representation even in the War Cabinet that controlled affairs during the most critical period of British history.

Lalaji had had the far sight to realize that the day was probably not far off when this party, composed of workers—mostly manual workers—would come into office. He also saw that the Liberal Party was doomed and that many Britons who had been proud to wear the Liberal label would join the Labour Party.

For these reasons he believed that it would be politic for Indians to cultivate the Labour Members of Parliament. In this matter his views coincided with those of Vithalbhai Javerbhai Patel, as I noted in another article.*

Lokamanya Bal Gangadhar Tilak was of a similar mind and had made a contribution from the Congress funds to the Labour Party's chest.

XI

I felt that in this matter Lalaji had been carried away by the emotional appeal made by Colonel Josiah Clement Wedgwood. The Minority Minute that that redoubtable fighter, whether with the guns in Gallipoli or with only verbal ammunition on the floor of the House of Commons, had insisted upon appending to the report made by his colleagues of the Commission that enquired into the Mesopotamian *debacle*, had created a profound impression upon Lajpat Rai's mind.

* This article was entitled: "A Fearless Fighter for Indian Freedom: A Pen-Picture of Vithalbhai Javerbhai Patel," and appeared in *The Modern Review* for December, 1933.

Digitized by Arya Samaj Foundation Chennai and eGangotri

From what he or Wedgwood—I now forget which—told me, the two had got into correspondence soon after the publication of that document which, it will be remembered, shook the entire Governmental structure of India to its foundations. Mr. (now Sir) Austen Chamberlain resigned his post as Secretary of State for India, as a point of honour, so I believe, he put it. His place was given to Mr. Edwin Samuel Montagu, who, from the Opposition Benches, had delivered a withering attack on the Government of India, describing it as "too wooden, too iron, too inelastic, too antediluvian, to be of any use for the purposes we have in view." (I quote from memory.)

The pronouncement of August, 1917, followed. Since it was not known, except to a small coterie of persons whose lips were sealed, that this declaration had been in hand before Mr. Chamberlain left the India Office, it was credited to Mr. Montagu, who, it was expected, would usher a new heaven and a new earth into India. The report that he issued in collaboration with Lord Chelmsford and others, belied those hopes. The Government of India Bill as Sir James (now Lord) Meston, Lord Sydenham and other friends of India, permitted it to be placed on the British Statute Book, proved to be an even greater disappointment.

But the impression prevailed that a beginning had been made by Mr. Montagu. Later, when Labour came into power, as it had been confidently expected it would before long, India would be given the opportunity at long last to manage her own affairs.

Wedgwood, who had become a recent convert to the Labour cause, certainly held such views. He often talked to me in that strain, sometimes at our house, sometimes at his flat and more often in the House of Commons. He must have poured the same tale into Lajpat Rai's ears.

Only those who know Colonel Wedgwood can form a correct estimate of his ability to infect others with his enthusiasm. He can be—and often is—very eloquent. If one attempt fails, he will make another and yet another until he has scored success. He will wait until he catches a person in the right mood.

I always have had an idea that Wedgwood had had no difficulty in making Lajpat Rai feel that Labour, when it ruled, would give Indians all they desired in the way of power to manage their own affairs in their own way. He would have found his Indian friend, after his return from the United States, in the right mood for it.

XII

Ben C. Spoor, too, would have exerted himself in the same way had he been in London. He had, however, gone to India accompanied, I seem to remember, by Holford Knight and one or two other near-M. P.'s, soon after the passage of the Montagu-Chelmsford Bill. "Uncle Arthur" Henderson, the Secretary of the Labour Party, had appointed him a sort of ambassador. He was to attend the Indian National Congress and there was some talk of the Congress making a considerable contribution to the political funds of the British Labour Party. I have a recollection that he secured the promise of a large sum of money: but the actual contribution was disappointingly small.

Mr. Ramsay MacDonald had not yet come out of the valley of the shadow of ignominy into which his pacificism had plunged him during the War. His trouble seemed to have made him kin to sufferers in every part of the globe.

Of the disabilities of our people he appeared then to be more acutely conscious than at any other period of his life. I remember his taking down from a high shelf in his study a dust-covered sheaf of manuscript one day when I was calling on him in his modest home in Belsize Park in north-west London, not far from a house I had once occupied there. It contained such caustic denunciation of the bureaucracy in India that when it was published the book was proscribed by the Government of India; and the ban was not lifted until Mr. MacDonald had for months been the Prime Minister of Britain.

It was therefore not at all presumptuous for an Indian publicist to feel that if Ramsay MacDonald should dominate the Labour Party instead of Henderson and the other Labour leaders, who, during his fall, had risen to heights theretofore unscaled by men of their party, he would befriend India. Lala Lajpat

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Rai certainly expected that he would do something if he ever came into power to rid the Government of India of the shortcomings with which he charged it and assist Indians to reach their political goal.

XIII

Probably journalism pursued for many years in Britain had made me *blasé*. By bringing me into intimate contact with many persons who were making history, it had taken away from me the capacity to become enthusiastic about them or their performances. Having seen how the Liberals behaved towards India when they came into power, I feared that Labour might do no better when it got the chance to implement the promises freely being given to Indians by men who could rightfully speak in its name.

I put this point of view before Lalaji : but he appeared to be completely under Wedgwood's spell.

I admitted, for the sake of argument, that if the Labour Party were composed entirely of Wedgwoods, and that Party were in power, the problem of Indian Swaraj might no longer be a problem. But that Party was not composed of Wedgwoods—unfortunately both for Britain and India. That I had cause to know.

Lalaji talked a great deal about the vested British interests in India. The owners of factories in Lancashire and other industrial counties of Britain had built up a large and paying business after their people gained political power in our country. They were naturally anxious to preserve it as long as they could.

He seemed to forget however that if a factory in Britain had an owner, it had workers, too. There were a hundred and perhaps a thousand workmen for each owner. They were as much interested in the Indian market as their masters. For these reasons, when the time came to give India self-government they might be as much opposed to doing so as the capitalists. They would fear that Indians might use the power given to them to put tariffs on British goods—to alter the exchange ratio between the rupee and the pound. When the time came for action the Labour Party might hesitate as much as the Liberals and Tories.

XIV

Lalaji found it impossible, upon his return to India, to put into effect the ideas and schemes that he and I had discussed in my study at Herne Hill. Our people were disappointed and enraged at the way His Majesty's Government had permitted the officials implicated in the Panjab horrors to escape almost scot-free. The special session of the Indian National Congress held with him as its President decided to non-co-operate with the authorities.

Lajpat Rai felt that the British Government had committed a great blunder. In more than one letter that I received from him from Lahore he urged me to exert myself to secure justice for the Panjab.

He started a newspaper from Lahore and called it *Bande Mataram*. It was to be conducted in Urdu. Some of his Arya Samaj friends must have been disappointed that he did not choose Hindi as the medium for the purpose. Others may have felt that a paper in English would have been of greater utility.

He had other views however. A paper conducted in Urdu, he felt, would enable him to reach the masses in the Panjab more effectively than one printed either in Hindi or in English.

He had meant, in any case, to have also an English organ. *The People*, which he started a little later, was to be a high class weekly which, like the *Nation* of New York or its namesake in London, would play an important rôle in moulding Indian opinion in the cause of freedom. He expected to receive literary support from his friends and make it into "a first class periodical." That he gave me to understand, was his ambition.

XV

In one of our numerous conversations I had told Lalaji that it was ridiculous that editors of newspapers in India should depend upon non-Indians for their London letters. "How are we to convince the British of our ability to run our own affairs in India," I asked, "if we cannot be self-sufficing in a matter like this ?"

There might have been some excuse for hiring non-Indians to do work of this description a generation or more ago, when the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

were few Indians in Britain. But this was no longer the case.

And where are we to find a man like William Digby in this day and age?

I recalled to his mind Japan, where he had spent some time. "Would the editor of a newspaper of any importance in that country delegate such a task to a non-Japanese in Britain or the United States of America?" I asked him.

Lalaji agreed with me as to the incongruity of hiring non-Indians, however sympathetic they might be, to select and to purvey news affecting India to the Indian public.

The talk ended there. I forgot all about it the next moment.

Not so Lalaji however. As soon as he had started the *Bande Mataram* he asked me to be his London correspondent.

I found myself in a difficult position. I was up to my eyes in work—much of it of a highly remunerative character. Yet how could I refuse my friend's request, especially when he reminded me of what I myself had said on this subject some years earlier.

XVI

I kept up the connection as best I could, until I pulled up stakes in London in the autumn of 1921, to set out on a comprehensive tour of Ceylon and India. I got to Lahore about the middle of the following February, by when Lalaji was behind the bars.

Through the courtesy of Sir Edward Maclagan, the then Governor of the Panjab, I was enabled to see him in prison. I had known Sir Edward for many years and liked him so much that I had used all the journalistic influence I possessed through the columns of British newspapers to counter a sinister move that was directed against him in 1920. Some powerful British reactionaries had suggested that he was too weak a man to be placed in charge of the Panjab so soon after the terrible events of 1919. They insisted that Sir Michael O'Dwyer's term of office must be extended to enable him to deal with the delicate situation there. I was very happy that Mr. Montagu refused to listen to such perverse counsel.

Sir Edward readily acceded to my request. I was lunching with him and Lady Maclagan at the Government House in Lahore at the time. He rose from the table, went to the telephone and personally arranged for me to meet my friend.

When my motor drew up outside the jail gate, the Assistant Jailor met me and conducted me to Lalaji, who had been told that I was coming and was expecting me. I spent the best part of the afternoon with him.

His cell was small, bare and uncomfortable, though quite clean and rather well lit. He had some books to read: but so far as I can now recollect, no newspapers.

Before I left, the afternoon meal was served to the prisoners. The *roti* issued to even the "political prisoners," judging by the specimen I was shown, was coarse and poor. I should not like to feed it even to cattle.

I was so shocked that I took a bit of the leather-like bread away with me to show to Mr. Montagu when I returned to London. Alas! that object was never fulfilled. Before I returned he, poor fellow, had fallen out with Mr. Lloyd George and had been hounded out of office.

So far as I could learn, Lalaji was treated well in jail. The prison officials were all deferential in their attitude towards him. He told me that he received every consideration and that the jail regulations were administered with leniency so far as he was concerned.

But he complained that he was not officially recognized as a "political prisoner." He felt that as a matter of principle, he should have been. And above all he was a man of principle.

He told me that the "inside knowledge" of prison life that he had gained from imprisonment in the Central Jail in Lahore was most revolting to him. He gave me this bit of information in front of the Assistant Jailor who was acting as my escort and added that when he was released he meant to work for prison reform. This he did.

XVII

This proved to be my first and last meeting with Lala Lajpat Rai in India. I had to depart almost immediately for western and southern India, where work was waiting for me. By the time it was finished, my health was completely undermined. I was practically

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

carried on board the S. S. *Morea* bound for England, in June, 1923. My continued ill-health kept me travelling here and there until 1926, when, upon a flying visit to London, I found Lalaji was also there for a few days.

He had by this time changed his policy of non-co-operation to the point of going to Geneva as a Labour representative at the International Labour Convention. His action gave umbrage to many of our people. Strongly-worded protests were made. They cut him—ever hypersensitive—to the quick.

One evening we dined together at the National Liberal Club. My wife told him that we were contemplating going to Ceylon, where friends were trying to persuade him to take over the editorship of a daily paper.

Lalaji chided me in the strongest terms for even contemplating such an idea. He could, he said, quite conceive my remaining away from India for the sake of engaging in "foreign work," in behalf of the Motherland, as I had been doing for so many years. He attached great importance to that work, he said. But if I had grown tired of world-wandering I should, he insisted, settle down somewhere in India, and not in Ceylon. He always spoke of that land as "Ceylone," as if the last syllable was the same as the English word "tone."

"India has the first claim on you," he scolded. "You must not think of going to Ceylon, and assuming an editorship there. Promise me that you will not go. Give me your word that you will withdraw from any arrangement that you may have made."

He proceeded to enlarge, in his inimitable way, upon the opportunities for service to our country that would be open to me were I to settle down in India after my many years of journalism in Asia, America, Europe and Africa.

"Why," he declared, "you could have as many newspapers in India to edit as you might wish. If you tell me how many lakhs you would need to start a paper of your own, or a string of papers, I will guarantee to collect the money for you without any delay. Not that you stand in need of such help from me or from anyone else."

Even now, eight years later, I still feel the power of his appeal. I felt like saying: "All right, my friend. I will give up all the plans for touring America and the Far East and go straight to India."

The commitments that I had made however steadied me. I told him that I had gone too far with my plans to cancel the tour on the spur of the moment. But while I was on my way to Ceylon I would think over the matter in the light of what he had said and if conditions in Colombo did not please me upon my arrival, I would not permit myself to become entangled in editorial responsibility there.

"That is a promise, then," he cried. In his emotional way he held out his hand and shook mine with great warmth in token of the bargain. He was not through with the subject however. He referred to it again a little later and made me give him my word that if, perchance, I took up the editorship in Colombo, which he was now convinced I would not, I would let him send one of his men to me to be trained in journalism. "You will have to pay at least that price for your perverseness," he said, laughing. I readily assented.

As matters turned out, I perceived, on reaching Colombo in March, 1927, that I would be making the mistake of my life if I accepted the editorship that I had been persuaded, against my better judgment, to consider. The friend who had been so determined that I should take up the work kindly released me. Lalaji's will prevailed in the long run.

XVIII

Lajpat Rai was as fond of ices as a school-boy. He had, in fact, managed to retain the enthusiasm of youth despite his detention in Mandalay, his incarceration in the Lahore Jail, his continued ill-health and his great responsibilities as a publicist. He tried to tempt me to have a third ice—with some strawberries—or at least to share another one with him. Suddenly he remarked:

"In one way I am glad that you are going to Colombo. That will give me an excuse to visit Ceylon."

My wife immediately extracted from him a promise to come and visit us as soon as we had settled down there. We three, she declared, would set out on a journey of exploration—in the footsteps of Sita, Rama and Lakshmana.

Ceylon had interested me for a quarter

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

a century. I had for years wished to study the people who, with a few exceptions, were of Indian descent. I was anxious to discover what use they had made of the cultural nucleus they had received from Mother India. There were nearly a million Indians in the Island, mostly engaged in work for which the indigenous population had no stomach. Or was it that they lacked the backbone for it? I desired to learn all there was to know about them.

Constitutional changes were, moreover, impending. I wondered if Ceylon would fare better than India in that matter.

I decided therefore to remain for some time in the Island and make a thorough study of it and its inhabitants, be they Indian or the near-Indian Sinhalese. I found the country so lovely and the people so ingratiating that I actually stayed there a little more than three-and-a-half years.

Lalaji repeated his promise to come to us for a visit. When he went to Malabar in 1928 Mrs. St. Nihal Singh and I fully expected that he would fulfil that promise. It, however, was not meant to be. He wrote me a letter in which he explained:

"I do plead guilty to the charge you have brought against me of not having visited Ceylon while I was so near it in April last. The fact is that it was so hot that I repented having ever accepted an invitation to visit (the) Madras (Presidency) in those days. I am very much desirous of coming to Ceylon for a few days, if not more, and of course your presence there is an additional attraction. But I do not know when I will be able to do so, as I am always busy in something or other."

Not long after that letter was received, the *lathi* blows fell upon my dear friend, hurling him into eternity many years before his time. Five years have come and gone. His place in my heart and in Indian public life is still empty.

How lavishly he gave of his best to Mother India!

POST-WAR CHANGES IN ENGLAND'S FOREIGN TRADE

By SASADHAR SINHA, B. SC., ECON., PH. D. ECON. (London)

ENGLAND'S economic crisis today is in many ways unique. Although its high watermark has coincided with the present world depression, it should be borne in mind that her economic malaise has been more or less persistent for the last ten years. The presence of unusually heavy unemployment, which since 1922 has never fallen below a million and which recently reached nearly three millions, is the most striking indication of the seriousness of Britain's economic ill-health. A fact of equal importance is the gradual shift of her economic centre of gravity from the North to the South. The decline of the industrial North, the backbone of England's prosperity in the nineteenth century, is a clear warning that her economic structure is in the grip of a radical transformation. A glance at the distribution of unemployment among the various industries during the last decade will bear testimony to this fact. Between 1925-30, for example, a typical northern industry, coal, which represents about one-tenth of the insured population, was responsible for nearly one-sixth of the total unemployment. It is well to remember that since the War the character of international demand for manufactured goods has undergone an important change. The tilting of the balance in favour of the South partly illustrates this shift in demand. It is the home of England's modern industries like automobile, electrical engineering, etc. Indeed, it is one of the reasons why throughout the depression the South has been relatively prosperous and the number of unemployed in this region is the lowest in England. None the less Britain's chronic unemployment not only shows that her new industries have failed to compensate for the losses of her older industries, but that their progress has not been commensurate with the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

progress made by similar industries elsewhere. "Today what is really important and significant in England is not the depression of the depressed industries, but the relatively small progress made by the relatively prosperous."*

It is necessary to go back a little in history to realize the real nature of the change that has overtaken the internal economy of England. Until the War, England's industries were unsurpassed. Although her visible balance of trade continued to be unfavourable, it was the natural consequence of her prosperity, for as the largest investor of capital abroad she held the world to fee; but her industrial pre-eminence was still the basis of her economic strength. Already before the War there appeared causes for anxiety—the growth of rival centres of industry was one of them, but as long as she continued to prosper these were not taken seriously. The advent of the War and the post-War industrial boom by affording false security only served to postpone the inevitable day of reckoning. The following figures (*cf.* Macmillan Report) will show that the volume of England's foreign trade, far from making any progress, has even failed to retain its pre-war level.

	1913	1930	precentage increase (+) or decrease (—) in volume
Imports	£659 millions	£958 millions	+ 18 p. c.
Exports	£525 „	£571 „	— 32 p. c.

Since the War England has reached a new economic equilibrium. The prosperity of her export trade has been replaced by adversity. Almost imperceptibly she has become dangerously dependent on her shipping, overseas investments and other commercial and financial operations. "Invisible" exports now occupy greater prominence in Britain's trade balance-sheet.† Thus, although her incomes from the "invisible" items have e... abled her to finance her imports and undoub... edly contributed to her economic stabili... this has been possible only at the expen... of the total credit balanee available for r... investment. Furthermore, with the shrinkag... of the export trade, industrial profits hav... steadily decreased; consequentiy contra... to the pre-war practice, for capital devel... ment Britain's domestic industries f... themselves at the mercy of the financiers. T... has involved a corresponding decrease ... investments overseas. The pre-war positi... has been exactly reversed.* Indeed, t... direct monetary liability undertaken by t... financial interests in the industries at ho... is a significant post-War development. Th... is little doubt that the recent fiscal chan... in England have been considerably facilita... by this circumstance. Subsequent events, however, showed that she had maintained her position best on the Continent. Her greatest losses were sustained in Asia and America. The continental currency depreciation was the whipping-boy for a time, but this also proved illusory. According to Mr. Loveday, since the War England has lost everywhere, "to the great and the small, to the financially pure and the financially reprobate, but primarily to the United States."

In any true estimate of the causes of Britain's industrial changes the fortuitous must be separated from the permanent. Among the latter the first place must be given to the fact that she no longer occupies the unique position she once held. The supremacy of her coal, Britain's largest export in bulk, has been challenged by oil and hydro-electricity. Rival centres of iron and steel have sprung up in three continents. Her cotton and woollen industries have been similarly assailed. The world's productive capacity has enormously increased, but not so the population of the world. England finds herself faced with younger rivals everywhere.

The rigidity of her economic organization too must bear its fair share of blame for the arrested economic development of England. Her major industries are old-fashioned. Coal is a classic example. Its scale of production is often too small to be economic.* Even at this late hour the short-sighted individualism of the coal-owners makes a thoroughgoing rationalization of the industry impossible. In the second place, the overvaluation of the pound in 1925 impaired England's competitive position by increasing the cost of production. But, as Professor T. E. Gregory has pointed out, it would be misleading to hold the exchange position as directly responsible for all her difficulties since England's return to gold. "A most complicated economic and political situation cannot be so simply explained." (*The Gold Standard and its Future*, Methuen, 1932). Finally, the rigidity of wages in face of falling prices further handicapped the British employer. The "defeat of the cheaper by dearer peoples, the victory of the man whose food cost four shillings over the man whose food cost four pence," as Dilke wrote nearly forty years ago, is only partially true of England today. By a curious irony, in the twentieth century, his own country has lost ground to countries belonging both to dearer and cheaper peoples. England's industrial efficiency has no doubt improved, as the Macmillan Report has noted, but clearly it has neither been uniform nor has it always kept pace with the rise of wages, though the balance has been partly restored since England's departure from gold in 1931 combined with the policy of retrenchment.

In recent years the growth of economic nationalism has added to England's embarrassment. The multiplication of tariff barriers by cramping the free movement of international trade has jeopardized her economic recovery. England is on the defensive. The dream of Joseph Chamberlain has at last come true. She has turned to protection. Instead of overhauling her economic structure to answer present-day needs, by substituting flexibility for rigidity, she has deliberately set her face against the world outside the Empire and entered upon a phase of Imperial co-operation based upon mutual reciprocity. But the absurdity of the situation is obvious. For, "statesmen who describe the pouring in of foreign goods into Britain as if the goods were a destructive pest to be kept out by defences, and in the same speech urge development of imperial trade as a mutual enrichment, may not be conscious of how much mental agility they have." (Tariffs, etc., *op. cit.*) To the degree that the self-governing Dominions themselves are developing their own industries under protection, they cannot, indeed will not, grant any real preference to England; nor can England forgo her trade outside the Empire unless she is convinced that her losses outside will find adequate compensation within the Empire. England knows only too well that the Ottawa Agreement with the Dominions has been a costly adventure. England's huge international trade ill goes with whole-hog protection, nor is her internal market large enough even partially to compensate for her loss of markets abroad. The reaction of tariffs on England's shipping and entrepôt

* Compare England's 1400 independent undertakings working 2000 or more pits with a dozen companies controlling 90 per cent. of the production of Westphalian coal.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

trade, affected as they already are by the decline of her foreign trade and the post-war tendency for manufactureres to deal directly with the producers of raw materials, on the other hand, will deprive her of huge incomes and further dislocate the labour market.

With the passing away of the world-wide depression England's economic position will gradually improve in common with the rest of the world. But for the present purpose the symptoms of a more permanent disease, which has afflicted her, even during the relatively prosperous period ending in 1929, are more important. It is possible, indeed probable, that certain industries, notably textiles, will never see the return of their hey-day. Coal also is not expected to regain its former prosperity. The almost national jubilation over the recent plan for production of synthetic petroleum from coal is thus due as much to the desire to find an alternative use for coal to compensate for its loss of market abroad as to the desire to see the country independent of foreign supplies of oil in times of war. To more discerning observers it is already clear that the future of England as an industrial nation is bound up with the fortunes of her newer industries—automobile, electrical engineering, etc. True, in her desperate desire to protect her declining industries against foreign onslaughts she has sought the remedy of tariffs, but with the departure from gold there has ceased to exist even a theoretical justification for this step. England's greatest need today is greater flexibility of economic organization—greater sensitiveness to world demand. "Protection is at bottom always a policy of resisting change, of accepting and condoning rigidities." In the long run it will make the process of readjustment all the harder for England.

RAJA RAMMOHUN ROY

By Sir BRAJENDRANATH SEAL

In the panorama of modern culture and civilization three peaks stand out prominently. The first is represented by Rammohun Roy. He was the harbinger of the idea of Universal Humanism. Though Voltaire and Volney had a glimpse of the rising sun of Humanism, they distorted the view by pitting the East against the West, and minimizing and traducing Christian culture. Theirs was a militant humanism, as opposed to the Rajah's synthetic and universalistic point of view. It is interesting to note here that a third stage was reached on this line in the creed of Neo-theophilanthropy conceived as a new love of God and man. The second peak is represented by Tolstoi and Gandhi with their gospel of passive resistance and non-violent non-co-operation. The third peak in this panorama is represented by the modern movement of scientific humanism leading to cosmic humanism.

Let us take these movements in the order just mentioned. The first is represented by Rammohun Roy's idea of Universal Humanism. As I have said elsewhere, Raja Rammohun Roy was a Brahmin of Brahmins. He was also a Muhammadan with Muhammadans and a Christian with Christians. He could thus combine in his personal religion the fundamentals of Hindu, Christian and Islamic experiences. In this way he was, strange to say, multi-personal. But behind all these masks there was yet another Rammohun Roy, the humanist, pure and simple, watching the procession of Universal Humanity in Universal History.

He strove to reconcile opposites. In the sphere of speculation he sought to reconcile individual reason with collective wisdom and scriptural authority, while in the sphere of social construction he aimed at the reconciliation of the good of the individual with the good of the greatest number. Thus he tried to harmonize individualism with socialism. This harmonization, which is a necessity of life, has been attempted in different cultures in different ways. I may mention, *en passant*, that this balancing of what may be termed in a general sense individualism and socialism was a fundamental note of certain ancient civilizations, for example, the Dravidian and the Aryan. In the former, an original leaning towards socialism was corrected by a counter-emphasis on individualism, while in the latter a radical stress on individualism was tempered by socialism. The same process of counter-balancing is observable today in the capitalistic and socialistic polities of the West, where capitalism is being corrected by socialistic legislation and taxation (as in Britain and America), and on the other hand socialism, where it has been adopted as the basic principle (as in Russia), is being tempered by individualistic principles.

While Rammohun Roy was thus laying the foundation of the comparative method as applied to the study of Religion and Culture history, he made two profoundly original contributions of high practical import:

(1) He helped to establish public education in India on the basis of real and useful knowledge, more particularly of science and the application of science to industry.

(2) He made a forecast of the future political history of India and her relation to Great Britain on plantation (or, colonial) lines. Indeed he would even welcome high-grade European settlements in certain parts of the country as a tentative measure to hasten this consummation. But the march of history has another

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the practicability as well as the value of this suggestion.

The second peak, as I have said, is represented by Tolstoi and Gandhi (though Shelley had anticipated them). Here the fundamental principles are Passive Resistance, *Philosophical* Anarchism and Non-violent Non-co-operation. It was Tolstoi who interpreted Christ's teachings as embodying the quintessence of passive resistance as applied to the whole of life. This has been followed by the concept of philosophical anarchism which rejects the very idea of government, and it does not merely confine itself to Herbert Spencer's principle of mutual non-interference as the basis of legislation, but is so interpreted as to imply a total rejection of all legislative authority and sanction. Gandhi rejects this philosophical anarchism and has crystallized passive resistance into non-violent non-co-operation, rejecting all use of force and preaching the doctrine of suffering as the only means for the conversion of the resisting factors. Thus, it is claimed on behalf of this triple movement that it has promulgated a new gospel of deliverance for Universal Humanity.

I may here note that the Rajah's survey of religion can find an easy place for all these later varieties of belief and experience.

We now come to the third peak. This represents a new religion—the Religion of Man. Here (as for example in Julian Huxley's attempted rehabilitation) we shall find the usual paraphernalia of religion with divers symbols, rites, observances and dogmas, replacing the existing religious institutions and codes. It aims at placing the internal relations of society on a positive scientific basis, ousting the Gods of the extant credal religions ; and it is confidently asserted that it will form the creed of a universal humanism based on Science. Eddington, Jeans, Bertrand Russell and Whitehead are the British protagonists of these movements of thought which seek to liberate man from the dominance of the old creeds and dogmas.

Here also it may be noted that the Rajah's survey of religion can find an easy place for all these varieties of belief and experience.

But Science is not the whole of life : other phases —the emotional, the socio-ethical and the spiritual— must also be given a proper foundation and structure in the organization of life. Thus, scientific humanism is only the vestibule of the cosmic humanism of the future.

Such would be the outcome of the Rajah's survey of human history. And it was Rammohun Roy who had a glimpse of this rising sun. It was he indeed who viewed from dizzier heights the procession of universal humanity in universal history.

And in the end, as I have said elsewhere, there came to this prophet of Humanity on his death-bed the vision of a free, puissant and enlightened India, the civilizer and enlightener of Asiatic nationalities, a golden link between the Far East and the Far West, a vision as emblematic of the past, as it was prophetic of the future history of humanity.

But the old order changes and the race grows evermore. Yet Rammohun Roy shall be honoured as the prophet and precursor of Universal Humanism.

Retrospect And Prospect.

Retrospect.

But there are deeper reaches than all this. For, what enters into the norm of modern life is not merely emotional exaltation, not merely imaginative transfiguration, not merely a disinterested criticism of life, but also, in and through them all, the creation of a personality with an individual scheme of life, and an individual outlook on the Universe. And it is only faint streaks of a new light that we see on the horizon.

The Coming Order

The individual personality will grow more and more multi-personal. The hero indeed will be transformed. In this process, the idea of mass-consciousness will be the first stage, wherein everything in life and art will be evaluated in terms of the mass life. In other words, the needs of the masses, and not of the individual, will be the primary and guiding concept and measure of value. In the next stage this will develop into the concept of the Community-consciousness, wherein the life of the community will be the guiding principle of all life constructions. This community-consciousness is the consciousness of a more organized body than the masses. The next stage in this development will be the concept of Race-consciousness, in other words, the idea of the race as the centre of all values and organic constructions. The final step will be reached when all these elements will be synthetized and concretized in the concept of the Age (and the march of ages) as embracing the whole field of life. This will transform the entire panorama of life and art, bringing on a transvaluation of all values and elevating art to new heights and undreamt of altitudes. *

* This Address was delivered at the last Centenary Celebrations of Raja Rammohun Roy.

THE PROGRESSIVE UNDERSTANDING OF POETRY

The Spiritual Shelley

By ELIZABETH GILLESPIE

IT is not only on the physical globe that a Columbus in the Middle Ages, a Shackleton in the nineteenth century and a Piccard in the twentieth, can discover new worlds. In the universe of literature also adventurers essay voyages of exploration in the world of song created by master minds.

When artists are recognized as having been born "before their time," it is reasonable to expect that their works will reveal their true value increasingly as time passes by. The expectation has been abundantly fulfilled in the history of literature. One especially expects to find still unsounded depths in the concentrated, almost cryptic, art of poetry.

Leaving aside Shakespeare, whom the world has been exploring for three hundred years, Blake, Browning and Whitman are still subjects of research, and repay their investigators with "re-visions of the ruby and the rose."

Percy Bysshe Shelley, however, has been more thoroughly spurned and more heartily loved than probably any other English poet. Yet, from his entrance into publication in 1812 right up to today, there has been a distinct evolution of understanding and knowledge of this master poet, a process of unfoldment of his meaning and message parallel with the growth of higher consciousness in the reading public, and with increasing freedom from prejudice in the critics and a finer quality of literary criticism.

Shelley is, in an even larger sense than Edmund Spenser, a "poet's poet," and needs a true poet-critic as his exponent. But, with a couple of inadequate exceptions like Matthew Arnold and Stopford Brooke, his outstanding critics and commentators have not in the past been themselves poets. It has remained for an Irish poet resident in India to discover to the world a new Shelley in the book which has inspired this article. In "The Work Promethean" Dr. James H. Cousins shows Shelley as himself the Prometheus of his great drama, the bringer of illumination and warmth into the darkness and cold distrust of his time. In view of the high place that this new work is sure to take in the world of literature, it is a matter for gratification to Indians that its author has elected to give it to the world through an Indian publishing house; and a novel feature of the interpretations and applications of Shelley's poetry which Dr. Cousins makes is the constant reference to Indian lore and experience of things of the spirit.

Shelley himself realized that one aspect of the work Promethean would be a growing capacity in humanity for interpretative exposition of symbolism in nature, art and literature. "The progressive understanding" of any great creative artist or work of art is in itself an alluring theme apart from the specific personality chosen for study. Can one read more into a creation than its creator knew? There has recently been much exploration into the "fountains" (AE's phrase) of literary genius. There is still a school of English literary thought which does not consider it "the thing" for a poet to be a philosopher, to have a message or a vision or a mission. "Art for art's sake" is not yet an out-of-date slogan. It is "bad form" in European society to wear one's heart on one's sleeve, to speak of God or the soul, or to plead guilty to possessing a spiritual ideal. In the sessions of the League of Nations such words as spiritual, religious, eternal, are taboo, and if used exceptionally are translated as moral or ethical. But the major artists are always true fundamentalists—probers into problems, philosophers and preachers, like Wordsworth, Francis Thompson, Dickens, Wells, Shaw, Leonardo, Wagner, Scriabine, Tagore. It was Shelley who claimed for poets as "the unacknowledged legislators of mankind." He felt that his own poetry

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Might shake the anarch Custom's reign,
And charm the minds of men to Truth's own sway.

It has been the happy fate of Dr Cousins to discover, and to display in literary criticism of the rarest quality, what Shelley took to be Truth. The Irish poet-critic uses the X-ray apparatus of his own intensive knowledge of every line that Shelley wrote, operated by his own spiritual wisdom and intellectual culture, not merely to lay bare the significance of Shelley's poetry, but to trace back through the foliage of beauty to the root-Shelley, Shelley the Thinker. Through his own sight of that root each reader of Shelley may realize from what essential Being have come forth the immortal flowers of lyric and drama which now command a premier place in English poetry, though they were truly valued by perhaps fifty people at his death just over a century ago.

Dr. Cousins has made a character in his own lovely drama, "The King's Wife," exclaim: "Only a poet is jealous of a poet." But that must only hold true in the case of poets contemporaneous in place and language. One remembers, on the other hand, the enthusiasm of Yeats for Tagore, of Shelley for Keats; and it is the enthusiasm of the poet Cousins for the poet Shelley that gives the bright energy which pulses through a literary study which might easily have been heavy or dull.

The richness of Dr. Cousins' own mystical, poetic and creative nature enables him to bring to view the hinterlands of thought behind the words used by Shelley. Many a lover of Shelley may realize and rejoice in Shelley's affirmations of "the vision splendid" and yet not be able to express that appreciation. To such this volume will be a God-send, for the critic brings to the life-work of the poet the searchlight of his careful, thorough study of materials, his intuitive flair for interpretation, his mystically endowed mental equipment, his own wealth of wisdom and beauty of expression, all expressed in choice language and vivid and epigrammatic style.

Literary criticism is by its nature derivative; yet its subject may set up such an induced current of inspiration that the critique itself becomes a piece of creative literature. This will certainly be the verdict passed by all but those who are bound to the vested interests of traditional criticism, on this always profound and often dazzling interpretation of the basic Shelley.

The vast allegorical poem-drama, "Prometheus Unbound," was the flower of Shelley's genius into which he put the very essence of his life; and Cousins wisely bases his analysis of the fundamentally spiritual Shelley on this work, with reinforcing cross-references to others of Shelley's great poems. Mary Shelley had given the clue to the drama by writing of it: "It requires a mind as subtle and penetrating as his own to understand the mystic meanings scattered through the poem. They elude the ordinary reader by their abstraction and delicacy of distinction, but they are far from vague."

Dr. Cousins is the proverbial fighting Irishman in this new elucidation of the supreme genius of Shelley and interpretation of his major works. He tilts at high and low among the former evaluators of Shelley. He marshals his men in chronological orders from Thomas Carlyle to Sir Henry Newbolt and Aldous Huxley. He proves by convincing quotations how the passage of time raised Shelley from being the expelled Oxonian "atheist," then the "ineffectual angel," later the "hectic, shrill and pallid being," after that the writer of "romantic love affairs," until W. B. Yeats, a true interpreter of the spiritual Shelley, closes "Prometheus Unbound" as a "sacred book." Having put the critics in their ascending grades of inadequacy, Cousins himself starts off from Mary Shelley's clue and piles up evidence and interpretation which cause Shelley to emerge as one of the order of world-liberators with a gospel that "Love, not man, is superior to law, and only when Man-in-the-highest, Man Promethean, is governed solely and completely by Love can he safely be set free from Law (Jupiter)."

Shelley is disclosed in "The Work Promethean" not as a visionary, but as a man with a vision, a seer, a prophet, a preacher, clear and plain to his own mind, capable of being seen equally, clearly by readers of the calibre of his latest eulogist and interpreter, and by lesser minds who now have this "open sesame" in their hands. Not only so, but Shelley is shown as his own ideal of Prometheus in his exposition of how his formula of regenerated society would

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

act, and so we are guided to the Veda of Shelley in its application to aspects of life—love, thought, freedom, will, equality—by this Irish-Indian Upanishad.

The unique chapter of interpretation, cosmic general and individual, of "Prometheus Unbound" is so closely knit, so intellectually presented, so beautifully expressed, and goes so much deeper than previous expositions in its masterly interpretation of the ancient Promethean myth as resung for the modern and future world by Shelley, that it must be read as a whole at one sitting, and no student of Shelley or of the advancement of humanity can afford to remain without knowledge of it.

Shelley is shown by Cousins as a worshipper of a Being

> Which wields the world with never wearied love,
> Sustains it from beneath and kindles it above,

and later in the poem that Being is definitely called "Almighty God" and "Merciful God." Thus falls away the label "atheist" which so long damned Shelley. The label "pantheist" is also removed by quotations which show that Shelley clearly voices the retention of individuality after death even when he sings of Adonais as being "a portion of that loveliness once he made more lovely" but immediately follows it with the assertion that

> he doth bear
> His part, while the One Spirit's plastic stress
> Sweeps through the dull dense world.

As a thinker, even in the realm of physical science, Shelley is shown to have been a pioneer of the scientific doctrine of evolution, ante-dating Darwin by thirty years; stating, as Cousins says, "the clearest science, but stating it gloriously, on the wing." The discovery of evolution in "Adonais," of the three *yogas* of India in "Prometheus Unbound," and of the Shelleyan aesthetic in an "unrhymed sonnet" in that same poem, are proofs of literary and philosophical acumen of a unique kind.

It is part of the charm of this new way in literary criticism that over and over again we see the working poet of today with all the experience of a creative artist making us realize the importance of each word, each nuance of expression, in Shelley. "In the realm of poetry," Cousins writes, "whose appeal is less to the emotions and more to the mind than music, clarity of statement is essential quality. Yet there is a stage beyo which the demand for clarity in poetry may a demand for something other than poetry stage where external expression is incapable carrying the whole offering of inner meanin and words have to bear on one shoulder th image immediately invoked, and on the oth the sometimes shadowy, sometimes shinin shapes of thoughts and feelings seekin incarnation in the always inadequate bodies speech."

Poets crowd whole realms of thought i single words in special connotations. Thi is a more synthetical art than the musician The latter is inspired with a seed melo and unfolds it by sequences and contras but the poet keeps pressing the *multum* i the *parvo*: his is the art of literary synthe

> Compacting to an instant's glance
> All that through sight the senses stirred
> Hushing life's myriad utterance
> Back to the all-enfolding Word.

It is only those who realize this by ex cising the poet's craft themselves, or by be in close contact with poets, who can m valuably interpret the words and expressi which Shelley economically and eclectic chose.

"At the stage of interpretation," s Cousins, "verbal sounds take on overtones intuitive assumption, tinctures from a myr forgotten feelings, memories of long-dismar edifices of thought, undertones of unrecog experience." Shelley himself expected future to expand to an adequate understan of the implications of closely packed thou He spoke of the augmentation of signific which would accrue to high poetry. wealth of original exposition which Work Promethean" contains proves the cor ness of Shelley's prophecy. A sp instance of this is the discovery of the alm mentioned "unrhymed sonnet" in "Prometh Unbound" as the chalice holding the expression of Shelley's ideas on the arts origin, their function in the cosmic opera their relationship with humanity, and conditions of their progress." The transl tion of this "scanty plot of ground" Cousins' Japanese miniature garden exposition, is an act of literary magic allurement all its own. And closing it i

explanation of the æsthetical pleasure of creative literary analysis: "There is a special joy of the spirit in mentally separating the apparent complexity of the garden into its several plots for the fuller enjoyment of each, and for attaining through this analytical process the paradox of an ultimately simple and radiant understanding."

It is appropriate that India should be the place of birth of this new discovery of the essential Shelley, for Shelley knew the spiritual stature of India, and knew also of its characteristic doctrines, such as rebirth, the world of the celestials, the One Life, etc. It will be a novel experience for Western students to find India elucidating and corroborating the English poet. Dr. Cousins is uniquely equipped for such hemispherical cross-references by his Celtic nature, which delights in myth and its interpretation, and by his long residence in India and his "identity of spirit" with India and Shelley. Perhaps such an exposition of the progressive understanding of poetry as is this volume is just the kind of world-service that this deeply spiritual country can make as an aspect of its spiritual leadership of the world.

THE PROBLEM OF IRRIGATION IN BENGAL

By SUKUMAR RANJAN DAS, M.A., PH. D.

In describing the present condition of Bengal villages Deshbandhu Chitta Ranjan Das once remarked:

"Today that peasant is gone—his breed extinct; gone too is that household with its ordered and peaceful economy of life. The granaries are empty of their golden wealth; the kine are dry and give no milk; and the fields, once so green, are dry and parched with thirst. The tanks have dried up; their water has become blackish and unwholesome and the peasant has lost his natural freshness and gaiety of temperament."*

Such is the condition of health and agriculture of Bengal villages. The problem of their reconstruction is enormous and complex. They were not unhealthy half a century ago. They were prosperous and held a high position in agriculture, trade and commerce. The main cause of this deterioration is the insidious attack of Malaria.

"The excessive prevalence of Malaria as a whole can be attributed to the great facilities afforded to the breeding of mosquitoes, by the perseverance in and around the villages of dirty tanks, ditches, marshes and canal water in every direction, and to the *Bils* and dead rivers acting in the same way in some cases. In its turn, the presence of so much water is due to the want of natural drainage in the country, owing to its position in a deltaic tract, where the process of land-building is still going on. The rivers are gradually heightening their banks and beds, until the drainage is away from instead of towards them. The sub-soil water is unable to drain away rapidly, remains long at a high level after the wet season, and prevents the soaking in of rain-water resulting in casual collection of water remaining for long periods in every hollow, natural and artificial. It is the combination of these two factors, the high sub-soil water and the jungles and insanitary condition of the villages, that results in so high a Malaria rate. The pits, hollows and jungles in villages would in themselves be insufficient to account for so great a prevalence of the disease, were they not combined with lack of natural drainage, which allows the surface collection of water to remain for so long a time."†

The means advocated now, draining and filling up the cess-pools which are the haunts of Anopheles, are like treating symptoms of the disease, the root cause of which is not being tackled. Some of the experts say that the time of the beginning of E. I. Railway lines synchronizes with the beginning of the epidemic breaking out in an explosive form, that railway lines and high roads have obstructed drains and unless there are remedies for that it is wasting money and energy in solving the question of Malaria. These experts also say that the mighty rivers of the Gangetic system are gradually getting silted

* Deshbandhu Chitta Ranjan Das's Presidential Address at the Bengal Provincial Conference in 1917.

† *Vide* Drainage Committee Report of 1909.

Digitized by Arya Samaj Foundation Chennai and eGangotri

up and a large number of them have become already silted up, and that these are contributory causes of Malaria. Unless these are put in order, no amount of effort spent on village improvement will do any good. There is not the least doubt that a good amount of harm has been done by obstacle to drainage by high embankment and also due to shallow borrow-pits excavated all along the railway lines. In most cases, it is due to the ignorance and negligence of the railway engineers of the elementary laws of sanitation. Again there is not the slightest doubt that the deterioration of the river system is a predominant factor in producing Malaria.

There is a considerable amount of evidence to support the view that railway construction has been largely responsible for the disastrous change that has come over many parts of the delta in the last seventy years. Before the advent of railways, there were few roads and although river embankments existed in certain districts they were rarely efficient in preventing inundation, because breaches were common and more often than not the embankments were deliberately cut to let river water into the *bils* and on to the fields. As there were few roads to impede the free passage of the floods across the surface of the country, the water flowed from field to field, choosing the natural lines of drainage, and eventually made its escape through the network of *khals* and channels that existed in every part of the delta. But this natural process of flood and flush was destroyed by the advent of railways, which required embankments for their tracks and a system of feeder roads to convey passengers and produce to their stations. For, the periodic inundation of the country naturally tended on occasions to destroy the continuity of the road and railway communications and it became necessary therefore to make the river embankments secure against breaches; and in consequence flood water was shut out from the country, the natural system of deltaic irrigation was interrupted, drainage was impeded and the natural network of channels which used formally to be fed by the spill water from the great rivers became silted up and in many cases entirely destroyed, rendering boat traffic difficult and in many cases impossible. The embanking of the coun and the shutting out of river water from surface of the delta was further marked the simultaneous occurrence of appalli epidemics of Malaria, a serious decline agriculture and the progressive depopulati of the affected areas. There are grounds believing that the multiplication of roads railways has been a cause of land actu going out of cultivation. The effect embankments upon the fertility of cultiva land has to be considered in this connecti and a passage quoted below from the Ben Census Report of 1911 has special bearing this question :

> "There is no doubt that in areas liable inundation the embankment does frequently the drainage of the country. On the one floods are deeper and last longer than before, the soil becomes water-logged; on the other, land does not receive the same amount of moist or the same fertilizing deposit of silt."*

In the deltaic portions of Bengal, cultiva land, ordinarily subject to inundation river water, never requires to lie fallow whe as other lands do. Fallows, therefore, may taken as an index of soil impoverishment. proportion to the cultivated area, fallow la is five times as common in both Western Northern Bengal than in Eastern Bengal, in Central Bengal the proportion of fal land is just ten times as great as that Eastern Bengal.† From a comparison railways, roads and fallow lands in the ab four parts of Bengal, it is clear that multiplication of railways and roads in deltaic portions of Bengal is to be regard with grave misgivings. The embankme exert a most baneful effect upon the ferti of the soil, thus causing a serious decline the agricultural production of the areas serve. Roads and railways afford, no do excellent facilities for the transport of go and the rapid transit of passengers. But the construction of necessary embankm brings about in course of time enorm reduction in the agricultural outturns of w districts, and turns healthy areas into hotb of Malaria and eventually leads perhaps

* C. A. Bentley, *Malaria and Agriculture in Bengal*, page 33.

† A comparative statement is given in Ben work, page, 34.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the destruction of a large percentage of their total population, then the advantages must necessarily be said to be most dearly purchased. Says C. A. Bentley:

"Recent observations have shown on numerous occasions that, following the construction of embankments, there is a very great local extension of Malaria on both sides of the embankment, accompanied by a rise in the local mortality, an increase in the proportion of fever cases and fever deaths and a rise in the spleen index. Changes of this kind have been noted and specially reported on in detail in the case of the railways from Katwa to Sahibganj, in Birbhum and Murshidabad, in the case of embankments connected with the Sara bridge and in the case of the Sara-Serajganj Railway. A considerable rise in the fever-index has also been noted in the case of railway construction in Mymensingh."

Prior to the shutting of the Damodar floods, the condition of the affected area in Bengal was one of almost unexampled prosperity. In 1760, Burdwan which then covered an area of 5,174 square miles and included the present districts of Hooghly and Howrah, was described by the officers of the East India Company as the most productive districts within the whole province or Subah of Bengal. It was also spoken of as "a garden in the midst of a wilderness." But within a century and a half the population in Burdwan and Hooghly has fallen, according to Lt. Col. Crawford, by about 50 per cent, and the decline still continues, not only in these areas but also in many other parts of Bengal that have been similarly affected, and the Census of 1911 revealed the fact that during the previous decade depopulation had taken place in many *thanas* in different districts. The decline of population is most extensive in Western and Central Bengal, where there are most embankments and where agriculture has suffered the greatest deterioration. In almost every case also the decline of population is associated with the extensive prevalence of Malaria. It is significant that the decline is the least in Eastern Bengal, which is not so well provided with embanked roads and railways and where the country has not been protected from inundation by marginal river embankments. Where in a few areas depopulation is occurring in Eastern Bengal it is associated with the embanking of the country, a local decline in agriculture and a coincident increase in Malaria.

This decline in agriculture and increase in Malaria can be checked, according to Sir William Wilcocks, by the restoration of the ancient system of overflow irrigation of Bengal and also, according to Dr. C. A. Bentley, by canal irrigation along the embankment lines of the railway. How this old system of irrigation came to be neglected in Bengal has been described at length by Sir William Wilcocks and this description bears repetition here. By 1815 the zamindars and tenants of Central Bengal had neglected the clearing of the canals and the repairing of the banks with the silt so cleared, a work known as "Pulbandi." This negligence began in Bengal in the troublous Mahratta-Afghan wars, and the early English who were traders and sailors knew nothing about irrigation. Seeing many waterways neglected and unused after the wars, they thought the canals were meant only for navigation and they left them alone. This negligence made Central Bengal in 1815 cede the place of honour it held in 1660 to Burdwan whose river, the Damodar, was much better placed for irrigation than the Ganges. Decay had begun in Central Bengal, and it began later in Burdwan where the canal clearances were neglected on the canals which took off from the river, and there remained nothing but filling up of the breaches made in the banks of the Damodar itself. As the uncleaned canals took less and less water, more water remained in the Damodar and it became a menace to the country. The Damodar banks now assumed a fresh importance. These banks were known as "Zemindari banks." They were breached by the peasantry when the fear of an inundation had passed or a breach had occurred elsewhere; and in this way the old canals, now called definitely "dead rivers," were filled with water and the country irrigated more or less perfectly. Then it was imagined by everybody that these "Zamindari banks" were only flood protective works, and that they were kept up solely for that purpose. The "Zamindari bank irrigation" which was practised when the breaches or "Kanwas" were made and the canals or "Kanas" were filled with water, was considered as non-existent. The "overflow canals" were called "dead rivers" in places and "drainage lines" in others, but the word "irrigation" was never mentioned. Irrigation still went on, however,

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

because the zamindars and tenants made secret breaches in the banks and irrigated their lands when they could. These breaches were considered by the authorities as breaches made by the uncontrolled floods of the rivers and the Government set itself to put an end to such discreditable occurrings. It never seems to have struck anybody that the breaches were made secretly by the peasantry for irrigation. And yet it ought to have been evident that 40 or 50 breaches in a heavily embanked river of inconsiderble length in a single year could not possibly have been made by the river itself.*

The meteorological conditions in Bengal render irrigation necessary. The chief characteristics of the rainfall here are its unequal distribution throughout the seasons and its liability to failure or serious deficiency. This province, indeed, presents a greater variety of meteorological conditions than any area of similar size in the world. The second important characteristic of the rainfall is its unequal distribution throughout the seasons. By far the greater portion of the rain falls between June and September. During the winter months the rainfall is comparatively small, while the hot weather is practically rainless. Consequently it happens that in one season of the year the greater part of Bengal is deluged with rain and is the scene of the most wonderful and rapid growth of vegetation; in another period the same tract becomes a dreary sunburnt waste. Hence sometimes in the year, cultivation without irrigation becomes practically impossible and agriculture consequently ceases to depend upon the rainfall and relies wholly upon water obtained from other sources; again sometimes without proper aqueducts agriculture becomes impossible in the same tracts which are flooded with water and become the breeding places of mosquitoes and other worms. Therefore, something needs be done by the construction of reservoirs, to conserve the monsoon rainfall and extend its benefits over the other seasons of the year.†

An adequate supply of soil water for the plant is the first condition of success in crop production. Without this the plant cannot make full use of the natural fertility of the land. Hence is the dependence of the crop of India on the monsoon and the importance of a well-distributed rainfall to the country. The monsoon is the dominant factor in rural India. The well-known uncertainty of the monsoon produces other effects besides limiting the annual harvest. The character and outlook of the population have been affected. The people feel that the monsoon is in command. The villager is convinced that he has to accept what Providence has seen fit to provide. Hence comes the well-marked fatalism of the people, the general stagnation of village life and the absence of any desire on the part of the cultivator to improve his condition. The Bengal monsoon has produced two other results besides influencing the outlook of the people and often reducing the supply of moisture for the crops. In the first place, the heavy falls of rain, which often occur, lead to constant erosion and to the loss of the most fertile portion of the soil. In the second place, the duration of the monsoon is so short that only rapidly-maturing varieties of low potential yield can be cultivated. The annual loss of soil which takes place in India by erosion is immense and is an important factor in reducing the annual harvest. Except in the rice-areas soil-erosion takes place all over the country. In these tracts, the scientific control of surface drainage does not yet exist. Much of the rain is received in heavy fall; a large portion of the water runs off the surface towards the drainage lines, carrying with it the most valuable portion of the soil—the fine particles and a large part of the organic matter. Sometimes this drainage from the higher land leads to the water-logging of low areas before it reaches the rivers. In other cases the surplus water runs to waste so rapidly that there is no time for it to soak into the soil. The crops then suffer and the reserve of water in the sub-soil is not replenished. All these adverse factors—soil-erosion, water-logging and a shortage of soil moisture—occur because there is no control of the rain after it reaches the ground. Examples of the evil consequences which result from the want of control of the surface drainage are unfortunately only too abundant

Thousands of acres of valuable land have been destroyed by the formation of a network of ravines which produce little more than a crop of grass in the rains. These gullies have been carved out of the soft alluvial soil by the uncontrolled drainage in the past. Every year they extend further and further from the river, until they measure many hundreds of yards in length. Villages, which at one time were surrounded by fertile fields, now lie in a network of useless ravines. The real remedy for such damage is prevention by irrigation—the control of the drainage in the first instance. In matters like this, little can be hoped from individual cultivators, as they are too intent on their small areas of land besides being so poor and so ignorant that they cannot execute a drainage scheme for the country-side.*

Hence all efforts to effect agricultural improvements will be fruitless if facilities for irrigating the land are not forthcoming. In the old rural economy of Bengal, there was a carefully planned system of regulating the rain-water so as to lead the water from lands on a higher level to a lower level, but owing to the construction of railway and road embankments and the neglect of the water channels, these have disappeared in many cases, with the result that water-logging takes place in some parts, while soil-erosion occurs in others. During the monsoon season the rainfall in the Gangetic Valley is fairly heavy and this water, if it is not properly controlled, has a tendency to run off the surface without percolating into the soil after washing away the most valuable part of the soil. The result is loss of moisture in the soil and gradual permanent loss of fertility. The left bank of Jumna has lost thousands of acres of fertile land owing to the formation of ravines as the result of erosion.

"These ravines," says Howard, "have been carved out of the soft alluvial soil by the uncontrolled drainage in the past."† Every year the damage is greater and greater and unless some remedy by irrigation is at once effected, most villages in Bengal will more and more lose their fertile fields and will be surrounded by useless ravines in the near future.

Water control must be carried on with a view to economizing the volume of water supplied to different crops according to their necessity. Dry crops like wheat, cotton and maize do not require much water, while rice and jute are in need of a large volume of water for quick growth. There are some varieties of rice which require a larger amount of water than others. The wants of these different crops and their varieties will have to be studied and water is to be regulated accordingly.

Irrigation will increase soil fertility by silt deposit and improved drainage, thus encouraging cultivation of the land, increasing the food supply of the people, and promoting the prosperity of the country as a whole. Under the system of land tenure common to the greater portion of Bengal, whereby most of the land is held by small tenant cultivators, irrigation will tend to check decline of population and will increase especially the prosperity of the agricultural classes, who form the bulk of the rural population. In the conditions peculiar to deltaic areas and which exist in the greater part of Bengal, irrigation and the wet cultivation, including the cultivation of rice, promise to reduce the number of Anopheles mosquitoes and thus lessen the prevalence of Malaria.* In other words, as Dr. Bentley says, "Irrigation must be the watchword of Bengal."

The ancient kings and peoples of Bengal knew the advantages of irrigation and constructed a system of irrigation the distinguishing feature of which was that: (*i*) The canals were broad and shallow carrying the crest waters of the river floods, rich in fine clay and free from coarse sand; (*ii*) the canals were long and continuous and fairly parallel to each other, and at the right distance from each other for purpose of irrigation; (*iii*) the irrigation was performed by cuts in the banks of the canals, which were closed when the flood was over, these artificial cuts are today called "Kanwas" in Bhagalpur. The irrigation of Bengal was done principally by rainfall and the river water was used to manure the

rainfall and kill the mosquitoes or deprive them of their malignity.*

While trying to tackle the irrigation problem of Bengal one has to admit that no general survey of the irrigation possibilities of Bengal has yet been made. The Linlithgow Commission rightly pointed out that "the problems that await solution in Bengal, if, indeed, all the problems presented can be completely solved, are thus complex in the extreme." The complexity of the irrigation problem in Bengal has been admitted on all hands. First, there is the question of rainfall and conservation and regulation of both surface and sub-soil water; next is that of the effect of embankments on irrigation, drainage, sanitation and public health; then that of the condition and behaviour of deltaic rivers; then follows that of navigation.

The necessity for irrigation in Bengal is self-evident. The manifold advantages of irrigation can very well be summarized by concluding that irrigation means better economic conditions; means small farms with greater productive power, and ensures homes with greater comfort and health for men of moderate means. It means more intelligence and knowledge applied to farming,—more profit from crops, more commerce—because special products of higher grade and better market value will be enhanced. Irrigation will finally solve the great labour question and fortify against the alarming increase of city populations.

ABOLITION OF THE "SUTTEE"

An Unknown Tract of Rammohun Roy

The tract reproduced below was written by Raja Rammohun Roy and published by him in England in 1832. It has not so far been found in any edition of his collected works. It was discovered by Prof. U. N. Ball of Lahore in the library of the Forman Christian College, Lahore. The story as to how it came there has been told in the January number of this Review (p. 110), where the inscription on its cover in Rammohun's handwriting presenting it to Lady Johnstone was reproduced.

This unknown tract on the "Suttee" will be included in the Collected Works of Rammohun Roy shortly to be published by the Bangiya Sahitya Parishat. The Editor of the "Modern Review" will act as General Editor to the Parishat Edition of the Raja's Works.—Ed. *M. R.*

SOME REMARKS
In Vindication of the Resolution passed by
The Government of Bengal
In 1829
Abolishing The
Practice of Female Sacrifices
In India

—

Remarks, etc, etc.

THE practice of burning Hindoo widows, on the funeral piles of their husbands, was abolished by the Government of Bengal, on the 4th of December, 1829, in consequence of which these unfortunate and deluded persons have been completely saved from destruction, for a period of two years and upwards. Certain Hindoo inhabitants of Calcutta, who find this humane measure detrimental to their own interests, have under the advice of an attorney of the Supreme Court, at the Presidency of Fort William, thought proper to bring the subject before the Privy Council, with the view of having the Regulation rescinded and the practice renewed.

2. Par. As to the propriety, or justice, or humanity of re-establishing such a cruel usage, it may safely be left to the wisdom and discretion of exalted individuals, before whom this Christian country and enlightened age, the subject is to be discussed.

3. Par. With regard to the question of policy, which to many statesmen seems paramount to justice, humanity, conscience, law and religion, it might have been alleged that the abolition would be an interference with the religious rites of the Hindoos, and would cause insurrection, perhaps revolution in the country, and terminate in the loss of the British possessions in India. On this point I beg to offer a few remarks.

First. If there had been any chance of popular commotion being excited by such an abolition, it might have been expected immediately after the measure was adopted in the latter part of the year 1829. About two years and upwards

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

however passed, and no accounts have been received that any widow has been burnt, in opposition to the regulations of Government, or even that any attempt at commotion has ever been made.

Secondly. From a reference to the printed official returns, (laid before Parliament) of the number of Suttees within the territories of the Presidency of Fort William, from 1815 to 1828, inclusive, it appears that within the province of Bengal, including the city of Benares (to which place an immense number of the Bengalees, male and female, retire, from religious prejudices, to end their days,) and Patna, which is adjacent, and has been long united to Bengal, by political connection as well as by close and constant intercourse, the number of female sacrifices has mounted to 7941, whereas in the whole extent of the upper provinces, classed under the head of Bareilly, we find only 203 in a period of 14 years, (on an average about 14 in each year): consequently had there been any chance of popular commotion, it might have been dreaded in Bengal particularly, where the practice chiefly prevailed. But it is well known that from education and want of physical energy, the natives of Bengal are the last persons in the world to be expected to rise against public authority.

Thirdly. Even in Bengal a greater number of the most intelligent and influential of the natives, landholders, bankers, merchants, and others, felt so much gratified with the removal of the odium, which the practice had attached to their character as a nation, that they find united in presenting an address of thanks and congratulation, on the subject, to the Governor General, Lord William Bentinck, on the 18th of January, 1830,* and in like manner, when his Lordship, in his progress to the upper provinces, arrived at Buxuar, (situated between Patna, and Benares,) persons of the highest rank and respectability, supported by numerous inhabitants, presented another address, expressive of their satisfaction at the abolition of the horrible custom, as will appear by the *Calcutta Government Gazette* of November 15th, 1830.

Fourthly. It was not religious devotion alone which prompted the generality of the natives of Bengal, who carried on the practice of widow burning to such an extent; nor is that their motive for wishing its re-establishment. But it is their wordly interest, which many wish to serve under the cloak of religion. Since according to their law of inheritance (the *Dayabhaga*) a widow is entitled to inherit the property of her deceased husband, without regard to his condition in life, and therefore is a complete bar to the claims of the father, mother, brothers, sisters and daughters of the deceased, who have all consequently a direct interest in the destruction of the widow. But in the upper provinces where the *Mitakshara* is respected as the law of inheritance, according to which the rights of the surviving wife are more circumscribed, the relatives of the husband are not much interested in her death; and in these provinces it is found that the Suttees are comparatively very rare.*

Fifthly. Hence, it is obvious, that as the adherence of the Bengalees to this practice generally springs from selfish considerations of a wordly nature, the abolition of such a fertile source of intrigue and calculating cruelty cannot excite any apprehension of religious enthusiasm in those persons who are conscious of the unworthiness of the cause they advocate; even if the Bengalees had possessed physical energy, and a war-like education. These considerations (and many others might be added) are sufficient to shew, that policy by no means requires the re-establishment of the open perpetration of suicide and murder.

4 Par. It might be alleged, that the British Government has pledged itself not to interfere with the religious rights of its Indian native subjects; but, it must not be forgotten, that according to common sense, as well as from a reference to precedent and the dominion in India, it is clear, that this rule was always unequivocally meant to apply to religious observances which are considered incumbent on the people, according to the principles of their own faith, and which are not a nuisance and outrage to public feeling. On this principle, the Government, from time to time, prohibited various practices performed in the name of religion; such as the perambulation of the streets by Nagas, (or naked devotees), infanticide and suicide under the car of Jagganauth, the self-destruction and public burning of lepers, human sacrifices, etc. etc.; it being found that these practices were only partially observed and consequently merely optional, not incumbent, since their omission involved no less of civil rights, nor did it bring reproach on those who failed to observe them; while their ohservance was highly offensive, a nuisance to the public, and a reproach to a civilized government. The case is precisely the same with respect to widow burning. For, first, in regard to the

* *Vide* the *Bengal Hurkaru*, or the *India Gazette* of the 18th of Jan. 1830. "The whole wealth of a deceased husband, who has no male issue," shall belong to his widow, though there be brothers of the whole blood, "paternal uncles, (daughters) daughter's sons, and other heirs." Celebrook's translation of the *Dayabhag*. Chap. 11. sec. 1. Art 3rd.

* A wife being chaste takes the whole estate of a man who being separated from his co-heirs and not subsequently reunited with them, dies leaving no male-issue. Colebrook's translation of the *Mitakshara*. Chap. 2. Sec. 1. Art 39. It should not be overlooked that amongst the Hindoos, brothers very generally, or almost always, live in joint families, and very often first and second cousins also; consequently the qualification of non-separation has almost annihilated the rights of the widow.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

number of widows burning in the province of Bengal, only one widow out of perhaps thirty, and in the upper provinces, one out of nine hundred and ninety-nine could be prevailed on to perform this horrid sacrifice; while all the rest lived in the enjoyment of their civil rights and social respect (as shewn by thousands of judicial decrees): and again, on the score of nuisance, it is a source of greater offence and disgust to the public than the rest, from its being performed of human beings expiring under the greatest sufferings. Therefore, a regard to consistency and its own character compelled the government to deal with this practice as they had done with the others before mentioned.

5 Par. In addition to its local observation of the option exercised by widows, of either living an austere life, or of burning themselves with the corpse of the husband, Government was furnished with the verdicts of the Pandits of the Sudder Dewanee Adawlut, and of the Supreme Court of Calcutta; who, notwithstanding their enthusiastic zeal in favour of the practice of concremation, felt compelled by the force of truth to acknowledge, that at most it was entirely optional; nay, that an austere life was more meritorious.

First. In reply to the question submitted to the Hindoo Law Officers of the Sudder Dewanee Adawlut, in March 1817, it was stated (p. 174), that "the woman who wishes to accompany her deceased husband, let her ascend the funeral pile." In some cases, the widow may be laid on the funeral pile, before it is lighted, by the side of her husband. But, (p. 175) if she be then destitute of the wish to perform the act of *sahagaman* (concremation) she must be lifted off." Again (page 175), "If having arrived at the place of burning, she determine to burn, the ceremony of depositing the widow must be again gone through." "If she afterwards express a wish to rise, she must be lifted off."

Second. The Pandit of the Supreme Court (Mrityoonjay) states, (p. 178) that according to the *Jutta Mala Bilas* "ascending the funeral pile is a voluntary act, and not an indispensable one" (p. 182). The alternative of leading an austere life being mentioned and "any objection adverse to it, being removed by the comparison cited in the text, this alternative seems evidently to be recommended by the favoured side of the argument" (p. 182). "In a person who is careless about absorption and desirous to obtain a paradise of temporary and inconsiderable bliss the act of "anoogaman (following the husband) is justifiable, but from this "reasoning it appears evident that the leading of a virtuous life is preferred as the superior alternative, and that the act of 'anoogaman' is held to be of inferior merit." (p. 182). No difference prevails with regard to the propriety of leading a life of "austerity" (p. 183). "Not the slightest offence attaches either to "the women who depart from their resolution (of burning) or to those who persuade them to relinquish their intentions" (p. 183).

6. Par. If we look further into the consequences arising from the successful exertions of European Orientalists, in translating Sanscrit works, in various branches of literature, into the English language, of the Brahmans, in the interpretation of the Hindoo law, and Religious doctrines. For example, the translation of the institutes of Menu, by Sir William Jones, which is before the public, and which work, is a system of duties, religious and civil, and of law, in all "its branches, which the Hindoos firmly believe to have been promulgated in the beginning of time by Menu the son or grandson of the older only, but the holiest of legislators, a system so comprehensive and so minutely exact, that it may be considered as the institutes of Hindoo law." (Sir W. Jones's works, Vol. VII, p. 7, Preface.)

7. Par. This great legislator, in prescribing the duties of widows, thus ordains: "Let her (the widow) CONTINUE TILL "DEATH, forgiving all injuries, performing harsh duties, avoiding every sensual pleasure, and cheerfully practising the incomparable rules of virtue, which have been followed by such women, as were devoted to one only husband." (Chap. V, Verse 158, p. 7). "And like those abstemious men, if after the decease of her lord, she devote herself to pious austerity (Ver. 160.) But a widow "who from a wish to bear children, slights her deceased husband, by marrying again, brings disgrace upon herself here below, and shall be excluded from the seat of her lord." (Ver. 161).

8. Par. Here Menu by the expression "let her continue till death," imperatively commands all widows to live a life of virtue, piety and austerity, discountenances her marrying again, and does not admit the idea of any such alternative as that of burning with the corpse of the husband.

9. Par. It cannot be alleged that the Veds have justified the practice and superseded the authority of Menu; since the Ved itself declares that "whatever Menu pronounced, was a medicine for the soul." (*Vide* Sir W. Jones's works, Vol. VII, p. 83, lines 21 and 23.)

10. Par. Nor can it be alleged, that Usanas and some other legislators who recommend widow burning, and also profess to found their doctrines on the Veds, should be considered of equal authority to Menu; since on the Ved itself, the text above quoted, the authority of which we acknowledge to be supreme, sanctions only the precept of Menu, and in addition to this Vrihaspati declares, that "Menu held the first rank amongst legislators; because he has expressed in his code the whole sense of the Veda; that no code was approved which contradicted Menu." (Sir W. Jones's Vol. VII, p. 83, line 25.)

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

11 Par. Therefore any quotation from other authorities or detached passages attributed to Menu, but not to be found in his code, and inconsistent with it, cannot be considered as of any validity. Then, whence, it may be asked arose a practice so repugnant to reason, and so contrary to the most ancient, and highest legislative authority of the Hindoo? Only (I reply) from the jealousy of their Princes, who were unable to tolerate the idea of their wives proving forgetful of them, and associating with other men after their deaths, and their dependants were induced to follow their footsteps, actuated by the same motives, and also by the influence of example; while their surviving relations did not fail to encourage the practice, for the reasons above explained, to promote their own interests, and literary men of similar feelings have not been wanting, to support their views, by interpolations and inventions, under the name of traditions, and quotations, from the Poorans and Tantras, which all acknowledge to have no limit, or certain standard. But unfortunately it is an established rule, that every doctrine founded on these, is to be rejected, when on a fair critical examination, it proves to be inconsistent with Menu, the only safe rule to guard against endless corruptions, absurdities, and human caprices.

R. M. R.

FINIS

Nichols and Sons, Printers, Earl's Court, Cranbourn Street, Leicester Square.

APPENDIX

—

It cannot, I think, be irrelevant to the subject, to bring under the notice of the British public, that the abolition of the practice of burning Hindoo Widows alive, on the funeral pile of their deceased husbands, was a measure not indiscreetly or rashly adopted by the Governor General of Bengal, but it was recommended and officially suggested to Lord William Bentinck, by the members of the Supreme Council—by the judges of the Sudder Dewany, and Nizamut Adawlut, who are most deservedly entrusted with the power of life and death, over the millions of the Natives of India,—by the officers of Government, holding responsible situations, and possessed of the best local information,—as well as by the long-resident Europeans of the first intelligence and unquestionable respectability; with the exception of six individuals out of the whole British public living in India.

AUTHORITIES FOR THE ABOLITION

1. Members of the Supreme Council
   1. Lord Combermere, Commander-in-Chief
   2. The Hon. W. B. Bayley.
   3. Sir Charles Metcalfe.
2. Judges of Nizamut Adawlut, or Supreme Criminal Court
   W. Leycester, Esq., Chief Judge
   A. Ross, Esq., Second Judge
   C. F. Sealy, Esq., Third Judge
   R. H. Rattray, Esq., Fifth Judge
3. Officers of Government holding responsible situations, Military, Judicial and Revenue, and long-resident Europeans of high respectability.

1st. Those of persons in favour of an immediate and total suppression of the Rite by the authority of Government.

1. Lieut.-Colonel Richard Audree
2. Major W. S. Beatson
3. Colonel R. H. Cunliffe
4. Major R. L. Dickson
5. Lieut.-Colonel J. Doveton
6. Brig. General F. Duncan
7. Lieut.-Colonel W. Dunlop
8. Lieut.-Colonel C. Fagan
9. Lieut.-Colonel W. C. Faithful
10. Lieut.-Colonel J. Kenedy
11. W. H. Macnaghten, Esq
12. Lieut.-General G. Martindell
13. Captain J. B. Neufville
14. Lieut.-Colonel C. Povolen
15. Brig. General W. Richards
16. Captain S. Riley
17. Captain D. Ruddell
18. Major General Shuldham
19. Lieut.-Colonel E. Simons
20. Lieut.-Colonel H. T. Tapp
21. Captain C. Thoresby
22. Lieut.-Colonel L. H. Todd
23. Major F. Walker
24. Captain G. Young
25. J. Young, Esq.

2nd. Recommending the immediate suppression of the Rite by the authorized interference of the local Magistrates.

J. Dunsmure, Esq.

3rd. Persons who recommend a total and immediate prohibition of the Rite by Legislative enactments, as expedient, safe, and practicable.

1. W. W. Birs, Esq.
2. R. M. Bird, Esq.
3. G. F. Brown, Esq.
4. James Calder, Esq.
5. W. Ewer, Esq.
6. Robert North Collie Hamilton, Esq.
7. A. Stirling, Esq.
8. A. Trotter, Esq.

4th. Persons who recommend a gradual abolition of the Rite by the authorized interference of the Magistrates.

1. Major H. Hall
2. Major A. Hardy
3. Lieut.-Colonel W. H. Kemm
4. Major L. Land
5. Lieut.-Colonel J. H. Litter
6. Brig. General James Price
7. Lieut.-Colonel J. Skinner
8. Lieut.-Colonel B. Rope
9. Lieut.-Colonel E. F. Waters

THE ORIENTAL STUDENTS' CONGRESS AND THE THIRD CONVENTION OF THE INDIAN STUDENTS IN EUROPE, ROME, 1933

By AMIYANATH SARKAR

On the occasion of the inauguration of the Italian Institute for the Middle and the Far East, which owes its existence to the indefatigable efforts of Prof. Tucci, Senator Gentile, Consul Scarpa and Baron Ricciardi,—a Congress of the Oriental Students in Europe was invited at Rome during the last Christmas Week. Students from the different university towns of Europe representing Japan, China, Siam, India, Afghanistan, Persia, Arabia (including Palestine, Syria, Leffanon) attended the Congress and their number was six hundred in all, the Chinese alone were 150 in number including many girls. The number of Indian delegates were 86 and they came specially to attend the Third Convention of the Federation of Indian Students in Europe. More than 30 Indian Christian students attended the Congress from the Pope's Propaganda College.

For the first time a Congress of this nature was organized and much credit is due to the Italian Students Association and the Hindusthan Association of Italy who jointly took the initiative in organizing the Congress. The Italian authorities granted second class return railway tickets to the delegates within the Italian frontiers and the delegates were the guests of the Italian Stude Association of Rome.

The authorities were lavish in their hospita towards the delegates. In successive days were received by the Oriental Institute, Rector of the University, University Fe Group, His Holiness the Pope and some in duals. Moreover, visits to important pla exhibition, and opera had also been arran To crown everything, Signor Mussolini him came down to address the Oriental students the opening day of the Congress which held in the historic Julius Caesar Hall on Capitoline Hill.

Though unfortunately there was no men in his speech about India and China, and attention was given to the Mediterranean A a few lines quoted from Mussolini's remarks speech might help us to follow the trend of whole speech as well as to understand Ita attitude towards the East. Mussolini in co of his speech said that he considered the saying

"East is East and West is West
And never the twain shall meet."

Mussolini addressing the opening meeting of the Congress of the Oriental Students in the Julius Caesar Hall on the Capitoline Hill. Rome, December, 1933.

to be historically "nonsense." He continued :

"Twenty centuries ago Rome achieved a union in the Mediterranean between East and West which has been of tremendous importance in the world's history. Rome colonized the West, but in the East—in Egypt, in Syria and in Persia, the relationship was one of mutual creative understanding. This union was the corner-stone of our entire history and it gave rise to European civilization. This must now become universal once more or else perish."

* * * *

" . . . the new currents of traffic, the increasing flow of gold, and the exploitation of rich and distant countries gave rise to capitalism as the basis of a new civilization of a materialistic and exclusive character, with its seats far from the Mediterranean.

It was then that all intercourse between East and West came to be placed exclusively on a footing of mere subordination and was restricted to a purely material sphere. Every spiritual link tending to a creative collaboration came to cease and the belief became widespread that Europe and Asia must be antagonists. And the cause of all this was merely a type of mentality existing in some parts of Europe which was incapable or unwilling to understand Asia, which considered Asia as a market for produce and as a fountain-head for raw materials."

At the close of Mussolini's speech t President of the Congress spoke thanking Duce and heartily reciprocated the sympa for Asia expressed by him. He was follo by an Arab, M. El. Djabri, the Vice-Presid of the Congress, and then Sreemati Bha Sarabhai spoke on behalf of the Indian delega

The Congress had a successful session it formed its Executive Committee with delegates from each nation and Mr. K Jehanghiani, an Indian, was appointed J Secretary to the Congress. Before disper the Congress resolved to start a perman bureau in Rome for continuing the us work done by the Congress for one ye An Indian student, Amiyanath Sark and a Chinese girl student, Mlle. Suzanne L were appointed Joint Secretaries to the Bur of the Federation of Oriental Students. T Bureau has already started to function.

Simultaneously with the Oriental Stud Congress was held the third Convention of Federation of Indian Students in Europe. Sr Subhas Chandra Bose, who was invited to inauguration of the Oriental Institute, unanimously elected President of the Conventi Sj. Bose's presence in Rome not only contribu

Sitting from Left to Right: Messrs. Jaikumar Atal (Vice-President, Oxford), Gairola (Treasurer, Vienna), Khanna (President, Munich), Sj. Subhas Ch. Bose (President of the Conference), Dr. Katyar (Secretary, Vienna), Ali (Member, London).

Standing Left to Right: Amiya N. Sarkar (Convenor & Secretary to the Convention), Asoke Bose (Member, Munich), Pardhy (Member, Birmingham), Mathur (Member, Vienna), Kamdar (Member, Dramsdatt), Sing, P. N. Roy (Member, Rome), D. N. Das (Rome).

very largely to the success of the Indian Students' Convention but it also had a benign influence on the work of the Oriental Students' Congress at moments of disagreement amongst the delegates of the different nations.

The Convention was inaugurated by H. E. Prof. Destefani, President of the Faculty of Political Science of the Rome University and Member of the Fascist Grand Council, who welcomed the delegates in very cordial terms. The meeting was also addressed by the Secretary of the University Fascist Group. Many useful resolutions, including one admiring the Congress for its work and another condoling the deaths of Sj. Sen-Gupta and Patel, were discussed and adopted. Mahatma Gandhi was elected the Honorary Life President and Sreejuts Jawaharlal Nehru and Subhas Bose were elected the Honorary Vice-Presidents of the Federation.

It was decided to reorganize the central office of the Federation for this purpose and it was decided to hold the next Convention in Vienna. It was also shifted from London to Vienna.

In course of his presidential address in which Sj. Bose dealt at a great length with the various problems of Indian students and suggested some solutions requesting the Indian students to come to continental universities and industrial centres instead of crowding in particular countries. The continental universities are as good as those of any other country and they are producing remarkable men. He also said in connection with the student movement in India.

> "The Student Movement in India is intimately connected with the larger national movement in the country. I have seen the same manifestation in Germany and in Italy. Nevertheless, the task of the Indian students is much harder than the task of students in other free countries, because our students do not get the support of their Government—I mean, of the Government of India."

At the close of the Convention the delegates to the Indian Students' Convention were entertained at a tea party by the Hindusthan Association of Italy and the function was attended by many Italian personalities. During tea, a debate was held under the presidency of Sj. Bose on the subject "What Indian students have learnt in Europe." The function was highly enjoyable and Sj. Bose wound up the debate with a nice little

speech. Thereafter the newly formed Council of the Federation met and laid down the programme of work for the coming year.

It is very much hoped that this Congress of Rome will really bring together all the students of the East who by their mutual co-operation and *camaraderie* will advance the cause of the re-awakened East.

THE EXPORT DUTY ON JUTE BENGAL'S CLAIM TO IT

By ABANI MOHAN KUSARI, M. A.

THE Federal Finance Committee (1932) of the Indian Round Table Conference dismissed Bengal's claim to the export duty on jute in para 83 of its report which runs as follows:

> "Bengal has frequently put forward a claim to a share, in some form, of the proceeds from the taxation of the export of jute. Assam, too, has recently claimed the excise duty on kerosene and motor spirit produced within its borders. These or any similar proposals raise highly controversial questions of principle; but as, in any case, they could only result in delaying *pro tanto* the provincial contributions, we have not felt able to take them into account for the purposes of our scheme."

It is apparent that the Committee did not go into the question of the justice or otherwise of Bengal's claim to the duty but dismissed her claim on the ground that it would delay the remission of provincial contributions.

Apart from the question whether or not the system of provincial contributions proposed by the Committee is a reversion to the iniquitous Meston Award, the following considerations may be urged on behalf of Bengal. First, the remission of the contributions will take place after a long period of ten years following the introduction of a federal system of Government in our country. Secondly, the contribution on the part of Bengal proposed by the Committee will be much less than Bengal's contribution to the Central Government in the shape of the duty on jute. In 1928-29, out of the total jute-tax of nearly 422 lakhs of rupees, Bengal contributed about 399 lakhs, whereas the proposed contribution of which Bengal will be relieved is only 205 lakhs. Bengal will be thus clearly a loser if she acquiesces in the Percy Award. Thirdly, between 1916 and 1930 the export duty on jute contributed nearly 50 crores of rupees to the Central Exchequer which must have lightened the burden of taxation in all provinces. But since the Montagu-Chelmsford Reforms have been introduced Bengal has compared most unfavourably with the other provinces in regard to her deficits in budget, severity of retrenchments and unusual lowness of the scale of expenditure of public money per head of the population. (In 1931-32, the estimated expenditure per head was Rs. 2.3 in Bengal, Rs. 7.4 in Bombay, Rs. 7.5 in Burma, Rs. 5.1 in the Panjab and Rs. 3. 8 in Madras).*

It is necessary to point out that the assignment of the power of taxing jute to Bengal does not conflict with any essential principle of federalism. In the same vein is that of the Federal Finance Committee with a well-known Indian constitutionalist: "... the receipt from the export duty on jute ... credited to Bengal, Burma's claim to ... proceeds from the export duty on rice exported from it will be almost irresistible."† He also quotes Seligman in support of the ... that customs duties are almost everywhere kept for national or federal use. It is scarcely necessary to point out that Burma will comfortably enjoy the duty on rice as she is likely to remain outside the Indian Federation. But it is more significant to point out that the term 'customs duties' admits of various interpretations. Sir P. C. Mitter draws attention§ to p. 139 of Mr. Donald Kerr's book, *The Law of the Australian Constitution*

* Report of the Bengal Retrenchment Committee (1932), para. 7, page 4.

† D. N. Banerjee: The Indian Constitution and Appendix U, p. 616.

in which is to be found the following quotation from Prof. Moore's opinion on the subject: "'Duties of customs' mean duties imposed upon the importation of goods into the Commonwealth from parts beyond the Commonwealth." Export duties are expressly prohibited in the constitution of the U. S. A., sub-section 5 of section 9 of which runs as follows: "No tax or duty shall be laid on articles exported from any State." So in the case of the U. S. A. the question whether or not export duties should be assigned to the centre does not arise at all.

It must also be said in all fairness that the present assignment of the duty on jute involves discrimination against Bengal. It can be safely assumed that most of the duty on rice will go to Burma when she will be separated from India. The remaining two export duties, namely, those on hides and skins, and that on jute, amounted to Rs. 499.2 lakhs in 1929-30, to which the duty on jute contributed Rs. 463.67 or over 92 per cent. It is thus apparent that at least 90 per cent of the export duties will be collected from Bengal for the benefit of the whole of India, including the Native States, when a substantial part of this sum is, as will be argued in a moment, paid by the tax-payers of Bengal and not by the foreign buyers of jute. That it is the duty of a federation to avoid discrimination between its units may be judged from section 51 (II) of the Australian Constitution: "The Parliament shall, subject to the Constitution, have power to make laws for peace, order and good government of the Commonwealth with respect to . . . taxation, but so as not to discriminate between States or parts of States." It is true that a much too provincial outlook is a bane to the spirit of federalism. But jute being almost a monopoly of Bengal on the production of which the wealth and welfare of the majority of the Bengalees depend, to retain the present allocation of the duty on it would be sacrificing one unit at the altar of others; and this in a federal constitution has no meaning "except the meaning of exploitation."* It is undoubtedly true that the claim of Assam to the excise duty on kerosene and motor spirit is a strong one. But, as Mr. Ghuznavi has pointed out, the claim of Bengal cannot be nullified by pointing to other similar claims because mineral products, such as oil or petroleum, do not stand on a par with jute, which is the main staple crop of Bengal and with the fortunes of which is bound up the prosperity of millions of her peasantry.*

The argument that jute is a monopoly of Bengal and hence the duty on it is paid by the foreign purchasers of jute has been pul forward many times. Yet even the Fiscat Commission (1921-22) and the Taxation Inquiry Committee (1924-25) had to admit that "an absolute monopoly for which there is a stable demand is of rare occurrence and it may, therefore, be taken as the general rule that some portion, if not the whole, of an export duty falls on the home producer." Attempts to produce synthetic jute have not been very successful; but bulk-handling and the use of paper bags have diminished the demand for jute to an appreciable extent. Moreover, in the post-war days jute has not been a monopoly in the sense that its producers have been able to control its price. The total demand for gunny or hessian or loose jute has often been less than the amount manufactured or produced in Bengal, so that the foreign buyer has been able to dictate the price for them.† Even when the demand for jute has been large, the exporter or manufacturer of it has not raised its price by the full amount of the tax because it has been possible to buy jute very cheaply from the unorganized ryots who are ignorant of the conditions of trade. It is not difficult to see that Bengal has borne a heavy burden of taxation for the benefit of the centre.

That Bengal can claim the duty on jute, whether in the form of an export duty or a provincial excise, needs no further emphasis. The production of jute is, to a great extent, the cause of malaria in Bengal. But compared to other provinces the expenditure per head on medical relief is very low in Bengal. The Primary Education Act has not been given effect to for lack of Bengal's resources. Bengal

stands very low in the scale of expenditure per head on education in comparison with the other provinces.* She is threatened with a minimum budget deficit of Rs. 2 crores each year in the immediate future.† We have already seen that Bengal stands very low in the scale of expenditure of public money per head of the population. The relatively backward financial position of Bengal does not improve substantially under the Percy Award. The approximate figures of revenue per head under the Percy Award stand at 2.5, 7.3, 4 and 2.7 rupees for Bengal, Bombay, Madras and U. P. respectively. The White Paper promises to Bengal at least half of the duty on jute collected within her borders. But this minimum of 50 per cent will, it is feared, tend to become the maximum for a long time to come. If that is so, the revenue per head for Bengal will be only 2.9 rupees. It is only the whole of the duty on jute together with the distribution of the income-tax on a suitable basis§ that can make Bengal approach the level of income and expenditure of other provinces, if not reach it.

* Hartog Committee's Report (1929), *passim.*

† Report of the Federal Finance Committee, para. 11, p. 5.

§ The Percy scheme of distributing a part on population basis and the remainder on the basis of the amount of personal income-tax collected within the provinces gives Bengal a fair share.

JOHN DAVISON ROCKEFELLER

American Multimillionaire and Philanthropist

By P. GOPALA KRISNAYYA, M. A., M. SC.

To be not only the richest of nearly two billion living human beings, but the richest human being of all time, is quite as phenomenal as to be the Himalayas or the Great Canyon.

No one but his own book-keepers and advisers—probably no single one of them—knows how big the Rockefeller fortune is. Probably no one else but Rockefeller's son will ever know, because he has parted with great shares of his wealth to his children. No law compels him or them to confess the site of their fortunes to the rest of the world. His last will and testament will not solve the riddle because it will not specify fortunes transferred during his lifetime. The fortune is partly in lands and buildings, partly in shares of railroads, oil companies and other business, partly in tax-exempt bonds. However uncertain we are about the fortune of Rockefeller, we know he and his foundations have till now given over $1,000,000,000* in charities.

John Davison Rockefeller of formal reference and John D. of popular parlance, the world's champion fortune builder and champion money giver, was born in an humble cottage, near Harford Mills, a village in the State of New York on July 8, 1839. His father was a sort of quack doctor and a "resourceful, active, aggressive all round man of affairs." His mother was a very pious and capable woman. "The result of her training and discipline is seen in the achievements of her children." John was the second of five children who lived. William joined him in business. Two sisters became Mrs. Rudd and Mrs. Briggs. The younger brother Frank did not seem to have got on well with his famous brother.

His boyhood was better calculated to create a village store-keeper than the world's richest man and "one of America's four greatest men" according to Ludwig, the famous biographer. He was born and reared on a New York farm and did what most village boys still do, milked cows and picked potatoes for a dirt farmer. He had very little education, attended a district school about a stone's throw from his home spasmodically until he was sixteen years of age. He was a cautious boy. He was not quick at school—rather mediocre. One thing he was good at was mental arithmetic. He tells of an occasion in the 80's when his proficiency in the subject saved him several thousand dollars as he computed while engaging the seller in a running conversation on various subjects.

Rockefeller's boyhood gives few keys to later success, though it does help us to understand

* $1 is approximately equal to about Rs. 3-8-0

why there was so little joy in his fortune building. Born and reared in stern reality, he started with a nature that easily became fixed in secretiveness and self-restraint. Hills shut him physically. The life around him and loyalty to his father shut him in morally and physically. As the eldest son he had not only to "mind" but to help to train two younger brothers to mind. The instinct of self-preservation, as well as family discipline, made him as secretive of his father's business as he was ignorant of his father's whereabouts. Undoubtedly he felt his mother's sufferings and appreciated her necessities. Religion played a prominent part in his life. He was a conformist. He believed in what was taught. He practised what it preached. Rockefeller believed that you had to be either for a habit or against a habit, for or against a social practice, just as his Bible and his preacher said you were either for the Lord or against the Lord.

Though the tallest business ladder of all time up to his final retirement in 1911, Rockefeller's business ladder really had but seven rungs.

September 26, 1855, when as an youth of sixteen he became an errand boy and clerk in a retail and wholesale firm in Cleveland, Ohio.

In 1858, at nineteen he bought a half partnership in a produce business that combined retailing with buying and selling on commission for out of town sellers and buyers. An old advertisement says it dealt in 'grain, fish, water, lime, plaster, coarse fine solar and dairy salt."

In 1862 when twenty-three he branched into oil refining and marketing as an experiment but without burning his produce bridges behind him. Oil refining was but three years old. "Almost every one" was trying it. Rockefeller believed in taking the waves ankle first instead of head first.

In 1865 when twenty-five he went into oil for all he was worth and stayed there for the rest of his business life. To extend his businees he borrowed with new capital he took in his backer's representative, Henry M. Flager, and later the backer himself, S. V. Harkness. He concentrated on oil. No other business took his thought. Not until the late eighties did other enterprises take any of his money. He was not a speculator. He invested in various industrial enterprises as an outlet for a surplus income not needed to expand the oil business.

In 1870 when thirty-one he organized the Standard Oil Company of Ohio, combining several Cleveland partnerships, with himself as president and master mind. He was undisputed oil king within two years. When absorbing competitors he scrapped unnecessary plants, but retained and enriched brains and executive ability, making every leader rich who went with him.

In 1882 when forty-three he organized the Standard Oil Trust with nine trustees and himself as president and master mind. He was now world emperor of oil. For thirty years his oil trust was the dreadnought of the oil trade, the black devil of politics, the envy of predatory business, model for good and bad trusts, and stimulator-in-chief of punitive and remedial legislation. His trust was intangible, unlocatable, unarrestable, owned nothing, made nothing, sold nothing, told nothing and trusted almost nothing to paper. Yet for a generation it ruled the oil world, the railroad world and much of the banking world, political world and newspaper world.

It was a point of view, a gentleman's agreement, "many souls with but a single thought." It evaded and broke old common law and specially made statute law like the Sherman Anti-Trust Act, but so subtly that even a trust busting era almost failed to prove its illegality. The same men owned many oil companies—usually but not always called standard—each of which had its own officers. They centralized vision, finance, policy. They decentralized execution. The power was central, the blame was local, the profits went to all stockholders. "It accomplished by strategy what could not be accomplished by assault··· It did indirectly what it was prohibited from doing directly."

In 1894 when fifty-five and about to retire from active business he annexed a second huge fortune by extending his ownership of iron mines in Minnesota until his holdings became necessary to the success of the mammoth steel trust organized by J. P. Morgan in the twentieth century. In this master stroke Rockefeller did the final selling himself despite his alleged complete retirement.

In 1895 when fifty-six he tried letting his business ladder stand without his constant attention. He withdrew from active control of business affairs without, however, advertising the fact to the business world. He retained the presidency.

In 1911 when seventy-two after hearing the United States Supreme Court rule that he had been an unfair business builder for forty years he formally retired from even nominal contact with his business ladder.

Rockefeller's business ladder grew like Jack's bean stalk and carried him with it. There was no toilful climbing round by round up a ladder all pitched and spaced when he began his climb. He started as Henry Ford did a half century later on a business ladder which mankind's demand for a simple utility rapidly pushed to the skies. Rockefeller like Henry Ford kept his balance at the top of this ladder.

How he became oil king and the symbol of predatory business is a fascinating study. It is important here merely to record that his ladder was not made of silk and sprayed with the odour of rose leaves. On the contrary his road to riches and fame was thorny and malodorous. Few men in all history have weathered such storms and suffered such hatred as did Rockefeller while riding with his business ladder. From 1822 before

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

he was thirty-three until he was seventy-four in 1913, when the American Congress refused to charter his $ 100,000,000 foundation, he was dreaded and condemned more than probably any citizen in America. He was investigated, reinvestigated, investigated again, "dared" to "show his face" in the oil fields, treated with fear and respect when he did show his face, indicted for conspiracy and almost tried, but always "went along about his business" as his father had disciplined him to do. He did not defend himself. He did not carry the war into the Press. He kept still but kept right on making money and getting his fist around the world's oil trade. Those were sagaciously silent and widely opulent days.

What kind of man is Rockefeller? What is he like? What is his personality? Is he "taciturn and mysterious" as Emil Ludwig told the Press after a short visit in 1928 and after deciding to write a biography of Rockefeller. His deeds are a better personality sketch than any impressionist can paint or mould.

At ninety-four he is physically what you have seen filmed at the movies and photographed in newspapers. Many have been surprised that one who looks so old is really alive, playing golf, giving away new dimes* and telling stories with swear words in them. One American editor wrote recently that "John D. must have started to be a tremendously old man at a very early age; he looks like a mammified hold-over from pre-historic times compared with nis looks when he first got the world by the tail."

The following is today's Rockefeller's time budget or daily routine, carefully scheduled in advance:

6-30 A. M. gets up
7-8 reads morning papers
8 breakfasts
8-30—8-45 plays numerica or chats
8-45—10 attends to business affairs
10-15—12 plays nine holes of golf
12—1-15 takes bath and rest
1-15—3 lunches, plays numerica
3—5 takes auto ride
5—7 rests, is read to or chats
7 dines
8—10 plays numerica, visits, listens to music by his valet or house guest, sometimes has radio or moving picture show.
10 retires.

Other Rockefeller characteristics are told in many tales scattered through articles and biographies of him. His first personal biographer, a woman, sets the pace. His severest biographer, another woman, lauds his business characteristics. Friends, strangers and foes unite in photographing, painting and cartooning him as the following kind of man.

Rockefeller is extremely simple in his living and travelling, for a millionaire with homes scattered nearly all over the United States. Able to have anything in the world that money could buy, he leads an extremely simple life.

Rockefeller is thrifty but not stingy. "Were I a smoker I could not afford that" he told a wealthy friend who had just thrown away half a cigar. His economy is that of the conservationist, not the miser. He hates waste as nature abhors a vacuum and idealism a sterile life. He refuses to be imposed upon even in small purchases not because he cares for the money, but because his "money's worth" is as sacred as a moral principle.

Rockefeller is courageous and self-confident. It has taken courage to live his simple life, to give in the way he believes best, to flock by himself and to live his businesss life believing in his own uprightness and idealism as he says he always did. He rivalled Walt Whitman in being "a simple separate person . . . ultimate in his own right."

Rockefeller is unexcitable, incapable of surface agitation. His emotions knew no freshets or spring floods. He inherited a poker heart and face. At over ninety he has a heart beat of fifty-four. This psychological endowment he conserved, for it gave him control of himself and leadership of others. His partners "seldom knew what he was thinking but he always knew what we were thinking."

Rockefeller is not intimate. If he ever had talent for intimacy he curbed it. Intimacy means dependence and reciprocation. Neither could have built his fortune the way he built it.

He is persistent. Once having tasted railroad rebates, he never gave them up. Once having decided that he would change world hate to world adulation he "turned the trick" in little ways and big ways as thoroughly as he won in business deals. Told that he must play golf or die, he played golf and stopped doing or thinking or feeling whatever did not contribute to prolonging his life.

Rockefeller is punctuality itself, because, he says, "a man has no right to occupy another's time unnecessarily."

Rockefeller is politeness personified. Politeness was a system, an asset and a necessity in his case. Many a time his apple cart could easily have been kicked over by an absence of superlative politeness, while bad temper would have lost his leadership entirely. When pressed unsuccessfully for his trusts' minutes in 1883, he did not refuse or look ugly or snap satire. He graciously said:

> "It seems to me, Mr. Chairman, there could be left some little thing that you did not expect of us; it would leave a lasting and pleasant impression of this day's experience!"

Rockefeller is innately refined. He likes nice clothes, nice manners, nice language, nice habits, nice relations even among intimates, all the

* A dime is equal to about 4 annas.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri
Gurukula Library Kangri

niceties of courtesy. He dislikes vulgarity, including the vulgarity of display.

Rockefeller is loyal and inspires loyalty. His old gate-keeper and his secretaries are devotedly loyal. His path to glory has not been strewn with scapegoats. His loyalty, however, was to co-workers who acknowledged his leadership. He felt no loyalty to oil pioneers and inventors. He never went to the oilmen's reunion.

Rockefeller is dutiful. From his first earnings he gave duty pennies to his church. He reiterated to his Bible class that it was "religious duty to earn all we can and to give all we can."

Rockefeller is convincing. He was a superior salesman, so obviously superior that he forces his extreme modesty to concede it.

Rockefeller is generous in spots with small as well as large sums of money. His giving dimes seems stingy and silly, but giving gold eagles from his fortune would be almost equally stingy, more silly and socially injurious to boot. But any way year after year since 1913 his public charities have on the average exceeded $ 2,000,000 a year. They say in addition he does private charities, unknown even to his publicity agents on an average of $ 100,000 a year. He has lacked the social sense and demonstrativeness to show where he might have been generous oftener without violating his own standards of justifiable giving.

Other characteristics of him are as follows. He is above social posing. His home has never been a scene of revelry and he is perhaps the one American man of wealth who has not 'hob-nobed' with the titled and great of Europe. He is naturally militant. He wants what he wants, when he wants it but he does not want it until it can be had safe and sure. He can wait. His militancy is not violent. He is modest, retiring, almost self-effacing, by nature and by training. "Just a plain ordinary man," oil pioneers say. According to Joe Davison, the great sculptor for whom the oil magnate posed once, he is "sympathy compelling, a good listener and companionable once he admits companionship, not at all gloomy or uncheerful." He is optimistic by nature and by training. He calls optimism "seeing opportunity in every disaster" and pessimism "seeing disaster in every opportunity." He is exceedingly tolerant. He is "passionately fond" of music. He is an American first and last. World merchant, world benefactor, he nevertheless has remained surprisingly provincial and in Wall Street lingo, a "bull" on everything American. He is open-minded and progressive. He is a strict teetotaller and a prohibitionist. He is serious by nature, playful by cultivation. He learned to play after he retired from managing a world trust. He is honest-minded about his own greatness. He is self-disciplined, self-trained to stand without hitching. He is keen of wit, though not witty in the popular sense of the word. He is Emersonially as "harsh as truth and as uncompromising as justice."

Having dilated upon all the worthwhile characteristics of this really extraordinary man, let us see his other side. He is above all "a lone wolf." He is disingenuous, furtive, evasive, slippery, truthful in words but untruthful in meaning. He evaded legal perjury, but used moral perjury to get the same result. He is secretive and stealthy. "He would talk about anything except business," said an old associate, "business he would never discuss." He is inculpable, unmistaken and unrepentant. Never once has he publicly acknowleged a business wrong on his own part. In the American Senate enquiry, unperturbed he answered that he sought his country's greatness as well as his own. "Let none presume to measure the irregularities of Michael Angelo and Socrates by village scales." He is neither educated, cultured nor studious. Walter Page said "lacking in social versatility." If he has read little he has thought less. It is hard to understand his imperviousness to what goes by the names of "academic education" and "culture." Carnegie died of a broken heart because after all that he had done and hoped for peace, the civilized nations, including his own, had gone into a devastating and brutal world war. It is inconceivable that even Rockefeller's extremest eulogist could suspect him of ever suffering for an ideal or for other's suffering in any such way. He is essentially unimaginative, but yet creative in this sense, that out of other's imagination he has fashioned history-making organizations.

Master promoter of co-operation in business and philanthropy, he himself remains the spiritual catalyst,—he enables millions to co-operate but himself remains unchanged, unassimilated, a foreigner.

He is pathetically alone among his foundations and monuments. He even shuns the thought that his giving has earned for him and for mankind. He ends his life as he began it, in isolation, four miles from the City of New York.

Rockefeller is a symbol of modern life's routines and extremes, its rules and its exceptions. Every little village has a Rockefeller all its own; for Rockefeller is the full length mirror of his time. He symbolizes American opportunity. He represents America's rapid growth and its inability to improve its co-operation through governmental machinery rapidly enough to prevent a few men from gaining disproportionate unearned increments for their business skill and prowess.

Rockefeller symbolizes above all

Succes a l'American.

BOOK CENSORSHIP IN AMERICA

Ban On Naughty Volumes

By SUDHINDRA BOSE, M.A., Ph.D.

UNDER the American system, where the Constitution guarantees freedom of speech, freedom of Press and freedom of conscience, no individual or government has in theory the right to dictate to the adult what he shall read any more than what he shall think. One of the most familiar sayings attributed to Lincoln was that no man is good enough to be another man's master. Yet censorship, which has always been the tool of some sort of tyranny, is in full swing in America.

The United States Congress recently passed a law authorizing censorship of obscene or seditious literature by Customs officials. It prohibits importation into the United States from any foreign country of "any book, pamphlet, paper, writing, advertisement, circular, print, picture or drawing containing any matter advocating or urging treason or insurrection against the United States or forcible resistance to any law of the United States or containing any threat to take the life or inflict bodily harm upon any person in the United States, or any obscene book, pamphlet, paper, writing, advertisement, circular, print, picture, drawing, or other representation, figure, or image on or of paper or other material, or any cast, instrument, or other article which is obscene or immoral, or any drug or medicine, or any article whatever for the prevention of conception or for causing unlawful abortion, or any lottery ticket, or any printed paper that may be used as a lottery ticket, or any advertisement of any lottery." Thus America is saved again !

Under the new law over 700 books have been refused admission, 400 Spanish, 200 French, 100 English and a dozen in German and Italian. They include many of the classics of Europe. Defending the exclusion, an officer of the Customs Department said :

> "In passing upon such literature the bureau of customs has considered, primarily, its evil influence upon the impressionable minds of those persons the statutes, according to the courts, aim to protect—*i.e.*, the young and inexperienced. In examining the text it is sought to determine if the psychological effect of the language would be to create in the mind of the individual libidinous thoughts, and unduly excite the sexual functions or arouse the animal passions."

There is much difference of opinion as to what is obscene and what is not. Morality is relative. The Roman Catholic Church ordained in 1633 that Christendom should not take the moral risk of thinking that the earth revolved round the sun. Therefore, Galileo was censured and condemned. Some years ago the short clothes now worn by American women would have been considered obscene. Nearly all of the movies would have been considered obscene. Many books that now pass muster would also have been considered pornographic.

What is an Immoral Book ?

That customs officials should have authority to exclude from the United States any publication which seems to them of immoral character is preposterous. The principal weakness of censorship is that its limits are very difficult, if not impossible, to define so as to prevent abuse of power. There is a "twilight zone" in which opinion sharply differs as to what is censorable and what not. Many of the fights over censorship occur in this zone. Narrow persons would hang the charge of obscenity upon books, pictures, movies and plays which do not deserve it. Moreover, it seems rather foolish to be so concerned about keeping foreign obscenity out. The home product is worse—and there is more of it here in these United States. The plain truth is that foreign countries have not much on Americans in the way of indecent literature.

Hon. Bronson Cutting in a speech in the United States Senate declared that the American people should be trusted to take care of their own moral welfare and that no

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

bureaucratic guardian is competent to decide for them what they shall or shall not read.

"I admit that there may be those among us who will occasionally abuse those privileges," said Senator Cutting, "but I insist that the same men who would abuse those privileges would abuse the privilege of franchise. If a man is not capable of deciding what he may or may not read without injury to himself, then that man is not fit to be intrusted with the right to select his own representatives in the government. Some believe in the principle stated by Edmund Burke that the people have a right to be protected from themselves by the superior members of the community That is the theory which is adopted by the government of Mussolini and the government of the Russian Soviet at the present time. But it should not be adopted by the United States as a governmental policy."

The late D. H. Lawrence's booklet "Pornography and Obscenity," which has just been published, is a treatise of power and passion on censorship. The brochure roundly denounces the American and British censorships and derides their conception of pornography. Why is pornography disliked? Is it because it arouses sexual feelings? Lawrence dismissed such a reason as canting hypocrisy. "Half the great poems, pictures, music, stories of the whole world are great by virtue of the beauty of their sex appeal."

The court has held that any book is obscene which is unbecoming, immodest." This throws open the door to endless imbecilities, for it merely begs the question. Almost any printed allusion to sex may be argued against as unbecoming in this moral Republic, and once it is unbecoming it is also obscene. But "sex appeal" has become so much the commonplace of conversation that the sophisticated school and college girls in the United States refer to it as "S. A."

Protecting Plastic Mind

The moral gladiators of this country have not yet been able to answer adequately as to when a book is pure. It seems that most of the great literature of the West, with of course some exceptions, is "unbecoming and immodest." One can easily find naughty passages in Aristophanes, Lucretius, Petronius, Chaucer, Ben Johnson, Swift, Sterne, Fielding, Byron, Boccacio, Rebelais, Voltaire, Zola, Maupassant, Belzac, D'Annunzio, Provst. Isn't there a good bit in Shakespeare's "Venus and Adonis," "King Lear," "Hamlet," and "Romeo and Juliet" that won't do for the squeamish?

The Puritan gladiators full of characteristic pecksniffery swallow a camel, but strain at a gnat. I have not known any Puritans, even of the purest ray serene, to admit that the great classical offender against obscene language and improper stories is the King James version of the Holy Bible. There are many odd tales in the Book of Judges as there are in Chaucer. The story of Ruth, much quoted in the evangelical churches, is certainly spicy. And how about the voluptuous strophes of the Song of Solomon? In 1895, one Mr. Wise, of the State of Kansas, sent a quotation from the Holy Writ through the United States mails, and was found guilty of mailing obscene matter.

Professor Harry Elmer Barnes, author and sociologist, in his important work *Twilight of Christianity* has included an anthology of scriptural obscenity, a few samples of which are reproduced below:

Genesis 19 : 30-38. 2 Samuel 13 : verses 12 and 14. 2 Samuel 16 : 21. Genesis 30 : 15, 16. Genesis 38 : 14, 18. Leviticus 19 : 29. Ezekiel 16 : 15. Genesis 38 : 8, 10. Genesis 12 : 15, 18, 19. Ezekiel 14 : 9. Jeremiah 20 : 7, 4 : 10. Deuteronomy 14 : 21. Luke 1 : 5-25. Esther 2 : 12-17. Judges 19 : 24. Genesis 19 : 8.

I do not believe that there should be censors to act as watch-dogs of our morality. But the moral experts, the professional sin-hounds, have not yet seriously advocated censoring and sterilizing the Christian epic. Perhaps the lascivious portions of it are too gross to be very dangerous to "civilized" Westerners. Anybody can borrow an unabridged and unexpurgated Bible, or go to a Y. M. C. A. lamasery and read the Word of God, and verify the above references for himself to be convinced of the essential soundness of my observation. But why are the Christian theologues, generally loud in their demand for censorship, so magnificently silent on these points?

An important feature of the new censorship law is that it prohibits the importation of radical literature. There are many foreign books and pamphlets which for the most part contain elaborate discussions of far-reaching social and economic changes, which it is very desirable to read. Here and there the author

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

is so impressed with the hopelessness of legal change in the present system that he advocates resort to force, if nothing else serves. That alone will render importation of the whole book impossible.

"Many of the classics of modern economics will be put on this new index expurgatorious," points out Professor Chaffee of the Harvard Law School. "The law will prevent a loyal citizen from obtaining from abroad the works of Marx, Proudhon, Bakunin, or Stirner. Even if we could wisely dispense with these left-wing books, much less radical publications will be excluded." For example, one of the sanest discussions of contemporary political social thought which has had a large sal the United States is Bertrand Russ *Proposed Roads to Freedom.* The fur importation of this book from England wo be forbidden because of its extracts f Communist Manifesto of 1848 and f anarchist songs. Manifestly, the censor law assumes that the American people so stupid that it is unsafe to let them anything about revolutions, because would immediately become converted. seems a sad state of affairs.

A PLANET AND A STAR

By NAGENDRANATH GUPTA

XLIII

IT was incredible, but it was true.

As the aeroplane shot up high into the heavens the first rays of the rising sun appeared in the east, the rosy mist curtain of Raba being in the distance and the glory of the sun-rise was before our eyes. But we had no eyes for any of these. We were looking at Narga. She was a little out of breath, her lips were slightly open, and her bosom was heaving gently. She must have come away in a hurry for the great wealth of her hair was loose and fell in a cloud over her shoulders and bosom. There was a look of fear, now passing in her eyes, mingled with an expression of relief. For the moment she was not the high priestess gifted with almost miraculous powers, but all woman, beautiful beyond the most wonderful dream of loveliness yet weak and timid as becomes one of the gentle sex. We knew that the priestess had been left behind at the monastery of Opi and we were carrying with us a fair woman who had sacrificed everything at the altar of love.

Maruchi and I exchanged a look and our lips simultaneously formed the words, 'The living evidence!'

There was not the slightest doubt about it. It was now quite clear what Ashan the Master had meant when he had told us that we would carry with us a living evidence of our visit to the planet we were now leaving behind us. His prophetic vision had foreseen what was now an accomplished fact.

Narga was the living evidence!

If the Master had told us that Narga join us when we left Opi on our homeward it might have led to unexpected complications. bewildered astonishment might have found in some indiscretion, either of speech or a The Master knew what was going to happen he would express no opinion nor would anything to interfere with the freedom of Na choice.

We might have searched every country in and we might not have found another Narga. She was not only incomparably beau but she had attained a wisdom and a know which placed her on a level higher than our while her psychic powers were beyond comprehension.

Narga, who was sitting on a low cane stood up and stretched out her hands. 'Raba! Raba!' she cried, 'Thy handm bids thee farewell for all time, for she will again set eyes upon thy glory or be fit for service.' The last words came as a of despair and she burst out in a passion of

We were very much surprised and distressed. We had never thought that was like other women, or could be easily to tears. We had seen her in her cr strength, in her queenly imperiousness and possession of her strange power. Her mood seemed quite inexplicable and we know how to comfort her. Orlon, who was quite aback, blunderingly said, 'If you having come away with us—'

'I regret nothing that you can think of,' rupted Narga, wiping her tears, 'I have no

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

it can cause me any pain in breaking them. e wrench is in giving up all that seemed to after so long, the higher life which alone seemed me to be worth living. How can I help getting what I have lost? Yet if I had the ce I would not go back to Opi. It has been ggle that has torn me for months and my t has conquered. And that heart is yours, Orlon.'

She looked at Orlon with infinite tenderness Orlon took her hand and pressed it.

Ganimet brought in some cups of tea and e and crisp biscuits. Our larder was well ked and besides the large supply of specially pared food we had originally brought with and which was in perfect preservation we had nished our stores with large quantities of fine ts, nuts, beans and other wholesome food ht in the places we had visited. Maruchi ught some fruit and offered it to Narga who ked him and took one.

Maruchi's little cabin was the best on board ship. He took out from it everything that nged to him and placed all his things in n's cabin which would be shared between m. Narga's bag was taken into Maruchi's n which was quite comfortable. There were rewed down bed and an easy chair, a small stand and a mirror. Narga, who was now composed and had recovered her self-possess- was invited to have a look at her room and was quite pleased with it.

oming out to what I may call the common g room Narga invited me to sit by her side. r, my brother,' she said 'sit next to me.' or the first time she called me brother and very happy. Maruchi and Orlon sat on ther side of her.

arga raised her eyebrows and smiled archly. you still angry with the spy, Jomel?'

We laughed. 'No,' I said, 'we are very much ful to him He was of great help in hasten- our departure.' And then I told her of all had happened after I had caught the man ng in the wood and how Karos had been ed when he endeavoured to take Jomel away our company.

arga was greatly amused and next wondered would happen to the monastery. 'Karos good man,' she observed, 'but he is not very or strong,' and the other monks may not him. The women will refuse to stay there unless the Master puts some one else in e the affairs of the monastery will not be erly controlled.'

said, Narga, the Master knew you would away with us.'

arga did not look surprised but she appeared y perplexed. 'Did he tell you in so many d?' I answered, 'what he actually said was we carry with us satisfactory proof of our visit to Heperon, but he refused to tell us anything more and left us wondering.'

'The master knows anything that he wishes to know, for nothing is hidden from him. He has even told me how it is done but I cannot explain it. There is some subtle power possessed by the higher adepts of throwing light into the darkness of the future and foreseeing events still to happen. What seems strange to me is that I have had no message from the Master, and I don't know what he thinks of me.'

'So far as we could understand the Master knew of this step that you have taken but he expressed no opinion and merely said events cannot be diverted from their appointed course. But how could the Master send you a message?'

'That is beyond your knowledge and your understanding. You know the Master possesses several powers for which you cannot account.'

'So do you.'

'Well, there are spirit and soul messages as well as those you send through ether.'

I asked no other questions and Narga became silent. She cupped her chin in her hands and gazed at the planet which we had left a short while ago and which was rapidly receding in the distance. The sunlight was now flooding the sky all around.

The veil of rosy vapour which hung over Mars was thick in certain places and thin in other places. The geographical features of the planet could be sometimes clearly and again dimly distinguished. We could see the mountain crests, white in some places with the snow flashing in the sunlight and red in others. The placid stretches of sea and lake were visible as through a pink glass, while the outlines of large cities could be made out.

Maruchi handed Narga a pair of powerful field glasses and Narga continued to watch the planet she had left through them. The aeroplane was travelling at a tremendous speed. Gradually the view of Mars became blurred and we saw only a large mass about which hung a rosy haze.

Narga sighed gently and put down the glasses. She looked at me and said, 'We are moving very fast. It must be very cold up here. How is it that I don't feel it?'

'The cold outside is so great that we should be frozen to death in a short time if we had no equipment for the production of artificial heat. Come and see.'

I first showed Narga how the airship had been made impervious to the cold surrounding it. The machine was in fact hermetically closed except for the aperture through which the air that we breathed was allowed to escape. This worked automatically and was so arranged that the cold could not enter the machine. I showed Narga how the heat was generated by electricity and how easily it could be regulated. We maintained a uniform temperature which was comfortably cool. I told Narga that we had not only to

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

keep out the cold but to produce air artificially so that we might breathe and live. Narga saw everything with the greatest interest and then spoke to Maruchi, 'You are a great and a wonderful people.

Maruchi shrugged his shoulders. 'Yes, we are great as mechanics and inventors of machines but what do we know of the higher things, what do we understand of the powers that you and the Master possess ?'

'True, but if it had not been for your marvellous inventions we would have never met,' and she smiled at us graciously.

After some time Narga retired to her own room. Ganimet, who had passed more or less a sleepless night, went to sleep as he would have to relieve Nabor in a few hours. Maruchi, Orlon, and myself discussed the extra-ordinary events of the last few days.

Maruchi said, 'Orlon, I have not yet congratulated you. Indeed, I find it difficult even now to believe that Narga is in this ship travelling with us to our own planet.'

'I can scarely realize my own good fortune. Narga is so far above me that I cannot understand how she has come down to my level and agreed to share my humdrum life.'

'What strikes me as most wonderful,' I said, 'is that in his distant hermitage Ashan knew everything and yet he made no sign. He regrets this decision of Narga to come away with us for you will remember that when he spoke of a living evidence of our visit he said he wished it were otherwise, but he would do nothing to prevent things taking their course.'

Maruchi said, 'The Master must have had his reasons. We cannot conceive what they were, but the fact that he sent no thought message to Narga is significant. There is undoubtedly some great purpose behind this new turn in Narga's life.'

'You, Maruchi,' I said, 'dreamed of a marriage of the planets and your dream has been fulfilled.'

'I am delighted beyond words,' answered Maruchi. 'When Orlon marries Narga the two planets will be united in holy wedlock.'

'I pray I may prove worthy of her,' said Orlon.

When the day passed Narga sat with us watching the stars and peering into the blackness of such a night as is possible only in space. She spoke mostly to me, though her eyes occasionally strayed to Orlon. These two exercised complete control over themselves. There were no furtive glances, no whispered endearments, no squeezing of hands. They knew that at the end of our long voyage they would become man and wife and that knowledge was sufficient. Of course, the love-light sprang to their eyes when they looked at each other, but they were lovers who kept a strong hold upon themselves. Narga had demonstrated the greatness of her love by her unparalleled sacrifice. She had bidden farewell not only to Raba but to the planet on which she was born. Love had conquered all but Narga was far greater than a mere love-sick wo and there were years of stern self-discip behind her.

For a long time Narga remained silent then she spoke slowly and thoughtfully wit addressing any one in particular. 'The se called boundless because its shores cannot be when one is on the high seas, but what are seas compared with the sea of space? We of a drop in the ocean but a world is than a drop in this ocean. It is space that us a definite idea of the infinite. We may be able to compass space but we can compre it and that is our first claim to the higher of intelligence. To be able to navigate th without getting lost was regarded as a triumph, but what words of praise are ade for the navigators in the sea of space ? Do think we might get lost in this real sho sea, my wise brother ?' concluded N turning to me with a smile.

'We certainly would lose our way if had been no landmarks. But infinite as i sea through which we are passing it is over with floating and flying islands for we can steer when we seek a port. In one that part of space in which the solar syst whirling is a known sea for there are the p we know and they may be worlds like your ours. If it could be possible for us to go be the solar system then we would find our in an unknown sea, though even then would be no question of losing our way.'

'That is the wonder of it all. Even in fearful darkness you cannot get lost. There lighthouses everywhere in this infinite se as warnings of danger but as harbour And while everything else moves space al at rest.'

It was fairly late when Narga retired for night. Besides the pilot we had settled that three of us should keep awake by turns, t a watch of two hours each. We were a that one of us should be waking and at hand case Narga should feel nervous or want any in the course of the night.

XLIV

The night passed uneventfully. Narga a very early riser and she came out of room after her morning ablutions and pr She greeted us cordially and then looked through the closed mica panes.

In the growing light Mars, now a mass dull red, was vanishing from sight. The planets and stars were also becoming in and the light of the morning sun was spread through the clear ether.

After a light morning meal Narga took her near me and said, 'You have learned our lan but I do not know yours. Please teach me so that I may be able to speak it by time we reach your country.'

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

'Would you like to learn to read our language?'

'Certainly. But let us begin with the names of objects and simple sentences. Teach me first by word of mouth and then we can take up a book.'

And so the lessons began and Maruchi and Orlon watched Narga's progress with much interest. As we all expected Narga proved to be an apt and a quick learner. I pointed out the objects lying about us and she learned their names at once. At first I avoided long words as she naturally felt some difficulty in acquiring our way of pronouncing these words, but she learned a large number of words and several easy sentences very quickly. It was not merely by repetition which is the usual method of memorizing that she learned new words and sentences. She had an extraordinary power of concentration. Whenever I mentioned a new word and explained its meaning she would listen with close attention and then fix her mind upon it for a moment. She knew and remembered the word at once. As we went on I tested her occasionally by putting a question about some word or sentence I had taught her a little while ago and her answer was invariably correct.

I expressed astonishment at the ease with which she was acquiring a new language and Narga smiled.

'You mustn't forget,' she said, 'that I was taught by the Master for five years and he has his own method for cultivating the memory. He despises all mechanical systems and he is not content by merely stimulating the intellect. In his eyes the mere repetition of words is nothing more than a parrot's education. He taught us wisdom and we read several books dealing with very profound problems. The only memory which the Master values is the memory of past existences, but this is possessed by very few.'

'Does the Master believe that this particular phase of memory can be cultivated?'

'To a very limited extent. It is in reality an individual gift. It is not an intellectual possession, for a person with intellectual powers may not have even rudimentary very high spiritual powers. The Master does not accept a merely clever or intellectual disciple. He has some means of forming an opinion of the past lives of the persons that approach him to seek instruction and he selects only those that appear to him to be the fittest by the trend of their previous lives.'

These were deep waters and in another moment I might find myself floundering beyond my depth. So I gave another turn to the conversation by saying to Narga, 'If you have no objection, we should very much like to hear all about yourself. We met you at Opi and we know that you studied with the Master. But tell us about your people and your life before you renounced your world.'

Narga laughed pleasantly. 'Since the rest of my life is to be spent in your land it is but right that you should know about me the littlle there is to tell. There is an ancient town, at one time the capital of a powerful kingdom, between Opi and Sipri. It is now a small town with many magnificent ruins all around it. My ancestors were allied to the royal family and had a great reputation for learning. They were in easy circumstances but not particularly wealthy. My father specially was greatly respected for his learning and wisdom. I was an only child and was brought up with great care. My mother who was a very beautiful woman and of a very gentle disposition, died when I was twelve years of age and I was left wholly to my father's care, and he treated me more like a son than a daughter. I was a very serious child and spent most of my time studying with my father. Children of my own age did not attract me much. Perhaps I was somewhat precocious for I remember that even as a little girl I used to ask my father many questions on intricate subjects and he seemed to be pleased that I had inherited the family tradition of a desire for knowledge. When I was about sixteen years old my father suggested that I should be married so that I might not be left unprotected when he was gone. I vehemently protested saying I would never marry as no young men attracted me and I had made up my mind that I would devote my life to the pursuit of knowledge. My father was somewhat surprised but he did not insist on my marriage and left me free to follow my own inclination.

It was about this time that Ashan, who in those days used to travel occasionally, came to our house and stayed some time with us. You have seen him and you know how great he is. He looked then as he looks now for the passing years appear to touch him very lightly. I was not only deeply impressed by his personality but I was also astonished by the reverence shown him by my father who himself was not an ordinary man. I learned from my father that Ashan was one of the great teachers who appear among men from time to time and he possessed miraculous powers. I felt strongly drawn to the Master, who at first looked upon me as a child, but was greatly interested when he found out that I was studious and thoughtful. He told my father that he was greatly pleased to find that I had made such good use of my time, though so young. After questioning me as regards the range of my studies he spoke to me on higher subjects and I found to my delight that he had a solution for the problems that so often perplexed me. I listened to him for hours with rapt attention for I had found a teacher whose wisdom was unbounded and to whom the deepest mysteries were like an open book. The doctrine of past incarnations fascinated me strongly. When I asked questions about the Master's possession of strange powers, he said they came only to the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

initiated and the adept, but they did not form the primary objects of knowledge.

While the Master was staying with us my father suddenly died after a very brief illness. Before his death he consigned me to the Master's care. I was overwhelmed with grief for I had lost both my parents and was left alone in the world. For a day or two the Master left me to my grief and then he spoke to me such words of consolation as helped to withdraw my mind from despair and set it thinking on the problem of life and death apart from my personal loss. I understood there is no such thing as death and relationships are casual. Some days later the Master said I should go and live with some relations as he was about to return to his hermitage. I said I would go with him as I wanted to be initiated as his disciple.

The Master was taken aback and tried to dissuade me on the ground that it would be a very hard life, that I was a girl and should be married and settled in life. But nothing would turn me from my resolve. I said there was no absolute law that all women should be married any more than all men, and a woman has as much right as a man to aspire to the fulness of knowledge. This the Master could not deny but he spoke of my personal attractions and pointed out that some one might fall in love with me. I was a rather petted and pert girl and told the Master that it required two whether for a quarrel or for love, and I knew perfectly well that I would love no man. I grew so bold that I rallied the Master saying that he was a very handsome man but he had not permitted any woman to fall in love with him.

The Master laughed and was then lost in thought for some time. Then he said slowly with great deliberation, and I remember his words to this day. 'Perhaps you are right. It may be quite possible that you may love no man here. But who can tell what the future may hold in its closed palm ?'

The Master yielded to my earnest entreaties and I accompanied him to his hermitage. He was like a father to me and treated me with the greatest kindness. But as he told me there was no royal road to knowledge and after my initiation I had to undergo a very severe course of discipline. So great, however, was my desire to learn that I was never discouraged and my enthusiasm never abated. I forged ahead of the other disciples and needed no pressure of any kind to pursue my studies and subject myself to the rigorous self-discipline necessary for the cultivation of psychic powers. The Master was both surprised and pleased, and seeing how apt a pupil I was gave me more time than to my other fellow-disciples. He spoke to me at great length about the earlier teachers of our race and how they had advanced in knowledge from birth to birth, and how the past and the future were revealed to them like a book one has already read. I applied myself assiduously to develop the spirit force inherent in us and in the course of three years the Master admitted me to the first degree of an adept and imparted to me more esoteric knowledge. Then he took me to Raba and I passed through the secret passage without help, following the Master with ease over the open chasms and going the round of Raba through the air. Two years ago the charge of the monastery and convent at Opi fell vacant and he sent me to fill the vacancy. The monks were at first somewhat surprised to find that a young woman had been placed in authority over them, but they afterwards approved the Master's selection.'

We had listened to Narga's narrative with great interest and when she had concluded I ventured to ask whether the Master had told her anything when she departed for Opi.

'Yes,' she answered gravely, 'he said I was more gifted than any one else he had taught but I was impetuous and impatient by nature and he was not certain about my future. He refused, however, to make any attempt to read my future saying it must be something quite out of the common and there was nothing to be gained by finding out what could not be prevented."

We remembered that this was precisely what the Master had told us also. I felt doubtful whether this subject should be pursued. Noticing my hesitation Narga said, 'Ask me anything you will and I shall tell you all I know. Between us there can be no reserve and no secrecy, and I have nothing to keep back from you.'

Still I hesitated but Narga evidently waited for more questions. Then I asked, 'Have you any idea now as to what was at the back of the Master's mind when he spoke of your future ?'

'I had no idea then, but is it not now evident what he was thinking of ? But he resolutely refused to turn over the page of the future because what is written cannot be wiped out.'

I would not ask any other question, but Narga looked at Maruchi and myself, and she blushed as her eyes met Orlon's. If she had been an ordinary woman perhaps she would have felt shy and turned the conversation to some other topic. But Narga was accustomed to analyse her own thoughts and was quick to read the thoughts of others and we knew that she was frankly outspoken. She went on quite dispassionately, 'You are loyal-hearted gentlemen and you naturally feel this is a delicate subject since it refers to my present position. I am not sure what must be the thoughts of the Master but Karos and the others must be thinking me a shameless, fallen woman, and if they could get at me they would stone me to death without pity.'

Maruchi protested vehemently, saying that we held her in as great honour now as we did at Opi.

Narga smiled and said, 'Yes, because I am the living evidence of your visit to Heperon.'

We started. She was repeating the Master's

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

own words. Had she overheard our thoughts or caught the words as our lips formed them without uttering them? Narga went on as if she had not noticed our movement of surprise. 'How was it possible to foresee the future in my case? In our own town I had seen many young men, some of them quite good looking and had noticed the admiration in their eyes when they looked at me. But my heart was never stirred and love seemed to me to be a silly thing. What had I to do with love when I thirsted only for knowledge? When I had passed through the period of probation under the tutelage of the Master I was firmly convinced that the world held no bonds for me and my emancipation was complete and it remained only for me to advance along the path of wisdom and knowledge until the goal was reached. How could I dream for a moment that my fate was linked with another, a being from another world? When I gazed at night at the starry heavens, and I did so every night, I wondered what sort of beings peopled Lamulo and the other planets, but how could I imagine that men living up there would come down to our planet, or that the future course of my life was bound with one of them?'

A look of great tenderness came into her eyes as she looked at Orlon, but she was not an ordinary woman whose lips could be closed by any notion of false modesty. She was no more ashamed of her love than she was of her wisdom and she proceeded calmly with her argument as if she had been discussing the affairs of another person. 'I do not for a moment doubt that what has happened to me is most wonderful, I know that much of what I have attained will be labour lost and the powers I have acquired will vanish. At the same time, I feel that a complete life is a rounded whole and there must be some gap which has to be filled up and I have to retrace my steps in the long journey from life to life in order that the gap may be closed and I may start afresh on my interrupted progression. When we renounce the ties of this life it means that those obligations had been fulfilled in some other life. There can be no hiatus, we have to tread every step of the road that stretches before us in life after life; there are no shortcuts and we cannot jump over any distance. The wonder is that the fulfilment of my destiny should be divided between two worlds.'

Narga ceased and fell to silent musing. We held our peace.

(To be concluded)

DISASTROUS TWILIGHT

By VERRIER ELWIN

I sat beside the river bank,
Where the great waters silently
Flowed from the forest, silent, dank,
The trees bent over me.

Across the sky there crept the night,
And in the little village there
They had not even candle-light,
So very poor they were.

Then through the darkness distantly
A song of women came to share
The burden of their poverty,
The measure of their care.

They should have sung of royalty,
Lordship of elephants and gold,
Of lands that broadened as the sea,
Hearts that were true and bold,

Of the great forest's liberty,
Kingship of forest free and proud,
Strong pride as of the tallest tree
Lifted above the crowd.

They should have sung such royalty
As gave their fathers wings
To rise from dim antiquity
Into a race of kings.

And yet those unseen women sang
Only a tale of poverty,
And all the darkened village rang
With that strange tragedy.

Book Reviews

Books in the principal European and Indian languages are reviewed in The Modern Review. But reviews of all books sent cannot be guaranteed. Newspapers, periodicals, school and college text-books, pamphlets, reprints of magazine articles, addresses, etc., are not noticed. The receipt of books received for review cannot be acknowledged, nor can any enquiries relating thereto answered. No criticism of book-reviews and notices is published.—Editor, The Modern Review.

ENGLISH

THE WORLD CRISIS AND THE PROBLEM OF PEACE: *By S. D. Chitale. International Book Service. 1933. Pp. 230. Poona, India.*

I have not read from any source a more clear, concise yet comprehensive, interestingly told, scholarly and fair-minded account of the world's present economic and political crisis (crisis as regards world-peace) than I find in this attractive book from a scholar in far-off India.

The claim is made by the author that the present crisis, the impending danger of another world-war, is the result of imperialism, or imperialism linked with capitalism. Given the imperialism and capitalism of the preceding half century, and the great war of 1914-18 was inevitable. Given the continuation of imperialism and capitalism as they still exist, and another world-war is certain to come. The author traces the origin of imperialism in its four most important modern developments—those of Great Britain, France, Germany and Russia. In other words he traces the acquisition (theft) by those nations of vast territories in Asia, Africa and the islands of the sea, and the domination of those territories as "possessions" or "colonies."

The cause of the thefts was capitalism, or national greed. The instrumentality by means of which this national greed was able to attain its ends—that of stealing territories and thus obtaining colonies and foreign possessions was militarism—which means the creation of great armies and navies. The danger that all this would create wars between these imperialistic nations was not very great so long as the thieving "was good," that is, so long as there were fresh possessions to be acquired. But when all the territory was appropriated (stolen), then the inevitable crisis came. Each nation was dissatisfied at not having obtained more. Each was envious of the other. Each wanted a larger place in the sun. Of course, this meant that they all must have bigger armies and navies to protect their loot, and to be ready to avail themselves of any possible opportunity to grab territory from the others. Thus it was only a question of time when they would fight one another. Hence the Great War.

When the war of greed was over, of course, the settlement—the Versailles Treaty—was one of greed; how could it be anything else? The idea that such an imperialistic war, capitalistic war, greed war, war caused by thefts and waged to protect thefts, could "end war," could bring "protection to small nations," could "make the world safe for democracy," was the sheerest idiocy. That America could ever have been made to believe it, is one of the most amazing facts in all history.

After telling excellently well the story of all this the author tells equally well the stories of the "Reparations," of "Lausanne," of the "Tangle of War Debts," and of the effect of all these in creating the world catastrophe, the world collapse, from which all nations are suffering, and which he believes is certain to bring on another World War, unless some new way out can be found.

Where can another way out be found, and the another war be prevented? Not by capitalism; not by imperialism; these will only plunge the world into deeper and deeper ruin.

He has no faith that the League of Nations can help, because that was created by the capitalistic and imperialistic nations; and is controlled by them, he believes, for their own ends.

He believes that in one direction and one only there is light. What he proposes is a world-wide organization of *peoples*, for world-justice and world-peace. It should take the form of a *popularly elected World Peace Committee*. Its members and managers must not be chosen by the nations as such, that is, by national governments, because all governments in the world, except that of Russia, are largely if not wholly controlled by capitalists, imperialists and militarists. They must be chosen by the peoples of the world themselves; because as he believes, the vast majority of the world's peoples do not want war, but do sincerely want world-peace and such world-justice as will maintain world-peace.

In addition to the World Peace Committee, as its constant practical Executive, or Working Body, the author would have a permanent *World Board of Judges* (from ten to thirteen in number) chosen by and by the World Peace Committee, whose duty should be to work constantly, in such ways as shall

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

seem to them wisest, to promote the interests of peace everywhere. If differences arose anywhere between nations, or between parties or factions in any single nation, which seemed likely to lead to war, the matter should be taken up at once by the World Board of Judges, or if necessary by the World Peace Committee itself. If the contending nations or factions refused to heed the verdict and insisted on going to war then a world-wide economic-political boycott should at once be set in operation against them.

Such is the author's plan for preventing wars. Of course, the question arises at once: Is the plan practicable? Can it be made to work? *At least, is it not worthy of careful consideration?*

One of the unquestionable valuable incidental features of the book is that it points out the important place which India holds, and must hold, in the economics and the peace of the world.

J. T. SUNDERLAND.

INDIA IN TRANSITION: *By D. Graham Pole. Hogarth Press. London.*

The English voters, it is often claimed, are the ultimate rulers and controllers of the destiny of 350 million people of India: viceroys, governors, and the rest of the political office-holders in India are merely the agents and emissaries of English citizens. As "trustees," so runs the story, it is the English electorate which is finally responsible for what happens to India's "voiceless millions." Yet the great mass of the English electors are either stupidly ignorant or cynically indifferent to Indian affairs, except on those few occasions when some sensation-alized news of the so-called religious feuds or political murders in India find their way to the Londonese press and it starts its bellowings. It is under this sad conviction that D. Graham Pole has written *India in Transition* and Wedgewood Benn, ex-Secretary of State for India, has contributed a Foreword. But I suspect that not many English voters will ever look into the book.

The author, however, has done his best. He has made a historical survey of recent political events and has also given an outline of the more important social and economic conditions. He tells about the machinery of Indian government, the workings of the recent political reforms, the results of the Round Table Conferences, the demands of the Indian National Congress, the Simon Report or rather the Simon travalogue.

The material is drawn largely from official documents. The book lacks an index. Though somewhat sombre in tone, it is free from obfuscation and is quite readable. It is a straightforward account of Indian affairs and how they came to be in such a tangled mess. It reflects, on the whole, the viewpoint of the civilized minority of the British Isles. I cannot, therefore, undertake to say how long the book will be allowed to circulate unmolested either in India or in England.

The main thesis of Mr. Graham Pole is that the London Parliament should come to honourable terms with India without further delay and give the Indian nation a real self-government while there is yet time, and not "try to hold on until we lose everything, even respect." For nationalism, as is suggested, has already sounded the death-knell of imperialism. The situation calls for a new moral order.

Truth will prevail, all obstructionists to the contrary notwithstanding. That is the one reason why I believe that the domination of one people by another cannot last for ever. At its core festers a cancerous lie. It gnaws at one's moral and spiritual tissue. A mind that does not see it is beyond the reach of reason and humanity. The mind of D. Graham Pole does see it; but most of his fellow-countrymen in their island home seem to have taken a moral holiday, and are apparently even unaware that their holiday has become a sadist debauch.

It is a pleasure to commend Mr. Graham Pole's *India in Transition* to students of the Indian problem.

SUDHINDRA BOSE

THE INDIAN THEATRE, *its Origins and Later Developments under European Influence, with special reference to Western India. By R. K. Yajnik, M. A., Ph.D. George Allen and Unwin Ltd., London, 1933. Pp. 284.*

The full descriptive title of the work is given above in order to indicate its object and scope, but one might complain after reading the work that the title is somewhat misleading. It is true that Part I of the work deals with the question of Sanskrit origins, but the author appears to be more concerned with its later developments, by which again is meant exclusively the modern vernacular theatre of the 19th century, produced almost entirely under the influence of the European rather than the Sanskrit theatre. But the author makes ample apology for this procedure. The Part I of the work is to be regarded merely as preliminary, for the book really attempts a fairly wide, if not exhaustive, survey of the activities of the modern vernacular theatres of India. As the modern Indian theatre has developed, at least in its earlier stages, somewhat artificially under direct European influence, the question of borrowing, adaptation and imitation of foreign models naturally receives the largest attention. The problem, however, is approached more from the point of view of its theatrical bearings than from its strictly literary aspects. The author has claimed that no relevant matter of importance has been overlooked. Judged with reference to the limitation which he has himself set to his task, it is possible to allow his statement. But his strictly limited point of view has naturally obliged him to give a rapid survey more of stage representation than of the drama and omit a detailed study of individual works and authors of importance. He has again placed a greater emphasis on the problem of direct translations, adaptations and borrowings, especially of Elizabethan in general and Shakespearean plays in particular. But the larger and more important problem of the assimilation of Western dramatic ideas and ideals does not appear to have received the attention it deserves. The question is not merely one of contact but of the moulding as much of literary form and expression as of its inner spirit and outlook. The earlier vernacular productions, to which the author has devoted the greater part of his work, contented itself with direct and obvious imitations, but when we come to later plays the influence is more subtle, because it is no longer a matter of mere borrowing but of deeper assimilation. It is nevertheless a question of much greater interest and undoubtedly deserves more careful study.

The author himself admits that Part I of the work, which deals generally with Sanskrit theatre and dramaturgy, is of different value, but it is retained for a certain continuity of treatment which involves an introductory exposition of the theory and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

practice of the Sanskrit theatre. To the Sanskritist this part may not appear to have maintained a high level, but it is obviously meant for the general reader. But, even admitting this, its connection with the author's particular theme of the modern vernacular theatre has not been made very clear. It is given more as an historical introduction than as an historical background. It is true that the conditions of growth and expansion of the modern Indian theatre under direct foreign inspiration were entirely different, but a certain measure of the influence of the older Indian theatre, both popular and literary, still persisted and shaped some aspects of its form and substance. This phase of the problem does not seem to have received its proper treatment; and the connection, direct or remote, of the new theatre with the old should have been more clearly indicated in order at least to justify the inclusion of Part I.

The work is one which it is hardly possible to review in detail, especially when the reviewer's knowledge of vernacular productions other than Bengali is limited. As a pioneer work opening up new ground of considerable interest, the reviewer has, however, no hesitation in extending to it a hearty welcome. It is impressive by reason of the large mass of scattered material examined and the amount of labour and skill that it has involved. Even if there are inaccuracies, which may be remedied, and gaps which may be filled in time when the vast subject is more completely examined, we have in this handy and well-printed volume a wide and intelligent survey which is undoubtedly full of interest.

S. K. De

INFLUENCE OF RELIGION ON HISTORY: *By C. Narayanswamy Mudaliar, Deputy Assistant Controller of Military Accounts (Retired).*

The book is misnamed. It is neither a history nor a study of religion, nor does it say anything as to how history has been influenced by religion. It is at best a summary of the author's readings about religious ceremonies and practices in different lands.

The present volume is only part I. Other parts are perhaps in the making. It has no chapters and no headings. It flows on like a great river with occasional bends, *viz.*, sections. But even there, there are no headlines to tell of the subject-matter. And within the sweep of 154 pages, we have excursions into the religions of the Zulus and the Egyptians, the Babylonians and the Romans and what not.

The language of the book is florid but not perspicuous. We are told of a "mundane world" (p. ii), of "dumping ground of travellers," who see with "travelling vision" (p. 75), and of how "vegetation supplied the prolific imagination to ply its own presageful trade" (p. 127), and of "a very grand, sublime, pathetic and tragic spectacle" (p. 140), of "indecent morality" and "true perspectiveness vanished" (p. 146), and we are also told of peoples who "left an indelible mark on the pages of the history of the world by their sanguine hopes in after-life" (p. 88), and last but not least, of how functionaries arose in Egypt "to guide the laity through the difficult mazes of life successfully and to carry the ship of state sublimely to the shores where breathes a balmy breeze of sweet morn and eternal peace" (p. 93).

Words and phrases are hurled at the reader with a merciless rapidity.

U. C. Bhattacharjee

THE GOLDEN BOAT: *Rabindranath Tagore. Translated by Bhabani Bhattacharyya, George Allen and Unwin Ltd., London. Nov., 1932. 4s. 6d.*

More than thirty selections appear in this volume culled with taste from the writings of Rabindranath and rendered in English with skill by Mr. Bhattacharyya. The translator is a close student of Tagore's and it may be hoped the book will find its way to the lovers of the Poet. Some of the selections appear to be of the very best; such are "The Strange Beggar," "Path Way," "Farewell to Heaven." The prose is rhythmic, simple and terse.

GITA EXPLAINED: *By Dnyaneshwar Maharaj. Translated into English by Manu Subedar, B. A., B. Sc. (Econ.) London, Bar-at-Law. Published by M. Subedar, Palli Hill. Bandra. Price Rs. 2 (Paper bound), and Rs. 2-8.*

Dnyananath, a disciple of Matsyendranath and a scholar of vast erudition born in the thirteenth century, wrote what is believed to be the first commentary on the Gita in Marathi, consisting of about nine thousand couplets. This standard work, one of the most prominent contributions to old Marathi, has been put into new garb by Pandit Govind Ramchandra Moghe and then Englished by Mr. Subedar.

It is a pleasure to read the English translation in the volume under review; we are at once introduced to a work which is comparatively unknown outside Maharastra, and realize what excellent treatises we have in the Indian vernaculars, awaiting translation and publication either in English or in Hindi. The wealth of examples is one of the glories of Dnyaneshwari, and the present version opens our eyes to the richness of the book from this view-point. The publication will be enjoyed by those who are interested in the Gita and its teachings.

Priyaranjan Sen

WHAT EVERYBODY WANTS TO KNOW ABOUT MONEY: *Edited by G. D. H. Cole. Published by Gollancz. Pp. 544. Price 5s.*

For the small sum of five shillings one can buy over five hundred pages of matter dealing in simple plain language, with the different problems of money and the financial system. Mr. Cole himself begins with a chapter on the definition, forms, and functions of money, and then in a second chapter proceeds to discuss the part played by money in the present World Crisis. Afterwards there are chapters by "nine economists from Oxford" dealing with Central Banking, Credit and Joint-stock Banking, Foreign Trade and Exchange Rates, Capital and Investment, Money and Prices, Public Finance, and International Debts. Finally Mr. Cole sets forth the case for the Socialist solution of Banking, and sums up the discussion in a concluding chapter.

The book might almost be described as a text-book if it were not for Mr. Cole's final chapter, since it is, generally speaking, non-contentious—that is, it deals with matters from an "orthodox" standpoint. That "heretics" exist is however admitted, and one chapter in the book is devoted to discussing the views of four of the leading "heretics," Major Douglas, Professor Soddy, Dr. Gesell, and Dr. Hobson. Since however the present economic structure is largely the result of "orthodox" economics, and since people are generally beginning to realize that something is wrong, it is questionable whether the non-contentious statements of the orthodox are not really extremely contentious. Take, for example,

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

...ring passage in the chapter on "Money and ..." by Mr. E. F. M. Durbin :

"We want to discover in this chapter what mone... policy ought to be pursued in the long run. ... the answer, in the broadest outline, is that the ... policy, whatever it may be, will maintain full ...yment. Beyond this contribution and no one ...deny that it is a very important contribution, ...r can do nothing to solve the real economic ...lem. The real economic problem is to raise the ...dard of living, to give people the things they ...ally want." (Page 314.)

Then he goes on to enumerate these wants as ..., clothing, houses, etc., and then proceeds to say ... in these days of machine production we are apt ...exaggerate the extent to which the problem of ...duction has been solved, and that even if all our ...chines, and men were fully employed the output ...consumption goods would only be increased about ...per cent.

Now practically every word of this is challenged ...the 'heretics.' To begin with, they deny that the ...ect of a monetary policy is, or should be, to ...tain full *employment*, since employment is not ...end in itself but merely a means to production ...l as has been frequently pointed out, few people ...e thought of what is going to happen when the ...ientists achieve their dream of being able to ...ness the rays of the sun to aid production, so that ...e or two men can do all the work that needs to ...done. When that occurs it would seem that the ...t of mankind would be expected to stand quietly ...de, and starve through Unemployment! It is ...portant then to realize this simple fact that the ...ect of an economic policy must be to obtain a full ...tput of goods; and in a machine age such an ...tput can be maintained *without* full employment. ...ll employment is impossiple, and payment (distri...tion) *should not be made conditional upon the ...formance of worth*. Then again, it is generally ...mitted that the world today is suffering from ...ver-production," and the problem is not to distribute ...cient but to distribute what is actually produced. ...w people seem to realize the fact that today a ...eat many things are created which cannot be ...nsumed, that is, which people cannot sell, because ...hers have not the money to buy. This is one ...ason why a war is good for trade, since both sides ...e busy presenting free gifts to their opponents, and ...erefore everything that is produced can be consumed, ...d so everyone is happy—except possibly the ...dinary soldiers! This does not mean that at present ...e are producing as much as we really need as ...y visit to an Indian village would show, but at ...esent production is being slowed down deliberately ...o try to equate itself to effective damand. Mr. ...erville Chamberlain, the present Chancellor of the ...chequer, put the matter clearly in a recent speech ...n the solution of the World Crisis.

"There is no method so certain and so rapid in ...s operation as the control of production, and the ...proper adaptation of supply to demand."

Mr. Durbin has estimated that there can be only ...20-25 per cent increase, but Lord Melchett in his ...book "Modern Money" has clearly shown that in ...some industries a 10 per cent increase in employment ...would result in a 50 per cent increase in production.

Again Mr. Cole in his chapter on money is ...equally questionable. He includes bank credits (created out of nothing) in his definition of money but he denies that cheques are money, though it is only in the form of cheques that the non-existent bank credit takes upon itself what he declares to be the function of money—that is to say, becomes available as purchasing power. Even more questionable is his statement that velocity of circulation compensates for deficiency in the quantity of money, because the given quantity of money can thus do more work in a given time. This is due to the "orthodox" habit of thinking in terms of money, instead of in terms of goods. In real terms it is the velocity of the exchange of goods that causes the money to circulate more rapidly, but even this does not mean very much. For example, if a person buys eight seers of *atta* at the beginning of the week his rupee circulates more rapidly than if he bought his daily supply each morning, but his cosumption of *atta* remains the same. No one can make a limited income buy more by spending it sooner. The "heretics" of course argue that money can cancel costs only once and it is the cancelling of costs that is important.

There is hardly room to deal with the "heretics" view point which has been referred to but roughly speaking the argument might be put as follows :

1. Before the Industrial Revolution people produced by using their physical powers to control the forces of nature. In those days what was produced was consumed, or exchanged by the producer for something that he wanted.

2. As a result of the Industrial Revolution people now produce by using *machines and their physical powers* to control the forces of nature. Therefore, what is now produced must be divided between the machine and the producer.

3. The machine itself does not consume and therefore the share which falls to the machine is used for producing more, and ever more machines which can produce but which cannot consume.

4. The machine displaces certain men, and since these men are displaced, and cannot work, therefore they cease to be able to buy, and therefore work has either to be created for them (i.e., luxury trades) or else the demand falls, due to decreased purchasing power, and production has therefore to be limited to a like extent! In short the position is similar to that of the python which began eating its own tail, and so tried to swallow itself.

The above is a very generalized statement, and so is very open to criticism but it will give readers who do not know any of the "heretical" views, some idea of their arguments which are that the economic system is at present based on money which is supposed to represent goods, and a true economic system would be based on the goods themselves.

CHRISTOPHER ACKROYD

TARIKH-I-ILAHI : *By Mr. V. S. Bendrey. Poona 1933.*

Mr. V. S. Bendrey, author of *Sadhana-chikitsa* (Marathi), and the editor of *Rajaram-charitram* (a contemporary account of Rajaram's famous journey to Jinji), has done a service to history by publishing in book form (pp. 46) his learned paper on the *Ilahi Era* of Akbar. Mr. Bendrey's study is a distinct advance on previous efforts to solve the difficulties

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

which beset the calculation of the true solar months and years of the Ilahi Era, and the conversion of the dates of this Era into those of the Christian Calender. He has for the first time utilized a valuable Sanskrit work, *Parsi Prakash*, written by one Vedangarai under the patronage of the Emperor Shah Jahan. The authors of the history of the Hindi Literature in Hindi (*Mishra-bandhu-binode*) mention Vedangarai as a *Hindi* poet in the court of Shah Jahan, who wrote *Parsi-prakas* about the year 1707 Samvat (pp. 502). Mr. Bendry who has examined three MSS. of *Parsi-prakas* of Vedangarai adds the following note on its author : "Vedangarai was a title given by Shah Jahan to one astrologer named Maljit, son of Tiggalbhatta, a resident of Shristhali in Gujarat—*vide* his son Nandikeshwar's account of his father rocorded in his book *Ganaka-mandanam*—a small treatise on astronomy. Vedangarai wrote this *Parsi-prakas* to explain the terms, technical words, etc., which may in the ordinary life, present a difficulty to an astrologer for want of sufficient knowledge of Persian. The work appears to have been written in 1549 A. D." (Note 13, p. 7.) We do not know whether the authors of *Mishra-bandhu-binode* came across any translation in Hindi verse of the *Parsi-prakas*, which seems to be doubtful.

However, it must be admitted that *Parsi-prakas* of Vedangarai was the first attempt to solve the difficulty of accurately calculating the dates of the Ilahi Era. Mr. Bendrey has given in an appendix some valuable extracts from this book. We recommend the use of *Tarikh-i-Ilahi* to students of history for checking the conversion of dates in the English translation of Abul-Fazl's *Akbarnama* by H. Beveridge.

K. R. QANUNGO

THE TWO INDIAS : *By B. P. Beotra, B.A., R.S., Chief Secretary, Suket State. Pp. 124.*

This is a handy little compendium of treaties concluded from time to time between what are now known as the political halves of India, *viz.*, the British Power and the States. The principal drawback of the work is that it does not attempt to reason out the justice or otherwise of the policy which led to those engagements or to trace the circumstances under which the political situation of India came to be developed. But the mere enumeration of facts and dates contained in this sketchy volume is in itself a great help at the present moment when the future constitution of India with the States as federal units is being forged. It amply proves that England subjugated India by diplomacy and not by the force of arms. It also brings out prominently how even the most solemn engagements and permanent bindings were quickly set aside as soon as the exigencies of the situation required a change. One realizes how futile is the claim so often put forth that the privilegs, rights and dignities of the Indian Princes would always be maintained unimpaired. In politics as in other mundane affaris of this world there is nothing permanent or fixed. The volume contains here and there inaccuracies of dates and circumstances, which however do not mar its value, as it does not profess to offer any historical treatment.

G. S. SARDESAI

THE CHILD IN THE MIDST: *by L. Wi... Bryce, M. A., with a Foreword by Lady Abdul Qa... published by Y. M. C. A. Publishing House, 5, Ra... Street, Calcutta, pp vi+136, price cloth bound Rs. ... paper bound Rs. 1-8.*

The book under review is a praiseworthy att... to guide the parents in the numerous problems t... confront them in the task of training up child... Almost all the problems have been mentioned ... practical advice based on facts of child psych... has been given in plain and simple language. It ... almost become a truism now that unless the ... train themselves, it is hopeless to expect that ... would be able to train their offsprings. SANSKRIT

GHERANDA SAMHITA :

The Review of Gheranda Samhita at pages 82-83 of the Modern Review for January, 1934, needs correction in one or two particulars.

Between 1895 when the work was first published, and 1933, the year of its reprint by the T. P. H. Adyar, Madras, there have been two more editions of the work. It was included in volume XV of the Sacred Books of the Hindus along with An Easy Introduction to Yoga Philosophy and Siva Samhita (both text and translation) by the same learned author and practical Yogi. A second edition of the volume was brought out in 1925. For these publications the thanks of scholars and the general public are due to the Panini Office, Allahabad,—that original and enterprising publishing house which has to its credit the publication of so many of the ancient scriptures of the Hindus and of several other valuable and indispensable works of linguistic, historical, economic and educational importance. The Panini Office has also published the text and translation of Hathayoga-pradipika directly to popularize the original Yoga texts.

The learned reviewer again sets it down as the definite conclusion of Mr. Vasu that Gheranda was a "Vaisnava of Bengal." This is misleading. Mr. Vasu's exact words are: "The directions regarding food are peculiar for the people of Bengal, the author of this treatise being apparently a Vaisnava of Bengal."

BENGALI

BANGIYA NATYASALAR ITIHAS: (*Sahitya Parishat Series No. 83*). *By Brajendra Nath Banerji. With a Foreword by Dr. Susil Kumar De, M. A., D. Litt. Bangiya Sahitya Parishat, 243-1, Upper Circular Road, Calcutta. Price Re. 1-4 for members and Re. 1-8 for others. B. S. 1340.*

The book gives the history of the Bengali stage as adapted to the European stage and covers a period of about one hundred years (1795-1876). It is divided into two parts. The first part in seven chapters deals with a period when public theatres had not developed and amateur parties busied themselves in supplying amusements to selected invited guests and creating their own pleasure. The second part in five chapters furnishes a history of the public theatre up to the passing of the Dramatic Performances Control Bill into an Act in the beginning of 1876. There are two useful appendices at the end of the book—one (which is highly important) giving a chronological list of the dramas staged on the boards of different public theatres; the second giving a list of the works of the early and well-known playwrights of Bengal. The account given in the book is primarily based on reports contained in contemporary newspapers, the results of a thorough ransack of which have already been published by Mr. Banerji in the form of extracts from them arranged under various heads. The account is therefore more accurate than some of the similar other accounts based on heresays and reminiscences. It is only to be hoped that Mr. Banerji will be able in future to discover from old records some accounts of the Pre-European stage in Bengal and thus supply us with a missing link between the Sanskrit theatre and the modern Bengali theatre.

CHINTAHARAN CHAKRAVARTI

MARATHI

लाला लाजपत राय (*The Life of Lala Lajpat Rai or the commencement of the new era.*) *Price Rs. 2. Pages 296.*

The author has dealt with the life, work and sacrifices of the hero critically. The history of the Indian national idea is described in this book and it is very thoughtful and appreciable. The book would have been very useful had it contained Lalaji's original thoughts.

सह्याद्रीच्या पायथ्याशी (*At the foot of the mountain Sahya.*) *Price Re. 1. Pages 150.*

The author Mr. Sukhatanakar has published this collection of eight stories of realists, which delights in provincial details and local colouring. Almost all the stories take their life, colour and language from Goa and as such they are the best representation of Goanese culture.

शिक्षणविषयक नवे विचार (*Modern thoughts on Education.*) *Editor Mr. B. D. Karve. Price Rs. 3. Pages 273.*

This book contains an account of the lectures delivered by experienced educationists like Prof. V. M. Joshi. It is divided into six parts. The whole field of education is traversed by instructive lectures in these six parts. This is a unique publication dealing with educational problems.

V. S. WAKASKAR

GUJARATI

KALAPI CHITRADARSHAN: *Published by Chandrakant Brothers, Bombay. 1933.*

The eleventh session of the Gujarati Sahitya Parishat was held, during the Christmas holidays (1933) at Lathi in Kathiawad. Lathi has been immortalized in Gujarati literature as the place where the Prince-Poet Surshinji, whose *nom de plume* was Kalapi, reigned and wrote his poems. Taking advantage of this event, the publishers have brought out this sumptuous volume of Kalapi Album, containing excellent illustrations of the life and life-work of the poet, both of them being romantic in so far as he married his wife's maid-servant, and made her the Queen of his Heart. It contains 30 photos from life, 15 pictures depicting Kalapi's poems and scenes from those poems, 6 illustrations of places of interest connected with him, an appendix containing the letters of the Prince to his wife and friends, and an introduction in English from the pen of the well-known writer, Kanaiyalal Munshi. The get-up of the work is excellent from an artistic point of view, and the publication furnishes a landmark in Gujarati literature in this direction.

KATHIAWAD MAN SARVABHOWM SATTA AND GAEKWAD MAJMUDAR: *By Nayansukhrai Vinodrai Majmudar. B. A., LL. B., of Amreli. Printed at the Arunodaya Press, Amreli. Thick card-board. Pp. 464. Price Rs. 2. 1933.*

The writer of this book,—a sort of family history of the Majmudars who served the Gaekwads principally

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

in Kathiawad during the period of the Maratha sovereignty in that province, belongs to the family of that great Bhakta poet of Junagadh, Narsinh Mehta. The book is replete with first-hand information about those ancestors of the compiler, who in various capacities, as fighters and as administrators, contributed their share in the bringing about of orderliness out of the chaos that reigned there in those stirring times, between Samvat years 1780 and 1890. The narrative comes as far as Samvat year 1941. Every statement is supported by documentary evidence which is interesting from a historical point of view. Besides being State servants the writer forbears even great Vaishnav Bhaktas and poets. Altogether the book is sure to prove helpful as shedding some light in the later history of the province.

NARSAYYO BHAKTA HARINO : *By Kanaiyalal M. Munshi, B. A., LL. B. Advocate, Bombay; printed at the Khadayla Printing Press, Ahmedabad. Illustrated. Cloth bound. Pp. 114. Price Re. 1-8. 1933.*

Narsinh Mehta known generally as the Adi-kavi of Gujarat has, of late, assumed prominence, once again, by certain questions raised as to the exact year of his birth. The subject has been named the Riddle of Narsinh Mehta, and several Gujarati scholars have tried their hands at solving it, one of them being the writer of this dissertation, Mr. Munshi. The controversy is still raging, and hence it is difficult to [illegible] anything definitely one way or the other. Mr. Munshi places it between Samvat years 1530 and 1580, not earlier than 1530 and not later than 15[illegible] The generally received year is Samvat year 14[illegible] Besides this controversy, another one has attached itself to the poet; it is this: whether the celebrated work called Harmata is written by Premanand or Narsinh: On a consideration of various reasons, Mr. Munshi comes to the conclusion that it cannot be the work of the latter: he also says that he is prepared to revise his opinion on getting additional material. In later chapters he has tried to spell the life of Narsinh out of his verses, that is, he reads into some of them the narration of incidents and events in his own life as set out by the poet, a piece of autobiography. It is an interesting piecing together of isolated fragments, and reads like a rhapsody composed under the influence of the enforced rest enjoyed (?) by him in the Bijapur jail. The work bears the stamp of the impetus or impulse of the dynamic personality of the writer. The illustrations are based on imagination.

K. M. J.

RUSSIA TODAY: CHILDREN'S HOMES, PALACES, AND SEXUAL RELATIONS

By NITYA NARAYAN BANERJEE

IN the playing room of the Children's Home which I visited there was a big piano to the accompaniment of which the grown-up children sing and dance and thereby have their daily exercise. There are toys—everything materialistic—aeroplane, ship, torpedo, pump, engine, soldier, not a bogey or a fairy; they do not celebrate the marriage ceremony of daughters and sons, as children in Bengal do, or worship dolls of mythological gods and goddesses. Every boy is given the chance to play with anything, and it is noticed what play he likes. If he likes painting, in his future studies he is encouraged on that line; if he shows a tendency towards engineering, the army, agriculture, art, he is given all facilities to develop on those lines. From their very childhood Russian children are observed and regular records about them are kept. They are not pressed in the same mould—the dictators of Russia realize that there are different materials in different individuals and they should not be moulded in the same press.

According to age children are classified and taken care of. In one room about thirty babies were sleeping—the attending nurse was preparing her report of all the children under her care. She has to note daily the temperature, the stool and urine, times it cries and such other technical points. Every baby is given individual attention, every one sleeping with hands up, the scientific position. If anything is wrong with any child it is segregated and sent to the doctor—his mother may not take her child home, but if necessary she may stay there. Probably the richest man of our country would envy the scientific and hygienic care taken of and attention given to the Russian workers' children. Finishing my visit, I was requested to put down

A painting in Hermitage—Leningrad

opinion in a visitors' book which I did very gladly.

The Intourist sent the taxi and it was ready at the door. We drove out to see the whole city.

Soon we came beside the Neeva river. Its dancing sparkling waves were frozen white, as if under the spell of some magician's wand; a vast sheet of wavy snow stretched between the wide banks. We came across many important buildings, among which mention may be made of College and Office of Navy; Bureau of Labour on the bank of the Neeva, where formerly political prisoners were imprisoned and tortured; the first Residence of the Central Committee of the Communist party, formerly the private residence of Kshesinskaya, from the balcony of which Lenin after his return from foreign lands, where he was exiled, made his first public speech before thousands of his followers; the Red Army Arch, a colossal yellow-coloured building made by the famous architect Rossi in 1819-25, which was and still is the seat of the army, just in front of the well-known winter palace of the Tsar, which has now been converted into the Museum of the Revolution. Beside this huge ornamental building is the world-famous Hermitage, the favourite picture gallery of Tsarist times which was built by Gerard Terborch in 1617-81 and which still contains beautiful original paintings by well-known Italian aud French artists. The palaces of the Tsar's sons, daughters and relations are worth seeing. Before one such building, "Panti Palace," is a nice park having the sickle and hammer, the emblem of the Communists on its bed. In this park, not very far from the Tsar's palace, thousands of revolutionaries died. So it has been named "Square of the Victims of Revolution."

After visiting the important buildings and parks in the city, we took a long drive to the outskirt of the city, where the summer palace of the Tsar stands. This beautiful three-storied building stands the same as it used to do in the Tsar's time; the pieces of furniture are kept as they were, just to show the people how lavishly the king used to spend at the cost of the poor people's labour. It was

Red Army Arch and the office of the Army —Leningrad

already too late for lunch. We came back to the hotel in the afternoon and, finishing lunch as soon as possible, went to see a "zag" or marriage and divorce registration office. This was on the second floor of a huge building, a small office having two clerks and several benches for the couples. We were given a seat near the Registrar's table; the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

guide interpreted to me the questions and answers of the registrar and the couples.

The willing couple have to deposit only two roubles in the office in the morning, for which they get a number. During the registration hour the registrar calls out the number serially and the couples come before her, produce their passports, which according to the new Russian law everybody has to obtain from the local police as proof of identity. The registrar takes down the names of the bride and groom in her book and the couple are requested to put their signatures in the book. That finishes everything—they are married. The only questions they are asked are, if that was the second marriage of any of the party and their age. Couple after couple

Park of Victims of Revolution (Paul's Palace) —Leningrad

came and got married; there was no ceremony, no priest, no friend or bride's maid on the occasions. Probably it takes five minutes to be married in Russia and much less time to be divorced. Any one of the couple may come to the office and say, "I want to be divorced." That is enough to get a divorce. If the other party be present, so much the better; if not, he will get a post card from this office that he is no longer married, his partner has divorced him, and he will be requested to have his passport endorsed to that effect. The registrar will not ask, why they are divorcing, would not disallow a prayer for divorce for want of any proof about adultery. She may request them to settle the differences, but even that the law does not require. I was shown the books in which notes on marriage and divorce are kept, but could hardly understand anything. Pages of both the book were almost full. I asked the registra "What is the percentage of divorce?" S said, "About fifty per cent."

"So much," exclaimed I.

"But that is a smaller percentage in com parison with America," added my guide.

An eager couple came and asked something which I could not understand. M guide answered him and smilingly said me, "He asked our number." It was amusing

I asked, "What did you tell him?"

"Numberless," was her reply.

A young couple took their seat before th registrar. They seemed to me quite young just about eighteen, the marriageable age Russia. Another couple came who seem quite aged. Both of them were marryi for the second time. So they were aske if they had any children. The answe was in the negative. If there be any childre by the first marriage, parents have maintain them, but, unlike other countrie the burden of maintenance is not only the father; if the father does not care the mother has to bear the burden of maintenance. The amount of alimony varies accord ing to the earnings of the parents, but if ei party is totally incapable of earning, he m claim one-third of the other's earnings. a rule, in case of divorce, the children st with the mother, but if she ill-treats them is a drunkard or moral reprobate, the fath may claim the children. Whenever there a divorce, the parents try to come to mutual settlement regarding children and th maintenance; if they fail to do so, they ha to go to court. Registration of marriage not absolutely necessary by law in Russ If a male and a female so like, they can li together as husband and wife, neither the sta nor society will condemn it. But this fr mating sometimes causes much trouble wh there is litigation for alimony. In suc difficulties fathership is determined on t evidence of friends and relatives. If they s that the man used to live with her and m probably the son is his, he has to pay for h maintenance. This may be one of the ch reasons why Russia in spite of so much laxity relations between the two sexes has not turn into a land of debauchery. When one hea

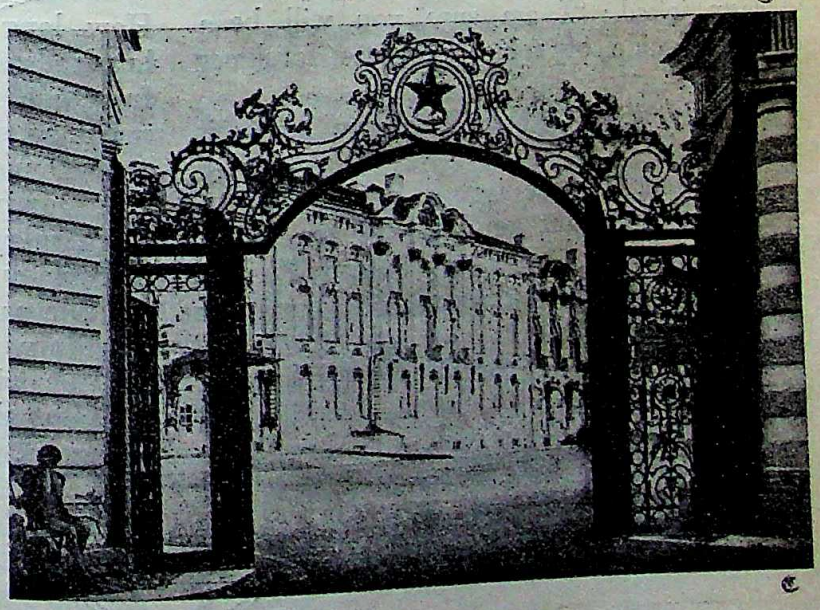
Tverskava-Yamskaya Road : one of the main streets—Leningrad

that in Russia male and female can live together without any restriction, he naturally thinks the females in Russia are so many prostitutes and males are debauches of the lowest grade. But in fact it is far from so. To me it seemed the Russians were much more moral than other nations of the continent. What do we see in Europe? In all civilized countries women dress themselves in such a fashion as will readily attract the attention of men; in society dinner and dances both men and women try to make themselves prominent, not among themselves, but before the eyes of the other sex; but in Russia this sex suggestiveness is totally absent. Men and women travel together in the same compartment of the train in day and night, they have their sunbath in summer on the river banks side by side with scanty bathing costume or with nothing on at all; in processions male and female march side by side without the slightest sex sensibility. Seduction is a great offence in Russia—to Russians it is exploitation of sex. One must be true and sincere in his love life. One may divorce and get married at his will; but if it be proved that it is his nature to do so, he is sentenced to imprisonment. Amongst the youths of the universities and colleges sex life should be more complex. The male and female students eat, sit, sing together, live in the same dormitory, though in separate rooms. But they can go to each other's room, may fall in love, even mate and have children. Neither the authorities nor the fellow-students will frown on it. If two students want to live a married life, registered or not, they are allowed to do so. If they have a child, the mother may still proceed with her studies, leaving the child in University nurseries. But if it is proved, that any student, male or female, enjoys sexual life casually, where there is really no love but the desire of satisfaction stands prominent, he is disciplined and reprimanded. Love has got all licence but seductiveness is banned. If anybody infects his mate with any venereal disease, even if they be husband and wife, he is punished with one year's imprisonment.



Summer Palace of Tsar—Leningrad

An old woman came to assist the registrar as she could not cope with the heavy work. We were sitting just beside the table and probably looking to be a couple. The old woman gravely asked: "Yes, your number please?"

The Primrose drawing-room at Summer Palace

My guide burst into laughter this time and interpreted to me her question. The registrar, too, began to laugh and explained to her assistant that we were mere visitors. The old lady joked: "I am sure you will be a permanent guide of some fortunate foreigner one day."

My guide said: "Why one day, make it today."

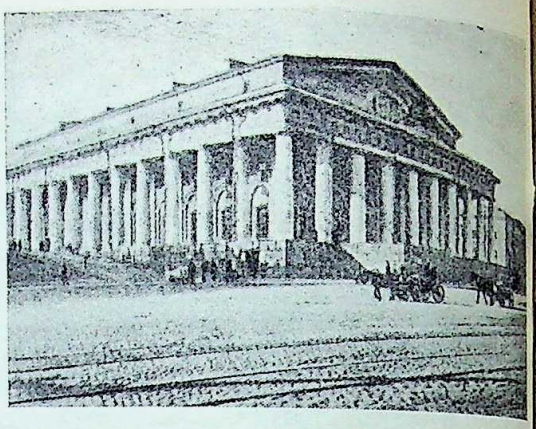
I objected, "But we have no number."

The old assistant replied, "Never mind. We can number you right now. Ready ?"

I said, "I am yellow coloured, so your white friend will not agree."

My laughing guide exclaimed: "If I agree, are you ready ?"

This time I was cornered. The registrar



Bureau of Labour
Formerly the Prison for Political Prisoners
—Leningrad

intervened and said, "Last year I married an Indian with a Russian girl."

I murmurred: "But I am already married."

My guide burst into surprise: "Are you really ?"

We came out into the streets but my guide would not let me stop about my marriage. She showered questions after questions. "How many years ago were you married ?—What is your wife's age ? Is she beautiful ? How long did your courtship last ?" and a hundred more such other questions. Hearing from me that we have no courtship before marriage, she gasped with surprise.

"How do you marry then ?"

"Our parents choose the bride—"

"And you marry ?" Her eyes were about to come out in surprise.

She paused. "It is shocking to imagine how do you do so ?"

"That is our custom—"

"But that's a rotten custom, you should change it. Should'nt you ?"

THE INDIAN RESERVE BANK

Its Powers and Responsibilities

By H. SINHA, Ph. D.

THE present monetary organization of India loudly calls for reform. In the first place, credit and currency are unrelated. Government have the sole rights of the issue of notes and of rupees, which, although tokens, are unlimited legal tender. Credit, again, is controlled or sought to be controlled by two separate agencies,—the modern joint-stock banks and the old indigenous bankers without much cohesion between them. In the second place, banking is very imperfectly developed. Cheques are practically unknown except in big cities and ports. Branches of banks are few and far between. In the third place, a vast agricultural country like India must necessarily present credit problems, which are difficult to be solved even with a highly organized banking system. At the time of each harvest, whether of jute, cotton or rice, considerable funds have to be moved from the ports to the remote growing regions to pay for the crops raised there by the cultivators. Thus there is a temporary shortage of legal tender and therefore of credit in the banks in the big cities and ports. The cultivators cannot, of course, keep the money with them for any length of time. They have to pay rent; they have to repay their debts; they have to purchase those necessaries of life, which they do not produce themselves. The money thus released comes back to headquarters in driblets and the process is unduly long. In the meantime, the exporters of crops present their bills drawn on their buyers abroad for discounting. Thus the banks with their depleted cash resources are called upon to meet an increased demand for credit. It is no wonder, therefore, that there are all the possibilities of a serious crisis every year,—or rather several times every year. The seasonal fluctuations noticed in small manufacturing countries with highly organized banking system are mere ripples compared with the seasonal waves found in India.* There are other problems, such as the vagaries of the monsoon and the "hoarding" habit of the people which further complicate the situation. The Indian Reserve Bank should assume unitary control of credit and currency and alleviate all these evils as far as possible "through suitable contraction and suitable expansion . . . aiming generally at stability."*

This of course is admitted on all hands. But it is not always made clear what is meant by suitable contraction and suitable expansion. We may however hold that the amplitude not only of seasonal swings but also of trade cycles should be narrowed down as far as possible, with a view to stability.

Now, what exactly does this stability mean? Does it mean, as it certainly did in pre-war days, stability in exchange? Or does it mean stability in the general purchasing power of money? Or, again, does it mean stability in the general economic activity of the country? The last has all my theoretical sympathies. Our aim should be to keep production going and maintain the volume of the output. But let us analyse the practical implications. To start with, it is a very wide term, embracing as it does, not only production of goods, but also services of various kinds, making up in the aggregate, the entire national income. To compile a satisfactory index for this is extremely difficult, the new "Economist" index of business activity notwithstanding. There are some, who would seek to represent it by just a few measures,—possibly by only one,—by the consumption of lubricating oil for instance. On the other hand, there are some, who would try to find out a satisfactory index for each separate item of economic activity, whether direct or indirect, and weigh each such separate index according to its importance in national economy,—in other words, by its net output as determined by census of production. I am not competent to speak about this country,

* See *Bankers' Magazine*, London, for October, 1924.

* See Mr. Montague Norman's evidence before the Hilton Young Commission.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

but I am sure it will be impossible to compute such an index for the whole of India including Burma, which, possibly separate constitutionally, will be financially a unit of India. Even if it is compiled, it will have hardly any statistical significance. For, unless there are a number of groups of about equal importance, accounting for a predominant proportion of the whole economic activity, the average must be merely an arithmetic abstraction.

If the aim of the Indian Reserve Bank is stability in the general purchasing power of money—I am not talking about the present time or even the immediate future, when conditions all the world over remain abnormal, —even if we take a distant view, the position is not without difficulty. The agriculturists, who form the bulk of the population, have different standards of living as revealed by village economic surveys during several years past. In some parts of India, again, money economy has not fully penetrated even now. In Bengal, for instance, "paddy loans," that is, loans incurred and repaid in terms of unhusked rice, are not infrequent and have proved a blessing in disguise during the recent fall in the price of crops. Even in the case of urban wage-earners, where there should be better standardization, there is a wide disparity in the cost of living in different parts of India, and even in the same part of India for different communities. The four index numbers published for the four communities of Rangoon work-people offer an interesting study in themselves, baffling all attempts at a satisfactory common figure of cost of living for that city alone.

Thus we are left with stability in exchange as the chief objective of the Indian Reserve Bank,—in terms of sterling for the present and of a world standard, not necessarily a gold standard, when such a standard is set up by common consent, when all agree "to play the rules of the game." This calls for two sets of considerations, (*a*) adequacy of reserves and (*b*) adequacy of control. The latter is, of course, the chief problem, for if that can be satisfactorily solved, a small reserve will be sufficient. I must confess I do not sometimes understand what is meant by "adequate reserves." I am not unmindful of what has been said about this in the White Paper on Indian Constitutional Reforms as a necessary preliminary to the establishment of the Reserve Bank. Possibly, one will be called a theoretical visionary, when one points out that when all the central banks move in unison there is no limit to the volume of credit which can be made available for each by the Bank for International Settlements, properly reconstituted for the purpose. But, surely, one may adopt some better criterion for judging the adequacy of reserves than the standard set by other central banks, on historical, social and political, but not certainly rational grounds. May we not consider it from the point of view of the maximum adverse balance of payment, leaving sufficient margin for factors unknown, possibly unknowable? On that criterion, India may regard herself as perfectly safe, her present volume of short-term debt notwithstanding. I do not forget that she is a debtor country; that her exports consist of a few commodities exposed to world competition; that her market has been narrowed down, specially after the Ottawa pact, which has secured confidence for the present but may impose undue restrictions in the future. I do not base my optimism on jute being a monopoly, for I recognize that being largely a packing material it must feel the first brunt of depression and must remain moribund so long as world trade remains moribund. I have in mind the vast manpower and the almost unlimited resources which India possesses, and which, properly employed, may form the basis of any credit she may require.

This brings me to the question of the adequacy of control secured by the Indian Reserve Bank over the Indian money market which is thus the essence of the matter. The Reserve Bank will, of course, have the sole rights of note issue, of the output and issue of legal tender currency, of the holding of Government and bankers' balances, and of the management of all financial operations on behalf of Government. In view of the primitive monetary system,—if you prefer, the lack of system, in India, it is doubtful even if these valuable privileges will be able to secure sufficient control for the Indian Reserve Bank at least for some time to come.

In moving the Reserve Bank Bill in

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Indian legislature on 27th November last, the Hon'ble Sir George Schuster stated that over 90 p. c. of Indian banking was in the hands of indigenous bankers, who had no effective contact with the organized banking system. They have been sought to be attracted by the offer of the same privileges as the modern "scheduled" banks, *viz.*, remittance and rediscount facilities and the protection afforded by the Bankers' Books Evidence Act. The latter is of no practical importance, for the indigenous banker has no books requiring protection. If remittance can be made as cheap in India as in other countries* he may find it worth his while to be associated with the Reserve Bank. It may be recalled in this connection that the first rudimentary central banking of a sort started by Warren Hastings as early as 1773 but wrecked in 1775 chiefly owing to the unworthy jealousy between him and Francis was almost wholly concerned with remittance operations on behalf of the East India Company through the branches and correspondents of the "general bank."† Apart from this, to the extent remittance charges are reduced, there will be a better utilization of the monetary resources of India and a corresponding lowering of the interest rate.

The chief inducement that can be offered to the indigenous banker for joining the organized banking system is easy rediscount facilities. Again, through these alone, can the Reserve Bank make its influence felt as "the lender of last resort." Unfortunately, there is no bill market worth the name in India at present. Most of the external trade is carried on with sterling bills, for they ensure low interest rates and adequate discount facilities. This cannot be altered until the Indian money market is equally well organized. As regards internal trade, it is carried on through cash credits and not by bills. It is not merely the high stamp duty, nor even the multiplicity of vernaculars, which stand in the way; it is appalling illiteracy of the country as a whole, which is on the increase as revealed by the last census.

It may be urged that there are two important Stock Exchanges in India, one in Calcutta and the other in Bombay, where the Reserve Bank may have open market operations. It is doubtful, however, whether they are wide enough for the large scale operations, called for by the extreme seasonal swings of a vast agricultural country with a rudimentary banking organization like India. Apart from this, the central bank of the future must be prepared to buy and sell long-term securities freely to manipulate the long-term rate of interest. I do not agree with the orthodox view that the short-term rate and the short-term investment alone are the concerns of the central bank. In spite of the present low rate prevailing in the short money market, the yield on British securities is about 3½ per cent which is unduly high compared with the pre-war rate, specially when we take into account the considerable increase in the supply of capital since then. The central bank of the future will have to follow a much more active policy for open market operations than now.

I know there is a disposition in India possibly in Canada, too, to hope for a new heaven and a new earth as a result of the establishment of a central bank. But there should be no such illusion. The banking system of all countries, including India and Canada, is largely the reflex of historical, social and geographical conditions ruling in those countries and cannot be changed until those conditions are changed. In India the only immediate improvement will probably be the issue of additional currency at the beginning of the busy season without there being a prior raising of the interest rate. But this should not, on the other hand, blind us to the fact that "there is no influence so potent in the way of developing the credit system on sound and progressive lines as a well-founded central bank"—a dictum first enunciated by Sir Cecil Kisch and now reinforced by the Canadian Banking Commission.*

* The foreign experts pointed out to the Indian Central Banking Inquiry Committee that remittance was generally free for places within 300 miles of each other in Canada; in Java, the charge was one guilder for mail transfers of one thousand guilders or under, irrespective of the amount. (See Vol. IV, above, pp. 668 *et seq.*)

THE FOURTH CENTENARY OF CORREGGIO

By SUBRATA KUMAR CHAUDHURI

THE great Italian Renaissance, uncheked and original in its genesis, had nearly spent up all its creative energy and was now approaching an abrupt termination. The two masters of the past generation —Leonardo and Raphael—were already dead; the giant Michelangelo, though destined to live many years still and contribute his quota to the world of art and culture, had finished the marvels of his workmanship in the Sistine Chapel. It was evident that the current was moving farther and farther away to the remote side of the Alps, to Germany, France and the British Isles. During this northward march the eddy passed over the districts of Venezia and Lombardy and their neighbourhoods, where the new seeds flowered into several world renowned geniuses of whom Correggio was decidedly one of the greatest.

Antonio Allegri da Correggio, a native of the district of Modenna, was born in the town of Correggio in 1494. A pupil of Francesco Bianchi (better known as Ferrari) he thoroughly learnt his art at a very early age and proved to be one of the most precocious talents ever seen on earth. Soon he developed the strange faculty of assimilating the styles of the famous masters, now plagiarizing from da Vinci, now stealing from Mantegna, though "making all he took into a thing of his very own. Raphael and the Umbrians gave him decorative grace, Francia sweetness of temperament, and from Michelangelo himself came power of modelling and mastery of bold dramatic light and shade." * Then discovering for himself the line that would suit him most, he began his career as a decorator of the interiors of the Churches of Parma where he was called in 1518.

In his twenty-sixth year Correggio married a young and pretty damsel, Gioralama by name, who sat for him as a model in his celebrated Zingarella or the Gipsy Girl. Before that he had exhibited the highest charm and sweetest grace of his style on the walls of the Nunnery of Paolo in Parma. He now undertook to paint the altar-apse and then the interior of the dome of S. Giovanni. But, as in the works of his compeers Raphael and Michelangelo, "the illusion creating and architecture destroying" qualities, characteristic of the virtuosos of the Renaissance appear everywhere, though it cannot be denied that here a better compromise between mural painting and architecture was sought out by him. The subject is the Ascension of Christ sometimes called The Descent from the Cross, and a sweet melancholy envelops the whole theme. His next attempt was the presentation of the 'Assumption of the Virgin' on the cupola of the cathedral of Parma, "where he went at once to the extreme of what can be adventured in foreshortening, even forestalling in this attempt the mighties genius of an older generation—the Last Judgment of Michelangelo, for instance, not having been begun earlier than 1533."*

What strikes one most in these specimens of artistic creation is his mastery of colour. "It may at least be held certain," writes Vasari in his *chef-d'œuvre*, "that no one ever handled colours better than he, that no craftsman ever painted with greater delicacy or more relief, such was the softness of his flesh painting, and such the grace of his work." † One other quality that attracts the sight of even a casual observer is his wonderful power of chiaroscuro. "His peculiar means of expression" writes Lubke, "is light which softly blended with the twilight and interwoven with delicate reflections and transparent shadows, played around his figures in a kind of coloured chiaroscuro. In producing this chiaroscuro, with its minute gradations and shadings, Correggio is one

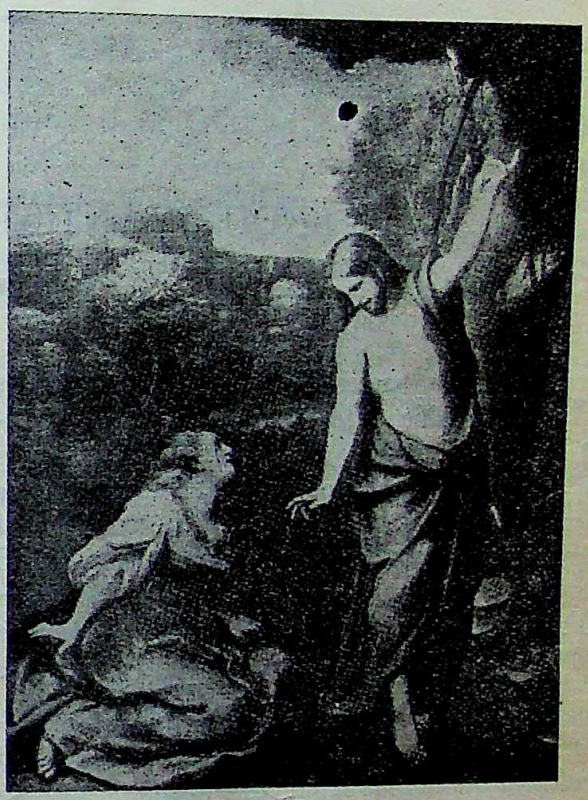
the masters of painting." * The reader may be referred to his La Notte (Night) and Il Giorno (Day), the former representing the Adoration of the Shepherds and the latter Madonna and Child with Magdalene and St. Jerome, the two contrasting pictures of the most finished perfection as illustrations of the foregone quotations.

Essentially an artist of 'movement,' Correggio exhibits a paroxysm of ecstasy in his paintings. A joyous delight, expressive of a superabundance of emotion envelops the figures he created. Sorrow and grief are completely left out, for, as Kaines Smith writes "the one thing none of them (his predecessors and contemporaries) could teach him was sorrow." The Zingarella has been mentioned before. The 'Magdalene lying in terra,' whose authenticity was questioned in the last century but since re-established by Corrado Ricci in his life of Correggio, is illustrative of lavish display of expression and excitement. An over-emphasis on such passionate feelings sometimes spoils 'the dignity, gravity or nobility of his form,' but his justification lies in the fact that 'he does not demean his saintly personages when he portrays them alive to these emotions ; he transports them all back into the state of paradisic innocence,'† as is seen in his Madonna della Scala or Madonna della Scodella.

Space does not permit me to introduce here the rest of his achievements, nor does this article purpose to give a detailed critical appreciation of the genius. I can only enumerate some of his most important productions where an exceptional quality of the artist is remarkable. Coming from the brushes of the earliest and greatest exponent of feminine loveliness and one expert in the representation of the softness of the human flesh as well as the rhythm of its delicate contour a few of these works require some special consideration. The Leda with the Swan at her breast in the accompaniment of a bevy of bathing comrades, the Io embraced by the King of the Clouds, the Antiope where Jupiter is surreptitiously removing the robe of the sleeping beauty and the Danae spreading her dress to receive the gift from the god of gods are all pregnant with an overflow of movement. The splendour transcends the elements of sensuality and voluptuousness while an extravagant display of the essential feminine charm fascinates all the more the mind of an admiring observer. The Education of Cupid by Mercury in presence of Venus, probably



Noli me tengere (*Prado.*) Madrid.
By Correggio

the most popular of his paintings, shows Correggio at the height of his talent and is another example of his delicate toning of their bare limbs "gleaming softly in their silvery light and existing only for beauty and for joy of being alive."

Though working slowly in his isolated nook out of touch with the other masters of Italy, Correggio could not escape the effects of the great artistic transition on whose borderland he stood. The change from the style known as the High-Renaissance to that termed Beroque, in which a single predominant motive stands conspicuous to which all the others are subordinated, first visible in the architecture and plastic art of Michelangelo,* appeared

in his later works. A greater freedom and irregularity succeeded the equipoise and regularity of the old times; this was undoubtedly a decline and Correggio shares it along with his contemporaries. Moreover, "he was sensuous and therefore limited; and the highest virtues are derived from the perfect harmony of sense and intellect, such a harmony as since the most noble days of Greece has never again appeared in perfection, not even in Giorgione and Raphael."*

Correggio died on the 5th March, 1534, at the early age of forty.

HINDU SCIENTISTS ON EARTHQUAKE

By K. P. JAYASWAL

HINDU scientific literature treats specifically of the subject of earthquake. I am giving below the conclusions of Hindu scientists on the phenomenon of earthquake from the writings of astronomers and mathematicians who flourished in this country before 600 A.D. Varaha Mihira wrote his encyclopædia—*Brihat Samhita*—before 587 A.D., which is the year of his death. Dr. Utpala (भट्टोत्पल), the commentator of Varaha Mihira, has cited *verbatim* quotations from the original authors drawn upon by Varaha Mihira. I am utilizing these sources for my notice below.

In chapter xxxii of his encyclopædia Varaha Mihira deals with "the subject of *Bhukampa* (earthquake)," as an independent topic, although references to earthquake are to be found in very many other places in the book.

Causes of Earthquake

On the causes of earthquake, apart from two Puranic theories, there are these theories of the scientists.

(i) *Atmospheric Pressure*: the upper atmosphere comes into friction with the lower atmosphere of the Earth which causes an earthquake with a roar.

"अनिलोऽनिलेन निहत: क्षितौ पतन् सस्वनं करोत्यन्ये"
[xxxii, 2.]

The author of this theory was Vasishtha, whose original text is as follows:

"यदा तु बलवानवायुरन्तरिक्षाऽनिलाहत:
पतत्याशु सनिर्घातो भवेदनिलसम्भव:
तस्य योगान्निपततश्चलत्यान्याहता क्षिति:
सोऽभिघातसमुत्थ: स्यात् सनिर्घातमहीचल:"
—Bhattotpala, p. 442, Ed. Sudhakara Dvivedin.

(ii) The theory of Parasara was entirely different. According to him *earthquakes are produced by gravitation of planets*, when there is a disturbance in their regular courses.

"अर्क-चन्द्र-ग्रहण-ग्रह-विकृतचारजांश्च कम्पानाहु:"

(iii) In addition to the above all the authorities are unanimous in holding that one class of earthquakes is caused by the Elemental Fire.

(iv) Another class is unanimously stated to be the result of heavy rains, and

(v) the last class to be the result of internal or elemental water.

Four Classes of Earthquakes

Earthquakes are thus divided by the Hindu scientists into four classes.

(i) *Vayavya* or atmospheric. This is produced, according to the school of Parasara, by the gravitation of planets, while according to the others, by the concussion of the upper and lower air. This is the most dangerous type of earthquakes, which is evident from its duration and extent and the mischief, which I shall presently notice.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

(ii). The *Hautasa* (हौताश) or *Agneya* (आग्नेय), *i.e.*, quakes produced by the internal fire. This is the second dangerous type.

(iii) & (iv) The third and the fourth are the *Aindra* and the *Varuna*, which are produced by excessive rains and floods. The last one is regarded at times as beneficial (*subha*) while the others are of the destructive type (*asubha*).

The First Type

The *Vayavya* occurs under seven named *nakshatras*.

चत्वार्यर्यम्णाद्यान्यादित्यं मृगशिरोश्वयुक् चेति
मण्डलमेतद्वायव्यमस्य रूपाणि सप्ताहात् ।
[XXXII, 8.]

And its symptoms are noticeable for about a week beforehand. The sky becomes misty, dust rises from the earth to the sky, gales rage breaking trees asunder. The sun's rays become pale and weak [रविरपटुकरावभासी च].

This type destroys crops, waters, forests and gardens. It produces the following diseases :—swellings, breathing diseases, madness, fevers, respiratory troubles. It produces economic depression [वणिक पीड़ा—विजां क्रमविक्रमजीविनांच व्यथा पीड़ा]. Fine arts and industries suffer.

It [generally] occurs in the following countries :—Kathiawar [Saurashtra], Delhi [Kuru], S. Bihar [Magadh], Bundelkhand [Dasarna], Agra and the neighbourhood [Matsya].

According to some authorities the bad consequences are punctuated by accompanying phenomena like fall of meteors, rise of circles [परिवेष] round the sun, etc., which sometimes denote international and political complications.

The full effects of a bad type of earthquake take six months to dissipate. The *Vayavya* type takes four fortnights.

The extent of the operation of the Vayavya type is 200 yojanas (1600 miles.)

The Fiery or Volcanic Type

The *nakshatras* peculiar to this type are also named :—

पुष्पाग्नेयविशाखाभरणीपित्र्याजभाग्यसञ्ज्ञानि ।
वर्गो हौतमुजोऽयं करोति रूपाण्यथैतानि ॥ (32.12)

Its preceeding symptoms are :—fall of meteors, fiery appearance of quarters (दिग्दाह), outbreak of fire with gales. Its effects are loss of clouds, disappearance of water-sheets, international enmity, skin diseases, jaundice, etc.

It generally occurs in Bhagalpore, Monghyr (Anga), Bactria, Badrinath district (Tangana), Orissa (Kalinga) Bengal (Vanga,) Tamil country (Dravida), Orissa Agency (Savara) and Asmaka (W. Malwa). To these Parasara adds Oudh (Ikshvaku), Kullu (Kuluta), Pamirs (Tukhara), Baluchistan (Sibi), Jalandhar-Kangra (Trigarta), North Bihar (Videha), etc.

Its extent of operation is 110 yojanas (880 miles.)

I am omitting the details about the types *Aindra* (produced by excessive rains) and *Varuna* (produced by internal waters) (32, 16—22). The zone of the latter, it may be noted, includes North Bihar (Videha).

Mixed Types

According to the Elder Garga and other authorities, there are mixed types of quakes, and the types have their definite periods of the day and night—*e.g.*, in the fore part of the day or night the Vayavya quakes take place. In the middle of the day or night, the volcanic ones take place ; in the third part the Aindra and in the fourth part, the Varuna. But this theory of time was rejected by Parasara as unsound.

Pre-Historic Earthquakes

According to Hindu scientists, especially Parasara and his school, there had been continuous earthquakes of a terrible type in India when hills arose and disappeared. It is noteworthy that the Puranic (cosmogony) story of mountains flying from one place to the other has been explained by Parasara as a phenomenon of the early earthquakes, fully recognizing that mountains in India rose up due to quake actions.

The subject deserves attention and study at the hands of technical scholars.

HINDU AND MUSLIM PUBLIC SPIRIT IN BENGAL

By RAMESH CHANDRA BANERJEE

IN view of the Muslim community's demand for a preponderating share in the administration of Bengal, to be fixed by statute, it will not be improper to start an enquiry into the comparative amount of public work done by the two communities; for a community's claim to superior Govermental powers can only be justified by its superiority in the field of public service. In the present paper, I propose to deal with the two most important branches of public work, *viz.*, educational and humanitarian (*e.g.*, Medical relief), and to give an idea of the output of work both by Hindus and Muslims, independently of Government patronage. No kind of purely sectarian work (for example, the educational charities of the late Haji Md. Mohsin for the benefit of Muslims alone) will be dealt with in this connection.

Educational Work

Lest I should err on the side of over-strictness to Muslims or supposed to be guilty of vagueness of statements and guess work, I will not speak here of the Calcutta University, as an institution. At the same time, the fact cannot be overlooked that this big University owes its extraordinary growth and development to Hindu brains, Hindu labour and, to a great extent at least, to Hindu money. Even if I omitted to mention this well-known fact, a comparison between the number of Hindu and Muslim endowments for scholarships, stipends and prizes to be awarded to University students leads to a conclusion which admits of no doubt. There are altogether 266 Hindu endowments at the disposal of the University, some of which are of very substantial value (*e.g.*, Sir Rashbehari Ghose, Sir Taraknath Palit, Maharaja of Khaira, Maharaja of Cossimbazar Trusts amounting to a good many lacs of Rupees).

There are five Muslim endowments, four are of the total value of Rs. 6,000.* Of these three are such that Muslim students have the best chance of securing their advantages while at least 259 Hindu endowments are for the benefit of all University students, irrespective of caste or creed.

Next we come to Colleges and High Schools. The question of high education is of great importance on account of the fact that men who seek Government service of a higher grade are not deemed to have necessary qualifications, unless they have received high education (by which expression I mean both College and High School education). A scrutiny of the official list published in 1913 shows that the number of non-Government (Arts) Colleges in Bengal is 38, of which 3 are apparently founded by Muslims (1 being open to Muslim students only), 6 by Christians (*i.e.*, Missionaries) and the rest, that is, 29 by Hindus. Of these 28 are open to all classes of students. From the same official report it appears that the number of non-Government (aided and unaided) High Schools in Bengal was distributed among Hindus, Muslims and Christians as follows—37 apparently founded by Muslims, 30 by Christians and 1006 by Hindus, if we exclude 1, 6 and 1 High School founded respectively by the Hindu States of Cooch Behar, Tipperah and Sikkim.

	Founded by Hindus.	Founded by Muslims.
Non-Government Colleges	29	3
Non-Government High Schools	1006	37

Though the activities of our Muslim friends look so insignificant their power in the Education Department of the Government of Bengal is by no means negligible. In fact Muslims are the lords of this region. We have read a lot about the work of the Text-Book Committee. This body is domineered over by Muslims to an incredible degree. Beginning from the Personal Assistant to the D. P. I., every Muslim gentleman seems to possess sweeping powers. The T. B. Committee

* One is of the annual value of Rs. 5,000.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

works through various sub-committees and each and every sub-committee must have at least one Muslim, if not more, on it. These Muslim members are the dictators of the sub-committees. If he or they object, no text-book can be approved; and one must not enquire whether these dictators are competent enough to pronounce judgment on books on Science, Mathematics, Hygiene or any other subject; that they are Muslims is sufficient. At their dictation History is going to be re-written. Such is the Muslim-ridden Text-Book Committee which is lording it over the High Schools of Bengal, of which only 37 are founded by Muslims as against 1006 by Hindus.

The pernicious influence of communalism is not restricted to the T. B. Committee alone; it holds full sway in the Inspectorate of the Government as well. In reply to the question of Seth Hanuman Prosad Poddar in the Bengal Council (16th March 1931), the Hon. Khwaja Nazimuddin (Minister of Education) laid a statement on the table in which the following appears :

	Inspector of Schools	Second or Additional Inspector	District Inspector	Sub-Inspector
Hindu	2	3	19	124
Muslim	3	5	9	118

Since then things have much worsened. Apart from minor changes, at least four Divisional Inspectors are Muslims at present. Yet there are other noticeable things in the same statement, *viz.*, there were mentioned twenty-six inspecting officers specially appointed to see that Muslim education flows through the proper Islamic channel. These gentlemen were—Assistant Inspectors of Schools for Muhammadan Education—5; Special Sub-Inspectors of Schools—13; Assistant Sub-Inspectors—2; Inspecting Moulavis—6.

One may be inclined to think that, though the Muslim share in the work of spread of education in the province may be negligible as compared with that of the Hindus, in taking advantage of the facilities offered by the existing educational institutions, the Muslims may not be lagging behind. To satisfy this curiosity, the following figures (taken from Supplement to the Report on Public Instruction in Bengal, published 1932) are given showing the progress of Muslim learners in general as well as professional institutions. Instead of cumbrous numbers, only percentages of Hindu and Muslim students are quoted here.

University Education

	Percentage of Hindus to total pupils.	Percentage of Muslims to total pupils.
Colleges General Arts	83·4	13·7
Colleges Professional Law	72·6	26·1
Medicine	85·8	8·9
Education	50·0	26·6
Engineering	87·9	9·4
Commerce	92·9	2·9
Veterinary	71·6	20·5
Total for Professional Colleges.	78·5	17·9
Total for Colleges	82·1	14·6

School Education

	Percentage of Hindus to total pupils.	Percentage of Muslims to total pupils.
For Boys :		
High stage	79·8	18·3
Middle stage	73·1	25·6
Primary stage	45·5	53.3
For Girls :		
High stage	69·5	1·9
Middle stage	67·1	3·9
Primary stage	42·9	54·9

To the superficial observer the percentage of Hindus in primary schools seems to be lower than that of Muslims. But there is one thing to be remembered in connection with this, *viz.*, that Muktabs are included under what are officially called "Primary Schools." By a careful perusal of the above official report, we find that, for the same year, the number of Muslim pupils attending "Primary Schools" is 929,570 (boys) and 280,903 (girls), or a total of 1,210,473 (more than 12 lacs); while the number of Hindus is 793,622 (boys) and 219,219 (girls), or a total of 1,012,841 (more than 10 lacs). Again, the statement showing the progress of Muktab education shows that altogether 814,087—(580,988+2,468) boys and (23,329+2,07,302) girls (Statement No. 24)—boys and girls (roughly 8 lacs) were pupils of boys' and girls' Muktabs.

It is thus clear that of the 12 lacs of Muslim pupils shown as attending "Primary Schools" as many as 8 lacs were attending

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Muktabs (which are officially called "Muslim Primary Schools"). Muktab education is no doubt some sort of education and is certainly better than no education, but one should not fail to consider whether education imparted under the shadow of communalism in institutions where propaganda of communalism is a main part of the teaching is in any way conducive to real enlightenment of the pupils and whether these boys have a fair chance of holding their own in a fair and unhampered competition with boys receiving education in schools where education, and nothing else, is the object in view. If we deduct 8 lacs from the total of 12 lacs of Muslims, the remaining 4 lacs (pupils in non-Islamic primary schools) offer a poor comparison with 10 lacs of Hindu pupils in general primary schools and the inflated majority percentage of Muslims in primary schools shrinks into less than half the Hindu percentage.

After all, this high percentage in primary education is somewhat misleading. The main report (published in 1932) on Public Instruction, Bengal, (pp. 37-38), says :

> "These percentages (in primary education) do not present a true picture of the advance made in education by the Muslim community, for in the higher stages there was an absolute fall in numbers."

II. Humanitarian (Medical Relief) Work

Now let us see how our Muslim countrymen stand in the sphere of the sacred work of giving relief to sick and suffering humanity. For facts and figures in this connection I will rely on the "Annual Report on the Working of Hospitals and Dispensaries for the Year 1930," published in 1932, which is, by the by, the latest report available, I understand.

I shall leave out the hospitals and dispensaries founded and financed by Government and local bodies. For our purpose, those founded exclusively by private individuals are necessary, as they will indicate more truly each community's spirit of service and the actual output of work in this line. The following brief statement is given of hospitals and dispensaries in Bengal that have been founded expressly by Hindus, Muslims and Christians to commemorate, in most cases, their own or others' names :

Mofussil Hospitals and Dispensaries

	Hindu	Christian	Muslim
Burdwan Division	36	17	2
Presidency ,,	32	10	1
Dacca ,,	41	10	2
Chittagong ,,	12	2	3
Rajshahi ,,	9	5	1
Total	130	44	9
Calcutta	6	8	0
Grand Total	136	52	9

for the whole Bengal

Of the hospitals and dispensaries given here under the head "Christian," only 6, as far as I could gather, are founded by Christian Missions ; the rest are named after Magistrates, Commissioners, Governors and similar eminent Christian gentlemen. Those who know the naturally philanthropic Hindu, will not doubt that in the case of most, if not all, of the charitable institutions, the major portion of the money at least has come from Hindu pockets. Scores of instances may be given but the following, I hope, will suffice :

In Calcutta, Mayo Hospital, Prince of Wales Hospital, Lady Dufferin Hospital, Carmichael Hospital, etc. ; in the Mofussil, Lady Dufferin Hospital (Dacca), Stevenson Moore Dispensary (Bishnupur—24 Parganas), Carmichael Charitable Dispensary (Krishnagore), Balla Earle Charitable Dispensary (Mymensingh), Lady Dufferin Zenana Hospital (Chandpur), Sitabganj Lady Mackenzie Dispensary (Dinajpur), King Edward Memorial Hospital (Midnapur), Lady Curzon Zenana Hospital (Suri), Price Charitable Dispensary (Naogaon), etc. etc.

However, leaving aside these institutions, the fact that there are as many as [illegible] *hospitals and dispensaries expressly founded and financed by Hindus as against only [illegible] by Muslims in the whole of the province* enough to prove which community has rendered greater public service in this respect. There is also a large number of dispensaries which are mentioned as "Private-aided" and which are named after the places where they are located. I have left these too out of consideration here, as well as others that are described as "private-non-aided," no details of which are found in the official report.

But it may be argued that mere superiority in number of dispensaries cannot indicate greater amount of benefit rendered to the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

for one hospital or dispensary with very great capacity may do more work than a number of smaller institutions of the same kind. To meet this argument, I quote below the number of patients served by each of the eight Muslim hospitals and dispensaries throughout the year (figures for one were not obtained):

	Patients treated during 1930.
1. Angerson (Pindira) Haji Osman Guni Charitable Dispensary (Dist. Burdwan)	10974
2. Imambara Hospital & Dispensary. (Dist. Hugly)	10414
3. Russa Prince Golam Muhammad Dispensary	8410
4. Melanda Nayebulla Charitable Dispensary. (Dist. Mymensingh)	14010
5. Patuakhali Begum Hospital and Dispensary.	11528
6. Colonel Hat Md. Hakim Nazir Charitable Dispensary. (Dist. Chittagong)	4838
7. Lady Dufferin Faizunnessa Zenana Hospital, Comilla (Dist. Tipperah)	7621
8. Hatia Char Mir Md. Ali Charitable Dispensary. (Dist. Noakhali).	2900
9. Taherunnessa Bibi Choudhurani Female Dispensary. (Bogra)	(Figures not obtained).
Total	70695

In spite of the usually communal nature of Muslim charity, let us take it for granted that these institutions are open to all.

To match these, I will take only four dispensaries founded by Hindus (in Moslem-majority districts):

	Patients for the same year.
1. Brahmanbaria Jagannath Madan Gopal Charitable Dispensary. (Dist. Tipperah)	27445
2. Jafarganj Sovabazar Raj Charitable dispensary. (Dist. Tipperah)	10385
3. Abutaraf Rajlaksmi Charitable Dispensary. (Dist. Chittagong)	20365
4. Banagram Syam Sunder Charitable Dispensary. (Dist. Mymensingh)	16742
Total	74937

There are still 132 hospitals and dispensaries founded by Hindus in and out of Calcutta to be taken into consideration, including some very big ones; for example:

	Patients treated during the same year.
Surja Kanta Hospital (Mymensingh)	35260
Shambhunath Pandit Hospital (Calcutta)	30566
Syama Charan Eye Hospital (Calcutta Medical College)	28570

We thus arrive at the irresistible conclusion that in this branch of public work, too, the Hindu's contribution is incomparably greater than that of the Muslim.

These are the achievements of the Muslim community of Bengal, whose boast of numerical superiority sounds ludicrous by the side of their poor performance in the sphere of two most important branches of public work. From the community which demands the lion's share in the Governmental powers of the country, we might have expected greater and better work for the good of the country. It is, however, never too late to mend. Instead of expending their energy in manœuvring violent movements against Hindu landowners, and money-lenders and organizing the defence of such Muslims as are accused of crimes against defenceless Hindu women, leaving the relief work in times of famine and flood to be done by the sentimental Hindu for the benefit of the Muslim masses, let Muslim leaders turn their attention to work of real public utility so that all classes of their countrymen, irrespective of their caste and creed, may enjoy the fruits thereof and they themselves may attain a position befitting the majority community of the province.

I cannot conclude this paper before saying a few words more. I have tried to see that whatever figures are given here are correctly put and no statement is made which is not justified by facts. If, in spite of this, errors have crept in, I shall be grateful to those who will point them out. But my conviction is that nothing will be found that will affect the main substance of my contention. I should also like to add that I have purposely left aside certain matters which might have still more strengthened the case for Hindus. I could at least have mentioned the latest instance, within my knowledge, of the over-anxiety of the Hindus for humanitarian work which is fully taken advantage of by Muslims.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Very recently the cry of "Famine in Jessore" has been raised by Hindu papers and Hindu leaders, and money is being collected by Hindus. In Narail centre, I understand one relief committe has raised Rs. 600 of which Rs. 6 is the contribution by two Muslim gentlemen, while some 90% of the sufferers are Muslim. And Jessore is a district where Muslim domination has been thoroughly established through the agency of the District, Local and Union Boards.

January 21, 1934.

REALISM

By SITA DEVI

IN the city of Calcutta only the fortunate few may have space enough to stretch their limbs at will. Only eye-witnesses would believe the state, the poor people live in, in this second city of the Empire. So it is no use describing it. The middle-classes enjoy many amenities of civilized life, but scarcely any luxury. Still they cling to the city through force of habit and also because the villages have no use for them.

Manoranjan Babu was just such a middle-class person. The family was fairly big, and his salary was not adequate. His widowed mother lived with him and he had his wife and five children. Relatives from his village home, and friends from every quarter of India paid him regular visits throughout the year. So their habitation was nearly always crowded with people.

The house was situated in a lane, a bit off from the main street. It was a two-storied building. Manoranjan Babu occupied the ground floor because his family physician had advised him to do so. His wife's heart was rather weak and she could not go up and down the stairs very often. So they lived on the ground floor, though it was inconvenient in many ways. The upper floor was occupied by an Anglo-Indian family.

Each flat consisted of four rooms, two middle-sized and two rather small. Manoranjan Babu was not modern in his views, but neither was he very orthodox. His daughters went to college—one was in her third year, the other was in her first. Neither had been married as yet. He was frankly for female education, but he had his doubts about free mixing of the sexes. But he was rather non-interfering in his temperament and generally followed the line of least resistance. A few young men used to frequent his home. They were either very distantly related or were friends of his sons. His wife spoke to them. So did his daughters. When the girls were very young, every room was open to everybody, but now that they had grown up, one of the smaller rooms had been converted into a sitting-room. The other rooms had their doors curtained now, to make it clear to outsiders that these rooms were private.

The sitting-room was used as such during the daytime alone. At night the furniture was pushed into a corner and the eldest boy of the house, called Natu, slept there on the floor. If there happened to be any male guest, he also slept there. Of the larger rooms, one was occupied by Manoranjan Babu and his wife, who slept there with the younger children. The other one was the bed-room of the girls.

It was a very hot and sultry day of summer. The whole town seemed to pant with the heat. The fortunate few had electric fans, but the sun too seemed to send out fire instead of air. The less fortunate fanned themselves with palm-leaf fans and rolled on the cold cemented floor in the vain hope of getting a bit cool.

Manoranjan Babu had no electric fans, and to make it worse, the house was crowded with guests. A friend of his, named Rasik, had arrived from the United Provinces, with his wife and daughter. They were on their way home to a Bengal village and were breaking their journey here for a day or two.

A faint breeze had sprung up in the evening. The whole family together with the guests had assembled on the inner verandah, which served them as the dining-room. Sulata, the eldest girl, deserved the credit for this arrangement. She did not like to squat down anywhere and everywhere for her meals, neither did she like the sight of dirty plates and glasses, lying scattered all over the place. So she had taken the initiative in converting the verandah into a dining-room and making her father buy a dining table.

They were having their tea now. Sujata was pouring out the tea, whilst Sulata was serving buttered bread and sweetmeats to the guests. Many sweetmeats were ordered in honour of the guests.

"You cannot have any luxury of the table in Cawnpur," Rasik Babu's wife was saying. "We have nearly lost our Bengali palate and have become U. P. people. But we can stretch our limbs there, I must say that in fairness to that town.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

bungalow is a large one and we don't know how to use so many rooms. The servants have occupied them."

"We are content with this little hole," said Manoranjan Babu. "We have forgotten all our grievances in the joy of getting plenty of fishes to eat. How many days in the month do you get fish there?"

Before Rasik Babu's wife could reply his daughter Aparna put in, "How many days in the month you ask? You should rather say, how many days in the year. Even then we don't know whether we have fish or dried twigs, from the taste of the thing."

Manoranjan Babu looked admiringly at Aparna and said, "But your health has not at all suffered on that account. You can pick up both my daughters, one on each hand, at the same time."

The girls burst into laughter. "We cannot even walk properly, due to want of space," said Sulata. "How do you expect us to be robust and strong? Still Sujata had won prizes in our school sports. I never joined even in that."

"When we go back this time," said Rasik Babu's wife to the two girls, "we shall take you two with us. You shall see how you improve within two months."

"But don't you have epidemics of plague there, every year?" said Sulata's mother rather in alarm.

"That may be, but people live there all the same," said her guest. "We have been living there for ten years and we are not dead yet."

Aparna was not probably liking this topic, so she interrupted with "I cannot call Calcutta any cooler than Cawnpur, I must say. There we seem to dry up with heat and here we are boiled. I think it is worse. Please finish your tea soon, I want to go out somewhere for a breath of fresh air. It is impossible to stay indoors now."

They finished their tea in a hurry. The buttered bread and sweetmeats were scarcely touched. Then the girls went to their rooms to get ready.

Aparna had taken shelter in the girls' room. Her parents moved about from room to room. Rasik Babu had contracted the habit of sleeping outdoor and here too, he slept out on the dining table. His wife could not sleep on account of the heat and tossed about restlessly. For Aparna, too, it was too hot inside the room, but she was obliged to stay in.

Everybody finished dressing soon. They put on their lightest clothing and went out. Only Sujata's mother remained in, as she had to see to the preparation of dinner.

The party walked on for a bit, then they took the tram. After getting down from the tram, they walked again for some time. When they finally returned home, it was already very late.

"What is this?" said Manoranjan Babu's wife in remonstrance. "Do you know the time?"

"Oh, never mind," said her husband. "It is so hot that one cannot come inside before ten o'clock."

"Well, it is nearly ten," said his wife. "You must sit down to dinner at once."

They washed their hands and faces and sat down to eat. The walking had given the whole party an appetite and they did justice to the dinner.

After dinner, as the table was being cleared, Rasik Babu said, "I shall do like last night and sleep out here. I have become such a lover of the outdoor that a roof over my head seems to stifle me."

"But sleeping here is nearly the same as sleeping on the road. This place is totally unprotected. That bit of a wall serves no useful purpose," said his hostess.

Rasik Babu laughed aloud. "But I am neither a beauty nor something made of gold," he said, "so I should not provoke any thief."

So he had his way. The table was wiped clean, and Rasik Babu's bed was spread there. Manoranjan Babu went to sleep with his son. Rasik Babu's wife joined her hostess in her room.

Aparna did not at all like the hot little room in which they had to sleep, but she knew that her protests would be of no avail here. Calcutta people have no use for those upcountry manners and would never allow a girl of her age to sleep out in the open.

The girls spread a bed on the floor, because the bedstead was too small to hold three persons. Sulata felt the heat too much and slept on the cool floor. Sujata was fond of ease and liked her bed soft, so she slept up on the bed.

Aparna did not like a bed, even if it was spread on the floor. "Give me a mat please," she said, "it is too hot for heavy bedding of any sort."

Sulata took away the mattress and sheet and brought out a Japanese mat for Aparna. "What else can I get for you?" she asked.

"Oh, nothing else," said Aparna, "I want plenty of cool air, but you cannot get it for me. If we could have kept the door open, as well as the windows, the room would have been a bit less hot."

Sulata said, "We could have kept that door open, if Natu were not sleeping there in the drawing-room."

"Oh, it does not matter," said Aparna, "what can't be cured, must be endured. But I must keep a glass of water here. It is one of my bad habits. Whenever I wake up at night, I want a drink of cold water. Now don't you get up please. I can get it for myself quite easily."

Aparna got up and went out. After a while she came back with the water, in the biggest metal tumbler of the house, and placed it by her pillow.

It was nearly eleven o'clock. Everybody thought it late enough and made preparations for going to sleep. A few whispers were heard at first and the swishing sound of palm-leaf fans, then all grew quiet.

A night breeze had sprung up, as is usual in Calcutta, but it did not find free entrance inside the rooms. In this big family only Rasik Babu was enjoying a comfortable and sound sleep. The wind entered the other sleeping rooms in fitful gusts, being impeded by the heavy curtains. It only served to make the heat more unbearable during the intervals.

Aparna dozed fitfully, being disturbed by the heat. Outside the night wind roared, the doors and windows banged and here they all lay sweltering. What a climate to live in ! But the other two girls appeared to be deep in sleep. Aparna had become nearly as wild as her father —she could hardly bear a roof over her head.

Again she dozed off. She heard an indistinct sound as if of a door being opened. It must be the wind, she thought and sank into sleep. The palm-leaf fan fell from her hand on to the floor.

The door between the two rooms opened slowly. Someone was coming into the girls' room from Sulata's mother's room. But the figure was not that of a woman. The room was full of shadows, only a thin streak of light from the street lamp entered through the window and lighted up one corner of the room. The intruder could see by the help of this light that one girl was sleeping on the bed and two others on the floor.

At first he tiptoed to Sujata's bed. The girl was sleeping soundly. He bent down to examine whether the girl was wearing any jewellery or not. There was nothing much, Sujata being a modern miss of seventeen. At this age many young ladies suddenly feel a distaste for the world and its wealth, and dream of taking to an ascetic life. They adopt the plainest of dresses and cast off all ornaments. Sujata was just passing through this phase.

The man moved off to where Aparna was sleeping. She had some gold ornaments on, being the only child of a rich man. She was wearing a costly gold chain and a pair of heavy gold bangles, as well as some 'churi's.'

The man took out a small electric torch and examined the ornaments. They appeared good and easy to obtain. He placed the torch back in his pocket and began trying to remove the bangles very carefully. They fitted very close to the round smooth wrists. The man in his haste pulled a bit hard. This was sufficient to wake up Aparna, as she was but dozing. She pushed away his hand and sat up straight on her mat.

An ordinary Bengali city girl would have fainted at the sight of an intruder in her bedroom at midnight. But Aparna was of a different type. Besides being almost domiciled in the United Provinces, she was accustomed to the sight of thieves and dacoits. As she tried to spring up from the mat, the man clapped his hand on her mouth forcibly to silence her cries.

But Aparna was not to be silenced so easily. She kicked Sujata on the back to waken her up, all the while struggling with the man to make him let go his hold. Sujata woke up and screamed loudly at the sight that met her eyes. The man let Aparna go, and sprang for the door of the next room. Aparna took up the heavy metal tumbler and threw it at the man with all her strength.

Her aim had been good. The man fell down with a loud cry. But the next moment he rose and darted out proving that his injury had not been serious.

The whole family was awake by this time. The two ladies were screaming with all their might, while Manoranjan Babu had rushed into the girls' bedroom to see what had happened. Natu rose and gave chase to the thief.

Rasik Babu too woke up. As he was trying to get down from the table, on which he had been sleeping he saw a strange man, trying to scale the compound wall. He rushed at the man and actually caught hold of him. But the man sprang away and over the wall, leaving a piece of his shirt in Rasik Babu's hand and some blood stains on the wall.

The family on the first floor was also awake. They had turned on all their lights and were enquiring what had happened. The house was searched all over, to find out if any other thief was hiding anywhere. But nobody else was found.

Everyone came back to his or her room after a while. A small pool of blood-tinged water had accumulated on the floor of the girls' bedroom. It was wiped off. Natu objected at first. He wanted to leave everything as it was for the police to see. But the rest of the family did not agree with him. What was the use of making further fuss by calling in the police, when the thief had not been able to take anything ?

"You are a real Amazon, my dear," said Sulata. "The thief will never forget you."

Aparna was still panting in excitement. "I wish I had something better at hand, to make him remember me, by," she said.

"The thief was a dandy too," Sujata said. "Don't you see, he has left behind a sample of his silk shirt ?"

"It is really amazing," said her sister. "I have never known a thief to be dressed in silk before. He must have been in love with Aparna."

"Oh indeed ?" said Aparna, "As you see, I am but an Amazon, not the sort, persons fall love with. If he was in love, it must have been with either of you pretty damsels."

The rest of the night passed off thus. No one slept any more. Everybody wondered how the thief had got in. A door of the bath-room, which led to the lane behind, was found open. But how it had been opened, no one could explain.

In the morning friends and relatives came in. The thief was the only topic of conversation for several days. Then gradually everyone forgot him.

But I hope the reader has not forgotten

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Let us see how and whence such an interesting person appeared.

The reader must go back a fortnight. Chittaranjan Babu, the editor of the magazine *Bullari*, was seated in his office, correcting proofs. His assistant Khagen was busy over a pile of manuscripts, he was dividing them into two piles. Some were marked as accepted and some as rejected. The last named ones formed by far the bigger pile and Khagen was constantly adding to it. A few people were seated here and there, evidently waiting.

One of them came forward after a while and sat down on a stool by Khagen's side. "Have you gone over my manuscript ?" he asked in a whisper.

"Yes," answered Khagen shortly, "I am sorry we cannot accept it."

The man's face nearly turned black in disappointment. "Why do you say that ?" he asked again. "I have written it very carefully. Will you please show it once to the editor ?"

Khagen seemed to lose his temper a bit. "We are here, so that he might not have to look over every blessed manuscript," he said. "But, of course, I have no objection if he is willing to look it over." He drew out an exercise book from amongst the pile, and pushed it towards the anxious author.

But the man had assumed his dejected air again. "Oh well, since you say it won't do," he said, "I don't want to trouble the editor for nothing. But will you please tell me why you reject it ? The plot was a good one and I was very careful about the language and style."

"My dear sir," said Khagen, "people want realism now. They have no use for idealism or imagination, nowadays. Romance is being swept out of Bengali literature now. I don't hold the same view, but we must give the public what it wants."

"But is it so very unreal ?" asked the poor author.

"Well, I must say it is," said the sub-editor. "Take, for instance, the place where your hero Arun has entered the bedroom of the heroine surreptitiously at night. Is not that highly unreal ? Do you know of any Bengali girl who would fall in love with a thief ? She would have shrieked the house-roof down."

"But cannot there be any exception ?" said the author Ramesh. "Every girl may not conform to the general rule."

"Well, that is quite possible," said the overworked Khagen. "There have been cases of human beings possessing four legs. But you can hardly introduce such a person in literature as a hero."

Ramesh got up, with the rejected manuscript in hand. "Well, then good-bye," he said. "I shall try to alter it, as you say." He prepared to walk out. Khagen felt a bit sorry for the poor man.

"Yes, do that and bring it back," he said. "The style and the plot is all right But give them some 'realism' stuff and you can go home with the money."

Ramesh went out. Another young man, who had been sitting at a distance, also came out at the same time. As soon as they had passed the office building, he placed his hand on Ramesh's shoulder and asked, "Why are you so cast down ? These people have to talk like that, you know. They cannot print all the good stuff they get, else they will have to make their paper thrice as big as it is. Don't you listen to them. The public wants realism, he said ? That is stuff and nonsense. I am one of the public, ain't I ? I can tell you I am sick to death of realism. We get too much of it in real life to want it in fiction."

"You are my friend and so you are trying to console me," said Ramesh. "Why should they reject good stuff ? Real good writing is not so plentiful as you seem to think."

But Mahitosh still went on, "I tell you it is all rot. You cannot write stories about real things. There are only three real things in Bengal, *viz.*, malaria, the marriage problem of girls, and clerks with big families. How long can one write about these ? Too many people have already discussed them threadbare. So, of course, we have to draw upon idealism now."

"I don't write for fame and recreation," said poor Ramesh, "else I would not mind my stories being rejected. But I am a poor clerk, with four real children and a salary of sixty rupees only. If they had accepted the story and given me the fifteen rupees for it, I could have paid the milkman's bill."

"Who bothers about such things ?" said Mahitosh. "But alter it and see what they say."

Ramesh did not answer at once, but walked on slowly. As he came close to his house, he said, "But what is the use of my altering it ? What is realism to me may not be real enough for the editors. Our experience of real life is hopelessly limited. Just as you say, there are only three real things in our life, *viz.*, malaria, the problem of a daughter's marriage and too many children in a poor home. Thanks to the Holywood films, we get some real good plots, but the editors turn them down as too Western. You might try your best to disguise the American beauty in an indigenous *saree*, but they always find her out."

Mahitosh came up to Ramesh's door, but did not enter. Instead, he walked on slowly towards his own house. He really wanted a cup of tea, but did not want to embarrass poor Ramesh by suggesting it. The poor devil may not be in a position to afford it. Ramesh and Mahitosh had been class-mates in their youth and had still kept up that friendship. Ramesh had married very early in life, with the result that he was

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

sinking lower and lower into the mire of poverty. But Mahitosh had fortunately remained a bachelor and could enjoy life to some extent. It was true, his life was rather empty and meaningless, still it was free from struggle and strife.

By the evening he had nearly forgotten Ramesh, but the poor wretch turned up just then for a trifling loan of two rupees. As it was the end of the month, Mahitosh could not oblige him. He felt very bad about it. He must really try to extricate the poor beggar from his hopeless position, he must indeed.

* * * *

It was two days after the theft in Manoranjan Babu's house. Ramesh was walking in the lane with his youngest daughter in his arms. His wife was busy in the kitchen. Mahitosh came slowly and sat down on the narrow strip of verandah in front of Ramesh's house.

"Why have you put sticking plaster on your head?' asked Ramesh anxiously. "How did you get hurt?"

Mahitosh smiled rather drily. "In search of realism," he said. "But I must admit that the sub-editor was right and you were wrong. You must alter your story."

Ramesh stared at him agape. "Don't look like a drunk fish," said Mahitosh irritably. "Tell your missus to get me a cup of tea."

Ramesh came and sat down by him and asked in a frightened whisper, "Did you really go to steal?"

Mahitosh lost his temper and got up. "Why should I go to steal?" he asked. "But I did trespass, I must admit. Khagen was right. Bengali girls don't fall in love with midnight intruders."

Ramesh was a nervous person. "But don't walk about in this guise," he said. "You might get caught."

"You are mad," said his friend. "Who will suspect me, a gentleman? I am quite safe."

DHRUVA

By NAGENDRANATH GUPTA

Of old King Uttanpada had two queens:
Suruchi, the favoured, and Suniti, the neglected.
One son was born to each: Uttama to Suruchi,
And Dhruva called Suniti mother.

It chanced one day as Uttama sat
On his father's knee while Suruchi, well pleased,
Smiled at husband and child, Dhruva,
The five-year old son of Suniti, came in
And wanted to sit by his brother's side.
The King, his father, spake no loving word,
His little brother smiled no welcome;
Only the favourite Queen knit her brows
And said in accents of scorn, 'Doubtless
'Thou art the King's son, but not born
'Of my womb, and here there is no place for thee.'

Stricken to his child-heart Dhruva sought
His mother and sobbed out his grief
On her sympathetic breast. She sorrowed
With him and soothed him. 'My child,'
She said, 'sorrow is thy portion and mine.
'Call on Him, call on Hari who healeth all
'And helpeth all. So shalt thou find peace.'

In the hushed midnight the child Dhruva
Slipped out of the palace and entered the forest.
No fear he knew and no beast hurt him.
He knew no prayer, he knew no lore,
His dumb young soul went out in quest of the Lord.

For six moons he held silent communion
With the spirit of the Lord, and the days
And nights passed as if they had not been.
Then the Lord appeared before Dhruva
And loosed his tongue and Dhruva prayed.

'Thine is the victory,' said the Lord;
'Thou hast won. Go and rule on earth.
'When thy race on earth is run
'Thou wilt live in heaven as a moveless star.'

Home went Dhruva and eager hands
Held him in tearful welcome; he grew
Wise and strong, and he ruled after his father.
From the earth he passed to the heavens
Where he still shines as the lodestar
Which bears his name. Dhruva is Truth
Immutable, Dhruva is the fixed pole-star
Round which spin the stars and the suns.

INDIAN PERIODICALS

A Poem by Tagore

In *Visva-Bharati News* appears the following poem by Rabindranath Tagore :

She left me her flower of smile
taking my fruit of pain.
She clapped her hands and said,
She had won.

The noon had eyes like the mad,
red thirst raged in the sky.
I opened the basket and found
the flower dead.

Hindu Religion in Java

Dr. Ramesh Chandra Mazumdar writes a paper on the above subject in *Prabuddha Bharata*. We quote the following extracts from it :

It is a matter of common knowledge that Indians established colonies in the Far East—Annam, Cambodia, Siam, Malay Peninsula and Malay Archipelago—as early as the beginning of the Christian era. The acquisition of material wealth and power must no doubt have served as a great impetus to this spirit of colonization, but, in its ultimate effect, the Indian colonies proved to be more and more a cultural and civilizing factor than a mere ruthless exploitation of the less fortunate races of mankind. The Malayo-Polynesian or Austronesian races of the Far East possessed a very primitive kind of civilization, but the Indians succeeded in infusing into them a higher and more spiritual view of life through religion, art and literature. The cultural conquest of the Far East by India is a subject of absorbing interest whose importance we are now realizing only gradually. While the "historians of India have paid great attention to the events in the world outside that have affected India, comparatively little notice has been taken of the manner in which India has influenced the outside world."

Of all the Indian colonies in the Far East the small island of Java furnishes the most striking evidence of a complete cultural conquest by India. As in India, religion formed the foundation of this Indo-Javanese culture. A study of Indian religions in Java is therefore a necessary preliminary to the proper understanding of that culture. This study may be divided into the three following heads : (*i*) The Brahmanical religion in Java. (*ii*) The Buddhist religion in Java. (*iii*) The different religious sects in Java.

The Widow-remarriage in Bengal

In Jimutabahana's *Dayabhaga*, we have mention of the prevalence of the widow remarriages in Bengal. Mr. Jatindra Mohan Datta writes in *India and The World* :

It is a speciality of Bengal that while the rest of Hindu India follows the treatise *Mitakshara*, Bengal follows Jimutabahana's *Dayabhaga* in matters of succession, inheritance and joint-family law. There are disputes amongst the learned and scholars as to the exact date of Jimutabahana ; but the generally accepted opinion is that he was the Chief Justice of the last independent Hindu King of Bengal (C. 1050 A.D.)

In the tenth chapter of the *Dayabhaga* while discussing the rights of an adopted son he says :

"Let each receive the wealth of him from whose seed he was sprung ; and let not the other take it, who sprung from the seed of another person. Accordingly Narada says, 'If two sons, begotten by two fathers, contend for the wealth of the woman, let each of them take that which was his father's property ; and not the other.' "

"The wealth appertaining to the woman, which was given to her by the respective fathers, let the son of each father severally take ; and not the other. It would be needless to enlarge."

From the above provisions of law, it would appear that not only were childless or virgin widows remarried, but widows with children were also generally remarried. Hence the necessity for provision for distribution of wealth amongst the children by two different husbands.

That such widows' sons living in the second husband's family were not looked down upon by society, we have ample reasons to suppose.

—

Conversion and Reconversion to Hinduism During the Muslim Rule

Prof. Sri Ram Sarma writes in *The Calcutta Review* :

It used to be the common belief even among students of history that Hindus never admitted people belonging to other religions to their fold. But a more careful study of our sources has now changed that view and it is no longer fashionable to think of Hinduism as a religion wherein only those had a place who were born into it. Most of the evidence from the Hindu period in this connection has been brought together by Prof.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

D. R. Bhandarkar in his article on *Foreign Elements in Hindu Population.*

But it is still commonly held that Hindu admissions of non-Hindus stopped with the advent of Muslims in this country. The following pages make an attempt at investigating this problem from the pages of Muslim chronicles intent more upon recording the victories of their co-religionists than the conversions of non-Hindus to the Hindu fold. They were not at all interested in this question and when we get some light shed upon this aspect of affairs it is but accidental. Another thing must be remembered in this connection. Under Islamic law the conversion of Muslims to other faiths was a capital crime. One can, therefore, very well appreciate the courage and the fate of those Hindus who may have any intention of converting Muslims to their own faith. Even the reconversion of converted Hindus from Islam was a crime, and thus if we do not find any great movement for the conversion or reconversion of non-Hindus to the Hindu fold we should not be very much surprised. We should hold these artificial barriers created by Muslim law responsible for this state of things rather than hold Hinduism responsible for its being forced to shut its doors to non-Hindus.

But the surprising thing is that even under these adverse conditions we do find recorded examples of conversions of non-Hindus to the Hindu fold, and the reconversion of the Hindus to their old religion after they had once accepted Islam. The cases recorded by Muslim chroniclers are no doubt few and far between but they make for the belief that a larger number of cases might have occurred which these annalists did not try to record. Any way it is no longer possible to believe in the face of the instances quoted below that Hinduism had exhausted its proselytizing energy before the advent of the Muslim in India.

After quoting specific instances of conversion and reconversion to Hinduism Prof. Sarma concludes:

Thus from Sindh to Madura, from Gujerat to Kashmir, from Benares to Thatta, everywhere an almost continuous stream of conversions and reconversions seems to have been running all through the first ten centuries of Muslim rule in India. Hindus not only welcomed their brethren back to their fold from Islam but were prepared to admit Muslims into their faith and did admit them as a matter of fact. Thus another element was added to the make-up of the present Hindu population.

—

Aspects of Modernism

In a thoughtful paper in *The Aryan Path* Mr. Nolini Kanta Gupta says:

We spoke of the extreme atomism of modern science that has thrown into the background the solid unity of creation and is laying emphasis for the moment more upon the division and scattering of forces than upon the cohesiveness and identity of the substratum; still that unity has not been abrogated but has been maintained on the whole, even if as an underlying note. Not only so, the reign of multiplicity, by a curious detour, is working towards a discovery of enhanced unity. The plurality of the modern consciousness is moving towards a richer and intenser unity; it is not a static, but a dynamic unity—a unity that does not suppress or merely transcend the diversity and disparity of its components but holds them together as an immanent force, and brings forth out of each its fulness of individuality. In the same way the present day movement towards internationalism or supra-nationalism has produced a rebound towards regionalism or infra-nationalism. And the voice of anarchism tends to be as insistent as that of collectivism.

The consciousness of yesterday was a unilateral movement. It rose up high and descended deep into the truth of things, but mostly along a single line. In the horizontal direction also, when it travelled, it effected a linear movement. The consciousness of today is complex and composite; it has lost much of the vertical movement; it does not very easily soar or dive, precisely because it has spread itself out in a multitude of horizontal movements. Our modern consciousness is outward-gazing and extensive; it has not the in-gathering and intensive character of the old-world consciousness; but what it has lost in depth and height, it has sought to make up in width.

Simplicity and intensity, sublimity and profundity were the most predominant qualities of man's achievement in the past; what characterises human endeavour in the present is its wideness, richness, complexity.

—

The Sugar Industry

The following appears in *The Mysore Economic Journal*:

The Indian sugar companies have so far suffered from the absence of big-sized fields growing sugarcane in the immediate vicinity of the factories which implies a great wastage as the fields lie scattered over the surrounding tracts. There is great delay between the cutting of the sugarcane and its reaching the factory. In this respect, sugar concerns of Java and Cuba are at a great advantage. Attempts have not been made to combine growing of sugarcane with the manufacture of sugar. Such enterprises are quite possible in Mysore and Western United Provinces where the soil and climate are most suited for sugarcane. In Mysore the size of crop per acre and the sugar content in cane are the highest

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

but so far no attempt has been made to take advantage of these conditions.

In this connection attempts should be made to investigate the possibilities of manufacturing Khandsari sugar by the single pan method especially in Eastern U. P. and Bihar and Orissa. The Coimbatore Imperial Sugarcane Breeding Station should prove useful in improving the yield of sugarcane. The existing Butler Institute at Cawnpore should be taken over by the Imperial Research Council for starting an Imperial Sugar Industry Research Institution or an independent one should be started. An agricultural section should be added to the institute for training students in the sugar industry.

It is also very necessary to safe-guard the position of the cultivators by fixing minimum spot prices for sugarcane. This task should be done by the Government in the absence of any association or chamber of cultivators. Being unorganized, sugarcane cultivators are left at the mercy of the factory owners and the Government should do something to safe-guard their interests. Steps should also be taken to see that prices of cane are paid promptly to the cultivators and the latter should be able to find out the accuracy of weighing machines and the cane should be weighed without delay.

At the conference of the Ministers held at Simla a few months back, a resolution was moved by the Hon'ble Mr. J. P. Srivastava, Minister of Industries to the U. P. Government, to the effect that the number of sugar factories in India should be limited. This restriction on the number of sugar factories is undesirable. It can, of course, secure fat profits during the protectionist period, but such a step would be against the interests of consumers and the industry. Competition is desirable to serve as an incentive to introduce economies in production, but to shut out foreign and internal competition would achieve nothing. Fair field should, therefore, be left for Indian capital and enterprise.

—

The Folk High School in Denmark

Mrs. Kiron Bose toured many countries in Europe and got first-hand knowledge of the educational institutions over there. Of the Folk High School in Denmark she writes in *India and the World*:

This school was established for the peasantry of Denmark. The War of 1807-14 had left Denmark on the verge of bankruptcy, which made the people very poor and miserable. Grundtvig, pastor, poet and a great educational reformer, wanted to awaken the young by means of a school, where personal touch would help to develop spiritual and national character. The superior ideal in the school and was in constant touch with his pupils. The founder of the school insisted on the children knowing more of life than of death. The life in the school was home-like. Boys and girls attended the school at the age of 18 and upward. The school opens for 5 months in the winter for boys and 4 months in summer for girls. They are taught handicraft and given general historical education to be in touch with the world's affairs and to get a better understanding of life. There are a number of schools established on the same model all over Denmark.

These schools have by and by developed qualities among farmers which have won the admiration of the whole world. In the early years, the Danish peasant was still unprogressive, sullen and suspicious, incapable of associated enterprise. But today he is forward looking, cheerful, scientific minded, resourceful and co-operative. The Folk High School inspires their pupils with energy and idealizes labour, and awakens in them a desire for knowledge and a desire to work.

We saw the display of a big bonfire in the school-grounds. In Denmark the midsummer night is commemorated by bonfires all over the country. They are meant as thanksgiving offering to the sun for its light and warmth, for flowers, crops and vegetation, and as a flaming good-bye to the long and golden nights which from that day become shorter, reminding people of the advent of winter with its bleak cold days and its darkness.

—

The Reforms in Ceylon

The following appears in *Young Ceylon* editorially:

Why the traducers of this country both here and abroad persist in drawing a communal herring along the trial of reforms is understandable. The progress in constitutional development in this country has come to that stage when a beginning must be made in the transfer of power and authority. Political responsibility of the State Council is a mockery for the Council is without control of 80 per cent of the revenue. Without the right to control the revenue and the expenditure a State Council cannot safe-guard the wealth and resources of the country. Without such safe-guard political power is a hollow mockery. Hence the people insist on the removal of the Officers of State which is the triumvirate which disburses our resources without question and the strengthening of the powers of the Ministers to initiate financial matters and to control the Public Service. These demands constitute the fundamentals of self-government. All this time we have had the trappings of it. Hence the alien interests have assembled their forces and their auxiliaries. The demand for reform is thus not a scramble for seats notwithstanding the antics of the communalists. The demand cannot be talked off either by alien interests or self-seeking communalists. There can be no popular government in Ceylon with the Ministers providing the money and the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Secretary of State controlling the Public Service and over 80 per cent of the revenue. Thus the cry for reform is on very stable grounds. The recrudescence of communalism, if communalism it is, does not remove the need for reforms or minimize the cogency of the reasons adduced. Hence the compaign must be pursued despite every obstacle for the problem must be settled and settled soon.

—

Modern Bengali Painting

In an important paper in the *Journal of the Indian Society of Oriental Art* Mr. Kedarnath Chatterji traces the history of the growth and development of modern Bengali painting as follows :

Only a matter of some forty years ago pictorial art of quality produced in India was practically unknown.

However, the tide has turned and Indian art is on the way to recognition. It is perhaps not yet time to deal fully with the causes leading to this new orientation since we are as yet in the transition stage, but some of the contributory causes may be discussed.

A principal factor in this transformation was the renaissance movement in Indian art led by Abanindranath and Gaganendranath Tagore.

Somewhere about the end of the last century a young Bengali artist decided to step out of the broad pavement of Western influence and to rediscover the hidden and almost obliterated track that his forefathers had trod. He came of a family that has given to Bengal merchant princes, great landowners, musicians, sages, philosophers, authors and a poet whose fame has spread to the four corners of the earth. In the beginning he had received training in his chosen career along the most approved foreign lines, and had shown considerable talent even in that. But he veered off from the beaten track and ventured into the regions which were till then *terra incognita*. The result of this venture was disturbing—to say the least—in the beginning, and even now it can hardly be said that all controversy has died down regarding the results.

Very soon it had become apparent to Abanindranath Tagore, that the form of art he was pursuing was neither inspiring nor was it capable of providing him with a satisfactory venue for the exercise of his gifts. The visions that rose before his inner eye were impossible of expression in the terms of Western technique. Further the demands of Western art in the matter of realism and exactitude of form and proportion imposed limitations on his brush that were crippling in their effect so far as his imagination was concerned. Therefore, after much thought and deliberation, he decided to forsake modern methods and adopt and further develop the craft of the ancient and mediaeval Indian masters as being likely to be more satisfactory from his point of view. He was encouraged in his venture by E. B. Havell, then Principal of the Government School of Art in Calcutta, who after his transfer from the Madras Government School of Art where he had already started his activities towards the reformation of Indian art schools on a genuinely Indian basis, became an enthusiastic collaborator.

The path of the pioneer was thorny. Every effort of his and of his disciples met with howls of derision from his countrymen who considered any deviation from the Western standards of perfection "degenerate" or "crude." Even today the position is but slightly altered in this country the only change being that most of those who were loud in their condemnation thirty years ago have been now puzzled into silence due to favourable opinions of Western critics.

The name of E. B. Havell will be remembered long as one of the foremost of that group of art connoisseurs who rehabilitated Indian art. It is true that Tagore had already started painting along "Mughal" lines, without any aid or suggestion from Mr. Havell. But when the storm broke, it was the pen and the personality of Mr. Havell that gave shelter and solace to master and pupils. Furthermore Tagore's school was afforded recognition through his being appointed Vice-Principal of the Government School of Art, Calcutta, at the instance of Mr. Havell who was then the head of that institution. This came the turning-point, inasmuch as the new methods and the new adaptation of the ancient craft received a fresh impetus through diffusion into ardent young minds.

Abroad the writings of Havell, Okakura, Sister Nivedita and others had already drawn attention to the art of ancient India. Now the new adventure started drawing the attention of foreign connoisseurs such as Sir John Woodroffe, Lord Kitchener and others.

At home Tagore's friends, including some of his relatives and Ramananda Chatterjee, editor-proprietor of the two foremost monthly journals of India, boldly espoused his cause. These friends, specially those who tried to give publicity to the new school, had to face severe criticism and ridicule—even abuse—at every step. Indeed in the beginning it was plain that public reaction was not at all favourable. Lampoonists and humorous writers joined in the witticisms, illustrated with cartoons, appeared in the pages of all periodicals interested in the movement, the sole exception being the journal of the editor above-mentioned.

But in time the very violence of this reaction had a favourable effect. First of all it roused an interest amongst that section of the intelligentsia which was interested in Indian art. Paintings by the various schools of the mediaeval and late Mughal period, frescos of Ajanta, sculptural decorations of the ancient temples were all studied with a new insight

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

resulting in a national art-consciousness, which was totally absent before.

It would be wrong, however, to presume that this art-consciousness had in any way smoothed the path of the new school so far as public appreciation of their art was concerned. But imperceptibly the tide had turned. Amongst those who had delved deep in the hoards of ancient treasure there were some who received ample reward for their labours.

To tell the truth, a large section of these supporters of the Tagore school was composed of foreign aesthetes—European and Japanese—and it was mainly due to their support that this new school was able to establish itself on a fairly secure foundation.

Meanwhile his brother, Gaganendranath Tagore had begun experimenting with the latest developments in Western art, and was soon able to fully absorb their spirit and, combining that with Eastern ideals, to produce a new technique entirely his own.

Fresh fields of thought and theme were explored, and the work of younger artists such as Surendranath Ganguly, Nandalal Bose, Kshitindranath Mazumdar, Sailendranath De, Asit Kumar Haldar, Sami-uz-Zaman, Hakim Muhammad and many other Hindu and Muslim students soon proved that the school was not the sterile product of one personality but was capable of producing new developments both in thought and style.

As for the measure of achievements of Abanindranath Tagore, was it not ample to have made a whole nation art-conscious, by restoring their faith in the culture of their forefathers? Was it not achievement to prove that there was a living stream of art-culture flowing in the land of his fathers and further to open the eyes of the understanding to the arts and crafts of ancient and mediæval India? And lastly what more success could there be for an artist than to see the path which he opened followed by a thousand artists and craftsmen, as the direct and indirect result of the labours of the school, founded, inspired and nourished by his art? As for the ideals he preached and practised, this is not the place to give an adequate survey, of the manner in which they were realized in his paintings.

Lean years have descended upon the world, and art and the artist are now faced with trials perhaps so severe as to jeopardize their very existence. In such times it is easy for the public to forget the debt of gratitude it owes to those that have worked for the liberation of art in India. Nevertheless the renaissance of Indian art is in progress, and if it can weather the storm and pass into more placid waters it will be then that it shall be realized what phase it was that Indian art entered on, with Abanindranath Tagore as the pathfinder.

—

Abolish Capital Punishment

Mrs. Margaret E. Cousins suffered imprisonment in the last Civil Disobedience campaign in Madras. In jail she had the opportunity of coming in contact with women condemned to various terms of imprisonment—and also to death. There is something beautiful and good even in those who are condemned to death. And they should be saved by abolishing capital punishment. She writes in *The Young Builder*:

My recent experience of the system of legalized murder has branded the horror, the shame, the uselessness of it into my soul, and the risk of mistake in it. The group of Civil Disobedience prisoners in the women's jail in Vellore lived in cells in the same line as the small block called "the condemned cells." For almost three months one young woman about twenty-two years old was in one of those cells under sentence of hanging while she awaited results of Appeals she made to three high authorities for the commutation of her sentence. She made a favourable impression on all who saw her or talked to her. She denied her guilt. But her Appeals were not granted. We know the night before that she was to be choked out of existence the next morning in the presence of the staff. There is a telepathy in jail, as in all parts of India, despite all precautions of administrative secrecy. We knew that she was perfectly calm and brave as she walked to the gallows and that her last words were her affirmation of her innocence and her belief that God would punish the guilty person. The existence of a system of punishment which allows no chance of life to such a person is self-condemned. All that day, and for days afterwards, I went about in shame. I felt that our social system had degraded everyone of us in being a party to such a brutal, disgusting murder in cold blood, and with official ceremonial.

It was with deep happiness that I saw in the newspapers some weeks later that Mr. Gaya Prasad Singh had introduced a Bill in the Assembly to abolish capital punishment, now awaiting ballot opportunity for discussion. Belgium, Denmark, Holland, Italy, Norway, Portugal, Sweden, and some of the States in America have abolished the death penalty. They have found no increase in crime as a result.

Last year the Maharaja of Nepal announced by Proclamation that capital punishment would not be inflicted for an experimental period of five years as it was entirely repugnant to Indian ideals. Thus one Indian State has already set a precedent for the country. Lord Buckmaster, Ex-Lord Chancellor of England is one of those who have rooted opposition to capital punishment. He is not satisfied as to its being a deterrent. The opinion of a man of such experience should weigh for much.

FOREIGN PERIODICALS

Quo Vadis, Europa ?

The Living Age anticipates a Far Eastern Symposium in four leading articles on Asia under the general caption "Asia Awakes," which focus our attention on what is certain to become the centre of world attention :

In the first, under the above title, Prince Karl Anton Rohan, editor of a Berlin National-Socialist monthly, discusses the fear of many Europeans that the centre of gravity of world politics has been shifted from the West to the coast of the Pacific by the very recent union of Communism and Capitalism :

In Constantinople a German electric-light bulb costs 1·80 rentenmarks, a Russian, 0·35, and a Japanese, 0·60. This means that the Russians and the Japanese have succeeded in taking over our economic and productive methods and, by maintaining or introducing slave labour, have gained an important advantage over us. The present struggle for the division of world power takes the form of a struggle for world markets, and many Europeans are convinced that if the Orient achieves its purpose of economic and, therefore, military armament, its ruling classes, which are today demanding heroism and slavish sacrifices from the masses, must grant more liberal institutions and raise the popular standard of living. But in the face of this conviction the fact remains that those countries with the lowest, most slavish standard of living have attained the highest production and that they are being guided by statesmen whose historic perspective reaches beyond the immediate struggle for power. These men take long-range views and act in such a way that they become a serious danger to the economic hegemony of the white race.

It needs little imagination to conceive of how the world would look if not we but the Russians and the Japanese were to sell machine-guns—the modern equivalent of glass beads—to savages.

—

Land Problem in Japan

The second depicts the views expressed by two Communists on the increasing tension between the poor tenants and the Imperialist landowners, said to be Fascists at hearts :

In the last few years the debts of the peasants have increased enormously and in 1932 amounted to between seven and eight milli yen. The *Transpacific*, a paper published Tokyo, wrote in its issue of August 17, 'T peasants are tilling the soil to pay their debts they work and live to pay off debts.'

In such a situation the tenants and sha croppers are, of course, unable to pay the re to the landowners. The class struggle betwe the tenants and landowners has assumed fierce character. According to figures publish in the Japanese press, in the first half of 19 there were 2,200 conflicts, which means that th number had doubled compared with the previo year. The lower strata of the village populati before all the poor tenants, have organized them selves in semi-legal associations. The poor a middle peasants are organizing self-defe groups for the fight against the landowners, pol and gendarmerie, and in order to repel t Fascist bands. There are at present in Jap 4,208 tenants' associations with a total membe ship of 302,000.

The landowners and *kulaks* on their part a combining in associations for the fight agai the tenants ; they are organizing Fascist uni such as *Airod Tzjuku* (School of Patriots), wh took part in the attempted insurrection on M 15, 1932. In all, there are 640 landowne organizations with 53,000 members. In additi there exist 1,980 mixed associations, in wh landowners and *kulaks* are organized, with a t membership of 308,000. The big Japanese Fasc organization, *Dainichon Sai San-to*, is actually federation of 30 Fascist organizations and known by its active participation in the f against the tenants, the murdering of t leaders, and so forth.

Along with the intensification of the cl struggle in the village there is an increase in t struggle of the urban proletariat. According official, but incomplete, government returns, the first half of 1932 there were 843 stri participated in by 53,247 workers, compared w 944 strikes participated in by 48,366 workers i the previous year. The number of strikes in co nection with wage demands has increased.

The Communist Party of Japan, under exce ingly hard conditions of terror and espionag is carrying on a persistent struggle in order t rally the masses together, is openly combatin the ruling classes and the Fascist groups, a posing the imperialist nature of the latter, a revealing the true character of the war in Chi In spite of wholesale arrests (in the year 1932 there were 7,000 people in prison accused

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

'Communist activity') the Communist Party is increasing its efforts to win the masses of the toilers.

There are special Fascist organizations in the mines which agitate among the factory workers. There are over 100 Fascist and semi-Fascist organizations in Japan, which together number millions of members.

—

Asia for the Asiatics

In the third article Dr. Hurwicz fears that though a pan-Asiatic movement may not find immediate fruition by the establishment of a League of Nations of the Asiatics, yet he cherishes the view that the slogan 'Asia for the Asiatics' may unite the Orient against the Occident under the leadership of the Land of the Rising Sun:

To gain a real understanding of the pan-Asiatic idea, one must always keep the following three points in mind. In the first place, it would be absurd to deny that the awakening of the Asiatic peoples is the greatest event since the War, but we must not confuse this awakening with the unification of the Asiatic peoples, for, in the second place, the inner conflicts between these people will remain impossible to solve. One thinks in this connection not only of Sino-Japanese rivalry but of the equally important hostility between Mohammedans and Hindus. In the third place, the pan-Asiatic movement, which is now so active and anti-European in Japan, the strongest Asiatic power, is itself torn with contradictions and cannot become a leading creative force. Many of the more critical Japanese recognize this themselves. Dr. Hitoshi Ashida, a member of the Japanese parliament, has said, 'The problem of an Asiatic League of Nations that is now so popular may unify the nations of Asia in their mistrust of Europe and America, but the decisive question for us is co-operation with China, without which such a league would be nothing but a name.'

—

Soviet and the League

Many far-reaching effects are anticipated by the Soviet Unions' project to join the League at Geneva, which, according to an observation in the *People's Tribune* will, to a great extent, lessen the aggravated political atmosphere in the Far Eastern horizon. The editor comments:

When Soviet Russia, at last, showed its determination to resist Japanese aggression, the Roosevelt regime showed its sympathy by a rapprochement here also. Just what passed between Roosevelt and Litvinov on the subject of the League we do not know, but there is no reason to doubt that the Russo-American rapprochement was an important factor making for the new Russian attitude towards the League.

According to a *Transocean* report from Moscow January 4, after the speeches by Molotov and Litvinov, referred to above, were made, "the possibility of the Soviet Union's joining the League of Nations forms one of the main topics of discussion in political and diplomatic circles" in the Soviet capital, where it is held that "what Russians like to term 'Japan's moral isolation' is mainly due to the League of Nations, which has revealed itself as a serious obstacle to Japan's imperialistic expansion, and therefore is an important factor for maintaining peace in the Far East." Trying to forecast the future, *Transocean* suggests that the Soviet "is greatly interested in a closer co-operation with Geneva, and it is assumed that in the natural course of events Moscow will send a permanent observer to the League capital, and after a certain transition period will apply for membership in the League of Nations."

There is no real reason to doubt the *Daily Herald* report of January 8, to the effect that "France is now engaging in secret conversations with Russia with the object of bringing the Soviet Union into the League of Nations," but "inasmuch as the Soviet Union desires certain reforms in the League prior to joining, the present conversations between the Quai d'Orsay and the Kremlin are of the nature of a preliminary examination of Russian suggestions for reform." If the latter is true, it is quite understandable. In view of certain events of fairly recent history, the Soviet is not unnaturally supicious of being made a scapegoat by some one of the dominant League Powers, and is quite as cautious as the United States has been. If, however, the Soviet authorities decide that League membership is desirable, there will be no recalcitrant Congress to obstruct them: the Government will act, and the Soviet Congress will in course of time approve.

As a result, a new League can be envisaged, with its "Super-Council" of France, Britain, and Italy reinforced by the co-operation of America (as at present) and the Soviet, whether or not the latter actually joins the League.

—

Pan-American Prelude

In the *New Republic*, Mr. Jonathan Mitchell gives a graphic description of the political situation of the Latin American Republics on the eve of the seventh session of the Pan-American Conference:

Uruguay is living under a barbed-wire dictatorship. The day the American delegation arrived all Uruguayan leaders known to be hostile to President Terra were rounded up and imprisoned.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Nevertheless, at the same moment Secretary Hull was being ceremoniously greeted at the quay, the Montevideo police were busy removing red flags and a placard, "Abajo de Hull" fastened to a high, near-by chimney. The chiefs of the opposition to President Terra are the Battle brothers, members of Uruguay's best known family. They have been in exile in Rio de Janeiro for about a year, but last night one of them turned up in the suburbs of Montevideo, conferred with friends and slipped away in the darkness, presumably for Buenos Aires. The result of all this is that the Uruguayan government is finding great difficulty in keeping its collective mind on the pan-American Conference.

A League of Nations commission of investigation is now in Paraguay, and any action by the Conference would, consequently, be a blow at the authority and prestige of the League.

The Roosevelt administration is throwing away a great opportunity here at Montevideo. Never before has Latin America felt so kindly towards us as it does today.

But it was a major mistake to send Mr. Hull as head of the American delegation. Granting that all discussion of tariffs and debts will have to be reserved for some future occasion, a great deal of useful exploratory work could have been done here by a delegation which was representative of the New Deal and which possessed the confidence of Mr. Roosevelt. Mr. Hull, with all his magnificent sincerity and high-mindedness, is not such a person. He has little sympathy with the New Deal and almost no influence in the administration.

Already this situation has led to one disaster. On board the "American Legion," the ship on which Mr. Hull came to Montevideo, was the Haitian delegation, of which M. Justin Barrau, Haitian Minister of Justice, is chief, and among the members of which is M. Antoine Pierre-Paul, one of the most interesting men at the Conference here. The first day at sea, the Haitians waited upon Mr. Hull in his cabin, and petitioned for the ending of the American fiscal control of their country. According to an executive agreement now in force, American control of Haitian governmental finances is to continue during the life of a $23 million loan floated through the National City Bank, or until 1952. Previously Mr. Hull had had only casual knowledge of the United States occupation of Haiti, and as he learned of its sordid and cruel details, he became strongly indignant.

The United States is now, morally at least, on the defensive in regard to Cuba. Mr. Roosevelt has implicitly admitted that we were responsible in part for the Machado regime, and that we owe it to Cuba to make amends. The Cubans ought to seize this chance to obtain a clear, definite understanding with the United States. They ought to ask for a guaranteed sugar quota; most authorities on Cuba believe it should have a quota of 2 million tons a year. There should also be a thorough understanding about the various Machado loans. It should be informally agreed that if the National City and Chase National banks are willing to make a generous settlement with the Cuban government, Cuba will have the right without fault-finding by our State Department to resort to partial default.

If there is ever to be a permanent settlement of the Cuban problem, Cuba must find some way to prevent the greater part of its national income from leaving the island each year. Probably this means, in addition to a reduction of its external loans, some sort of tax on the American-owned sugar centrales. It might also mean the setting up of minimum-wage and maximum-hour laws for workers on the centrales. Such things ought to be talked out and understood both in the United States and Cuba before any sort of definite agreement between the two governments is arrived at. Otherwise, there is the danger that, the moment Cuba tries to set its economic house in order, trouble will start up again at once.

—

Race Conflicts

Dr. Hans Kohn in a Radio Address under the auspices of the National Student Federation of America, rouses the attention of the enlightened onlookers to the alarming effect of race-consciousness, which has prejudiced many. It is also very keenly felt in this ancient land of the Hindus and is one of the root causes of the present political upheaval in this country. The following extracts from the *World Unity* may, therefore, be read with much interest:

As Alexander the Great set out on his campaign to conquer the world, his teacher, Aristotle, advised him to treat the Greeks as a leader, and a friend, but the barbarians, whom he set out to conquer as a tyrant and king.

Aristotle had, in the first chapter in his book on politics, developed the teaching that slavery was an institution imposed and sanctified by nature, as there were human races born to be slaves and others who were born masters. Therefore, slavery was not only a moral institution but it was even in the interests of the slave that themselves as, by their own nature, their very being demanded the master's hand over them.

This theory by Aristotle was, of course, not confined to Aristotle or to the ancient Greeks. It was brought forth as a justification of the eminence of one race over another wherever a race dominated another.

The political and social importance of modern race theory is not less far-reaching than its intellectual implications, for this theory is bound to awaken the fiercest race conflicts. In historic situation where the race question assumes dimensions unknown up to now. Race conflicts do not become acute until the race kept in

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

inferior position is animated by the tendency to change its status and to strive for equality with the race deemed superior. We witness today a world-wide movement of this kind. Fifty years ago the world accepted the supremacy of the white race without question. Today the spread of education and of modern technical equipment throughout the world, the bringing together of all human races by the new rapid means of communication and transportation, have destroyed for ever this unquestioned order, and have introduced a new, dynamic element which makes itself felt not only in the revolt all over Asia but as well in simlar movements for political and social emancipation outside of Europe which have reached their crises during the past few years in all Latin American republics, where even the long silent and suffering Indian race is awakening to a claim of its due position in its own ancient lands. Throughout Africa the Negro is stirring, a phenomenon which would have appeared entirely out of question a very few decades ago. There is a great forward movement on the part of all the non-white races which we called, only a few years ago, backward races, and who are today trying hard, and sometims, as Japan proves, very successfully, to adopt for themselves the cultural and social standards of the white race. They strive not only for political emancipation but for a social advancement of their masses to participate in the progress of humanity toward a better world.

I believe that all lovers of humanity will welcome this common effort of all human races toward a new world. It is, for the first time in world history, that such a common effort binds different and even the most distant parts of the world together. The basis of world unity is being created. In such a moment a new emphasis upon race and race inequality in many countries must have especially disastrous effects. It will tend to aggravate all race conflicts and therefore act as chief obstacle to world peace. No conflicts are as devastating as racial conflicts, no hatred as degrading as racial hatred, because they appeal to the most primitive and most ferocious instincts of man and are apt to bring out the worst sides of his nature. We very often witness the fact that a normally good-natured and reasonable man acts most brutally as soon as race prejudice or race instincts are involved. Through centuries we have striven to arrive at the recognition of personality, not of birth or race, as a standard of the value of man. The race theory means a regression from a spiritual point of view to a biological point of view.

Liberalism believes that man can be changed and improved by education and by social influences, race theory believes, that a man has to continue as he has been born. Therefore, race theories in the present form are not only dangerous for world peace and humanity at large, but as theories of despair bid us to accept man and races as they are and to give up every idea of their improvement. The theory of racial inequality will, therefore, not only precipitate us into endless race conflicts, but make a combined human effort to create a new world futile !

—

The Dongan Charter of Political Liberty

Mr. Wynne shows in the columns of the *America* how the Charter, inaugurated by Col. Dongan, Governor of New York, precipitated the freedom of the American colonies :

In these days of amending the Federal Constitution and of revising State, county, and city charters, it is quite in order to review the story of "The Charter of Liberties and Privileges" framed and signed 250 years ago by the colonial Governor of New York (1682-1688), Col. Thomas Dongan. That charter was the first embodiment of the principal rights for which all the American colonies some ninety years later fought until they achieved independence from England and founded a republic which is now paramount among the nations.

The story of this document is a political epic. The conditions which prompted it, the swift and unerring action of the man who designed it, the high-minded co-operation of his associates, and the assertion of popular rights up till then unclaimed by any English colony—all recall the story of the Magna Charta of England itself (1215-1225), and of the "Great Privilege" later in Burgundy, 1477. The Dongan Charter is more comprehensive and liberal than either of these, and its influence more far-reaching. Its vestiges are still visible in the principles of our Federal Constitution ; in the charters of many a State and city government, particularly in New York ; and in British colonies in other parts of the globe.

In brief, the Charter asserted for the colonists equal political rights with citizens in the home country, if not greater. It defines the powers of the Governor of the province, of his Council, and of the Assembly. It determines the qualifications of voters, the privileges of representatives, the number to be elected for each of the twelve counties. It provides for trial by jury ; representation as a condition for raising taxes by any method whatsoever, mentioning the seven then in practice ; it protects property rights, for women as well as for men, and the widow dower rights. It insists on indictment by jury, release on bail, martial law for army and navy only ; it forbids quartering troops in private homes except in time of war, and it proclaims equality, not toleration merely, for all "who profess faith in God by Jesus Christ." Jews are not mentioned in this clause on religious freedom.

Dongan, however, without waiting for the King's approval, had begun to apply the charter as soon as he issued it and he continued ruling in

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

its spirit even after it had been vetoed. It was thus he inaugurated the movement for liberty which finally won for all the colonies freedom from England, and even for British possessions the freedom they would otherwise have never known.

—

Assembly of the League of Nations

In an address given at Chatham House, the Rt. Hon. W. Ormsby-Gore, M. P. discusses the deliberations that took place at the Fourteenth Assembly, which are reproduced below from the *International Affairs*. It is on the much-vexed problem of Minorities:

The longest and most lively debates of all took place on the subject of Minorities. This subject was initiated and introduced by the German delegate in a speech which was in terms not only a challenge to neighbouring States, but proclaimed to the League the Nazi doctrine of *Volkstum*, and ended up with a public denial that the Jews in Germany had any right to be regarded as a minority, though they were so regarded in all the States such as Poland, Czechoslovakia, Greece, etc., having minority clauses under the supervision of the League in their Peace Treaties.

After much argument and a good deal of plain speaking in sub-committee, the Sixth Committee sent forward to the Assembly the following three resolutions:

"The Assembly,

1. Reiterating the recommendation which it passed on September 21, 1922:
   Expresses the hope that the States which are not bound by legal obligations to the League with respect to minorities will nevertheless observe in the treatment of their own racial, religious or linguistic minorities at least as high a standard of justice and toleration as is required by any of the treaties and by the regular action of the Council.
2. The Assembly considers that the principles expounded in resolution 1, which reaffirms the recommendations of 1922, must be applied without exception to all classes of nationals of a State that differ from the majority of the population in race, language or religion.
3. The Assembly requests the Secretary-General to inform the Council of the discussion that has taken place in the Sixth Committee on the question of minorities as a whole."

The German delegate in the sub-committee had voted alone against the second resolution and carried his opposition to the plenary Assembly, where unanimity is required. His single vote means that this resolution was accordinly "not adopted."

There certainly was more public interest at Geneva in these minority discussions this time than in any other subject, possibly because it raised issues that are far nearer the bone of current controversy and far more potentially politically explosive than any other matter raised at this Assembly.

—

Chinese Youth in the Crucible

Mr. Roland Hall Sharp draws a very fine pen-picture of Young China in the columns of *The Christian Register*:

Youth in China has blazed with zeal borrowed from strange new Western teachings. It has dashed with enthusiasm against the solid but invisible wall of limitations imposed upon China by age-long beliefs, practices, economic conditions and outside restrictions. Repulsed by the intricately laced problems before which the world's thinkers stand admittedly at a loss, Young China has not been sobered, or discouraged, or turned to pleasant ways of forgetting.

Yet a residue remains more determined than ever to seek and find a solution of its country's baffling problems. Like the Great Wall as compared with crumbling crimson pillars of less enduring monuments, these serious young people recognize that with them lies the preservation of national integrity.

China's loose dominion is being ground down on the edges at more points than in Manchuria and Jehol. We who have been accustomed to think of China as including Tibet, Hsinkiang and Mongolia, learn with surprise that these great periphery provinces on the west and north are passing rapidly under outside influences, whether Russian, Japanese or British. Chinese officials admitted to me that the struggle of Nanking to establish effective political and financial links with these areas makes little or no progress.

Young China feels its borders contracting around it. The New China offers no immediate hope of stopping the process of attrition more evident in Manchuria and Jehol. Students at summer schools in Peiping could not escape feeling the shift of effective political and economic power in North China to Japanese hands. Yet they go quietly about their studies and sports. Two reasons account for this attitude. Public manifestations by students have come under official disapproval, and students themselves have had the edge of their resistance to Japan dulled. Banging heads against walls that do not give soon becomes tiresome.

One of the most searching questions facing Chinese youth is the policy to be adopted toward recovery or abandonment of provinces now passing under outside hegemony. Many young Chinese blaze with angry projects for building up a military machine that some day may drive the strangers into the sea. Others hold to non-resistance and traditional Chinese methods of assimilating armed conquerors.

A Prambanam of India.

By G. S. DUTT

IN the village of Mathurapur in the district of Faridpur, rises a massive terracotta structure towering about 70 ft. above the ground, which although now in a greatly damaged condition with trees growing on its slopes and summit, is still the most prominent landmark in this locality for miles around, and is popularly known as the Mathurapur Deul. In this structure, which would appear, for centuries, to have escaped the serious attention of historians, artists and archaeologists alike, Bengal possesses a monument which is destined to be regarded, for more than one reason, as the Prambanam of India and to earn for her a place of unique distinction in the sphere of art by virtue of the originality of its architectural design and the remarkable virility of its figure sculpture.

This fact, which was discovered by me on the 26th September 1933 when I first visited the Deul, was publicly announced in October 1933 on my authority in a Press note from which an extract is given below:

"In the course of his recent tour in the interior of the district of Faridpur, Mr. G. S. Dutt, I.C.S., Director of Industries, Bengal, has, it is reported, discovered in an ancient monument of the later 17th or early 18th century at Mathurapur in the Rajbari sub-division of the district, features which he claims to be of considerable archaeological and cultural interest. The monument in question is popularly known as the 'Mathurapur Deul.'...

"He proposes to move the Archaeological Department for the conservation of this important monument with a view to preserving it from further decay...."

The above Press note, which was fully published in some papers, embodied my first impressions of the monument. The present article is intended to be the first of a series relating to this monument in which I propose to substantiate the claims as to distinction and originality which I made therein in respect of this structure and to give to the world a complete description of this important monument which may form the basis of further research on the part of specialists in various spheres.

As a result of subsequent research since the discovery of this monument, my first impressions have been corroborated and reinforced. I will briefly summarize here the salient features and prominent characteristics of this monument.

The first feature that strikes even the most casual observer is the unusual dodecagonal shape of the entire structure from the base to the summit. The general appearance of the structure is that of the Bengali Deul retrogressing slightly

The author (centre) at the site

from the base upwards up to a height of about 29 ft. from the ground level after which the curve is continuously accentuated up to the summit. At the height of 29 ft. from the present ground level, there is a break in the general scheme of the architecture in the shape of a massive cornice. The general scheme of structure of the building is again continued above this cornice but with this striking difference, that there is a complete absence of any sculptural or decorative work. The crown appears to have been entirely destroyed and a considerable part of the vaulted top has collapsed, leaving an open vent to the sky. There is no trace whatever left of any *Amalaka* or *Kalasa* and it is therefore impossible to say whether these originally formed part of the crown. There has been extensive damage of the summit and of large portions of the upper slopes on account of the growth of vegetation while saline erosion has entirely destroyed the decorative terracotta work up to a height of about 5 ft. above ground level.

Reverting to the architectural features, each facet of the dodecagon is of the *Pancharath*

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

type ; that is to say, there are five vertical bands or *pagas* running from top to bottom of each of the twelve facets of the Deul. Here again, however, there is a striking originality which characterizes this Deul and which, so far as I know, is quite unique. The Pancharatha bands, instead of consisting, as usual, of a projecting vertical ridge in the centre with gradually receding pilasters or *pagas* on each side, here consist of a central vertical recess with two vertical bands of *pagas* on each side, rising progressively to a higher level in vertical steps from the centre towards the sides. In other words, the usual scheme adopted in the shape of such structures, which have an elevated Central Rahapaga and a gradually receding Anarthapaga and Konakapaga on each side, is entirely reversed in the design of each of the twelve facets of this Deul.* The Deul, in my opinion, was apparently never used or intended to be used as a temple of worship or to be dedicated to any deity. The more one examines its sculptural features, the more one is inclined to hold the view that the Deul must have been built as a Victory Monument. This conclusion is forced upon one not only by the general warlike atmosphere that appears to have been deliberately imparted to the figure sculptures depicting the stories of the Ramayana and of the Krishna-lila but by what is perhaps the most striking feature of this monument, *viz.*, the magnificent lion belt which forms a girdle round nine of the twelve facets at a height of about 28 ft. from the ground as the structure now stands. This lion belt appears to be quite unique in originality of conception and design and consists of a belt of terracotta plaques depicting a row of lions in the act of marching through fields of lotus buds. Each lion figure is represented in an attitude of being about to crush a lotus bud with its fangs. While a detailed description of this superb belt of plaques must be postponed to a later part of this article, I must place on record my opinion that in the whole field of sculpture it would be difficult to find a treatment of the lion motif which can equal this Mathurapur lion motif in vigour and virility of design. The conception of this lion motif and its concentrated and prominent insertion at a height of nearly 30 ft. above ground level in the shape of an almost continuous row of marching lions forming a girdle round nine out of the twelve sides of the deul could only have been the work of a master architect-sculptor of consummate genius who was impelled by the object of featuring it as the dominating symbol of Victory. Another feature with which the Victory atmosphere appears to have been successfully brought about, is the row of lion gargoyles and scenes of wrestling of extraordinary virility. There are three different types of Kirtimukhs which are of original and virile nature and which also heighte the warlike atmosphere intended to be conve by the whole structure. A detailed descripti of the Kirtimukhs is reserved for a la article.

The next prominent feature of this monume is the systematic narrative illustration, by series of figure sculptured plaques arranged tiers rising one above the other, of the wh story of the Ramayana and the entire story of Krishna-lila. These figure plaques are arrang tier over tier in 13 successive tiers on the th western facets constituting the front side of monument and are strongly reminiscent the famous sculptural decorations in stone the temple balustrades of Prambanam in Ja The same virility, vigour and lifelikeness, same predominatingly dramatic and mascul note which characterizes the serial figure sculptu of Prambanam is noticeable here ; and if so thing, in an even more striking degree, allowance being made for the fact that Prambanam structure is constructed in sto whereas the Mathurapur Deul is built of humbler material of terracotta fashioned out the native clay of Bengal.

Yet another remarkable feature which ma this monument out among the monuments Bengal is the characteristically Bengali concepti design and execution of the architecture toge with the typical Bengali character of the sce depicted, such as continuous rows of Beng cottages with their familiar curved roofs, sce depicting contemporary Bengali life and custo typically Bengali poses of the human figures, traditional bunches of paddy ears hanging from roofs of the Bengali huts, and the graceful drap of the figures of Bengali *sarees*. Not the le striking feature about the human figures is t virile poses of the male characters and graceful dignified poses of the females, the extraordinar simple yet gracefully plastic stylization of the lin of the Bengali *saree* worn by the female figur rendered with consummate genius by a sin vigorous curve of terracotta. In short, I consi this Deul to be a monument of national imp tance of the first magnitude for Bengal and t Bengalees, inasmuch as it gives us a striki glimpse of a singularly virile culture whi belonged to the Bengali race. When furth investigated, it will be found to be a perenn source of pride and inspiration to t whole Bengali race by virtue of the s that while in its architectural grandeur sculptural excellence it can stand compari with the great monuments of western and south India, it is at the same time, in a special sen Bengal's very own, from the living clay of beautiful terracotta plaques and decorati sculpture, to the sculptor who fashioned them well as to the types of the human figure, and female, with which its walls are peopled, alike in its design, conception and execution

* For the architectural terminology used here, see *Orissa & Her Remains* by Mano Mohan Ganguly, pp. 111 *et esq.*

Digitized by Arya Samaj Foundation Chennai and eGangotri

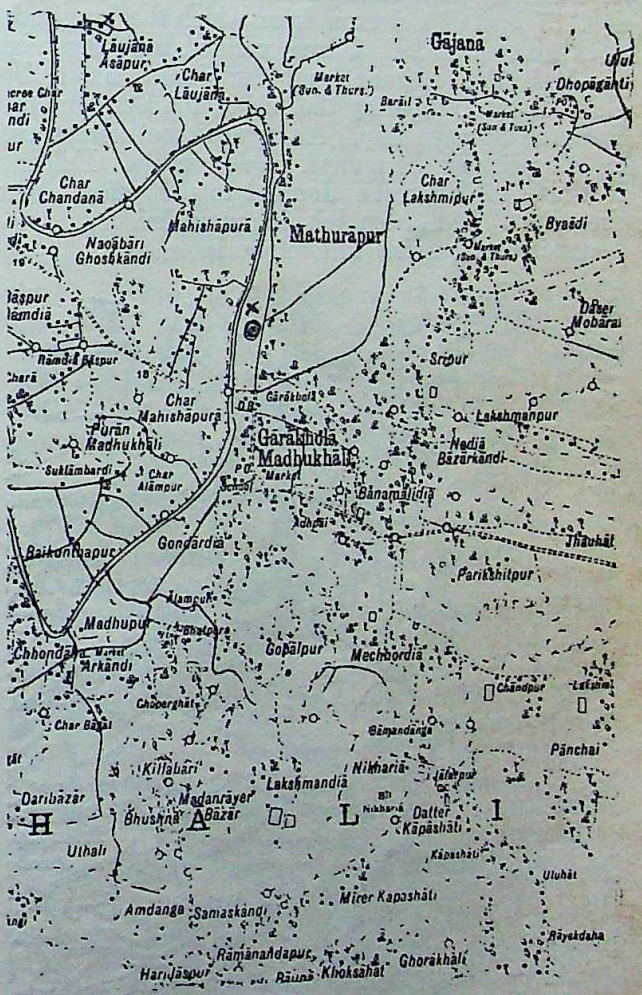
appears to be purely a product of rural Bengal, totally untouched by any extraneous influences even from other parts of India. Herein it differs from the other great ancient national monument of Bengal, *viz.*, that at Paharpur which, while being of much greater antiquity and larger dimensions, undoubtedly bears the unmistakable impress of Imperial Gupta and other influences extraneous to Bengal.

Nowhere in the whole field of art and architecture have the simple dignity of rural Bengali life been delineated with such visible pride of feeling and such masterly success in execution. A curiously interesting feature, which will fill every Bengali heart with pride, is the naive manner in which the rural sculptor—for he was undoubtedly a folk sculptor of rural Bengal—has depicted all the scenes of the Ramayana and the scenes of Krishna-lila as taking place not in distant Lanka, Brindaban or Mathura but in the artist's own home surroundings among the cottages of Bengal with Bengali men and women as their heroes and heroines.

We shall now proceed to the topographical details regarding the monument. The village of Mathurapur where it is situated lies in the Rajbari sub-division of the Faridpur district. It is between the Naliagram and Madhukhali stations on the Kalukhali-Bhatiapara branch of the E. B. Railway and is about three miles from Naliagram and one mile from Kalukhali. The monument itself is situated about a furlong to the west of the railway line (the railway line is not marked on the Revenue Survey map, a portion of which is reproduced along with this article). The situation of the Deul is about half way between the railway line on the east and the river Chandana on the west Shortly after one leaves Naliagram station, the top of the Deul becomes visible over the intervening villages from the railway line, while one has a very prominent view of the top of the Deul overgrown with trees from the railway line opposite to the spot. The *kutchery* of the present zemindar of the village Babu Harakumar Lahiri is about 100 yards to the south of the monument. At the very foot of the monument there lies a hamlet inhabited by men of the potter caste. These men are expert sculptors and their ancestors were, in all probability, the sculptors of the Deul itself. Although now in an extreme stage of poverty and stricken with Kala-azar in an endemic form, these potters still display considerable mastery of their craft and it was obvious from some of their productions that they still follow the ancient traditions of their forefathers. The statues and figures of deities, such as that of Siva, made by them still have the same indigenous characteristics as in ancient days, unlike the articles manufactured in Krishnagar and in the neighbourhood of Calcutta which show distinct western influences.

Perhaps the earliest mention of the Deul is the one that occurs in Major Rennell's Journal. Major Rennell's Memoirs, dated 8th and 10th July 1764, include the following remarks :

> "8th July 1764 : This afternoon saw a high Pagoda to the S. E., distant 2 or 3 miles. It lies near the village of Motrapur.
>
> "10th July : Passed the Pagoda of Motrapur which lies on the each side of the creek. * Two miles below the Pagoda a large creek turns away to the eastward and is at this time navigable for large boats, but in the dry season is quite dry in some places. It proceeds by way of Jaynagore and Hobbygunje. Here the creek that we are tracing loses its name of the Chunnanah and receives that of the Comer or Comare."



Mathurapur in Revenue Survey Map

The Editors of Major Rennell's Journal (*vide* volume III, No. 8, pages 95-248 of the Memoirs of the Asiatic Society of Bengal) have printed a foot-note to the entry on the 8th July 1764 to the following effect :

> "*Foot-note* : Mathurapur, at the junction of this creek with the Kumar. The temple is said to have been built about 70 years before this by one Sangram Shah of the Baidya family, but was left unfinished because one of the masons fell from

* By the creek is evidently meant the Chandana river.

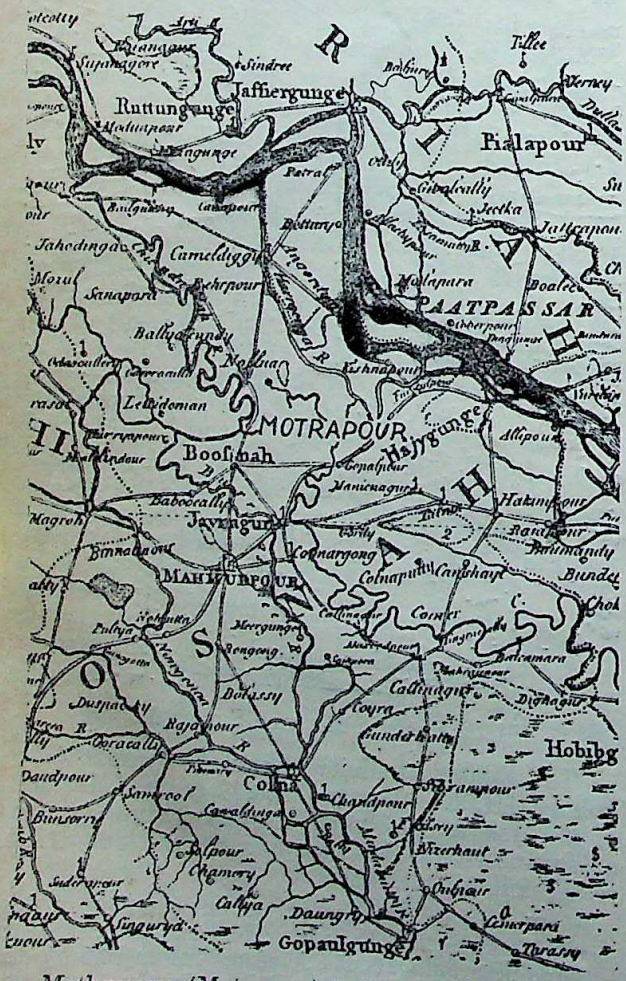
CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the steeple and end. (List of Ancient Monuments, Bengal p. 224)."

The village Mathurapur finds prominent mention in Major Rennell's map ; and although the *deul* itself is not actually marked on it by him, it is easy to identify its position on the map. A reproduction from Rennell's map will be found along with this article.

We are indebted to Major Rennell for locating the exact latitude and longitude of the village of Mathurapur at which the village and therefore the Deul is situated. The latitude is correctly given by Rennell as 23°33′. As regards longitude, Rennell marked the longitude as 1°15′ east of Calcutta, from which the longitude works out as 89°39′. I have verified the correcness of both the latitude and longitude fixed by Rennell by comparing the site of the Deul on the Revenue Survey Map. As regards the correctness or otherwise of the remark made in the Editor's foot-note to Rennell's Journal to the effect that the Deul had been left in an unfinished state, a detailed discussion will follow later.



Mathurapur (Motrapour) in Major Rennell's Map

The most widespread tradition is to the effect that the monument was constructed under the order of a potentate of the name of Sangram Shah. According to a tradition current among inhabitants of the villages for about 10 radius, the monument was originally twice present height, so much so that one could Dacca from its top. According to this tradit the lower half of the monument has now in the ground, the upper half only being visi This is evidently a violent exaggeration ; alth there can be no doubt that there has be slight sinking, which is quite natural, consid the alluvial soil on which the Deul is b Until excavations have been made, the e amount of subsidence cannot however determined.

It is said that Sangram Shah came from north ; some say he came from Kashmir, w others say he came from Rajputana. It is that on his arrival he inquired of the people as to which was the highest caste in locality. On being told that the Brahmins the highest caste, he enquired who were the in rank. On being told that the Vaidyas next in rank, he is said to have describe caste in the words—"Ham Vaidya"—(which is Hindusthani for "I am Vaidya"). The inhabit of the locality, however, not knowing Hindust could not apparently understand the exact m ing of the word "ham" and so are said to taken the name of the caste of Sangram as "Ham-Vaidya." According to tradition himself forcibly married into one of the Vaidya families and also got his daugh forcibly married into the high caste Va families of the neighbourhood and descendants of these families are said to describe themselves as "Ham-Vaidyas" by in token of pride in their connection with illustrious potentate. Sangram Shah, it is ordered a high deul to be built with labour and material under the direction of architect. His orders were that the city of should be visible from the summit of projected deul. The tradition says when the deul was finished and the came on which the consecration was placing of idol inside the deul take place, the architect was asked by Sang Shah to climb on the top and say whether could see Dacca from there. The architect reaching the summit, said that he could not Dacca for the reason that the temple was high enough, but added that this was not fault as had he been given more materials a larger labour force he could have built deul high enough to enable Dacca to be from the top. Sangram Shah is said to have been highly enraged at this remark of architect and to have threatened to put him death for not having asked for sufficient mate in time. As a result of this threat the archi leaped down from the summit and killed himself instead of waiting to be put to death after he climbed down. According to the tradition

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

tragic act made the deul inauspicious and it was consequently left incomplete and no deity was installed in it. This tradition is evidently referred to in the foot-note to Rennell's Journal mentioned above.

Another tradition describes a later potentate Sitaram Roy as the builder of the Deul, but nothing definite is related with regard to Sitaram Roy as in the case of Sangram Shah.

Accepting the first tradition as being more likely to be correct we have to decide as to who this person Sangram Shah was. We find a detailed mention of one Sangram Shah in the Bengali book फरिदपुरेर इतिहास (History of Faridpur) by Anandanath Ray, a copy of which I obtained from the library of the Bangiya Sahitya Parisat. A detailed description and narrative history of the exploits of Sangram Shah are given in this book but I have not as yet been able to find time to verify the accuracy of the references given therein to Todd's *Rajasthan*, Beveridge's History of Bakarganj and to certain volumes of the *Calcutta Review*. In this book it is sought to identify the Sangram Shah of Mathurapur with the Sangram Shah who is described in Todd's *Rajasthan* as one of the Mansabdars of Aurangzib, and also with the chief of this name who fought against the 12 Bhuiyans, conducted a campaign against the pirates and robbers and brought about peace in Bengal and who also subdued the Rathore chiefs of Rajputana towards the latter part of his life. Whether the Sangram Shah who established peace about that time in Bengal is identical with the Sangram Shah who fought with the Rathore chiefs is a question which I have not had time to verify but which seems to call for further research. The identification of this Sangram Shah with the builder of the Mathurapur Deul is, however, supported both by the widespread local tradition at present current in the neighbourhood for miles around as well as from the narrative given in the book referred to above, where it is stated that he actually built his home at Mathurapur and that the Deul which stands there was erected under his orders. Further in confirmation of this tradition, one has to note the vigour and force with which scenes of forcible marriages have been depicted in several of the plaques adorning the walls of the Deul and one is inclined to suspect that in the scenes depicting the forcible carrying away of Rukmini by Krishna, and his marriage with her, the sculptor actually intended to suggest his master's own forcible marriage referred to above and thus indirectly to record the exploits of his warlike master so as to flatter the latter for his valorous exploits. This supposition derives support from the fact that Krishna's figure has been depicted in the traditional form in the scenes of his earlier life as a cowherd in Brindaban, while in those depicting Krishna's forcible carrying away of and marriage with Rukmini, Krishna is shown as an elderly and somewhat corpulent gentleman quite unlike the figure of the Hindu legends. Further research, however, is necessary on this point.

If the above mentioned tradition is to be believed, the Deul was built somewhere about the earlier half of the second part of the 17th century,—probably about 1665 A.D. In the Revised List of Ancient Monuments in Bengal published in 1886 by the Archaeological Survey of India, however, 1472 A.D. (*i.e.*, a period 200 years earlier) has been mentioned as the probable date of its construction, but I have been unable to find any tradition or authority to support this.

The outer walls of the temple constitute a dodecahedron with 12 recessed facets. The inner structure is also dodecagonal, almost up to the summit. The approximate diameter at the ground level are as follows :

Outside diameter	34 ft. 11 in.
Inner diameter	12 ft. 11 in.

thus giving the thickness of the wall at the base as 11 ft. The two doors that are open, face West and South respectively, the front gate facing West. There are two dummy doors on the North and East sides. The east gate has been almost entirely destroyed owing to the growth of a peepal tree. Coming back to the outer dimensions, each of the 12 facets of the dodecagonal structure is 9 ft. 10 in. in length at the base. These 12 facets are built up from the base up to the summit according to one general scheme which consist of tier above tier of mouldings, projecting horizontal ridges of decorative work alternating with horizontal belts of flat plaques in recess in regular order. There is only one break in the general scheme of the architecture at a height of 29 ft. 1 in. above the present ground level as mentioned in the earlier part of the article. The inner wall has a plain dodecagonal face up to a height of about 29 ft. corresponding to the outer cornice at this level. From this point upward up to about one or two feet from the summit, the inner wall is built on a dodecagonal scheme with ridges alternating with recesses, being thus in miniature the same scheme in broad outline as that adopted for the outer facets. This ridging and recessing of the inner wall has given us a unique variation of the corbelled arch which, to my knowledge, has no parallel in Deul temples. At the very top the ceiling consists of a flattened out dome, like the inside of an inverted earthen water pot, in which the dodecagonal shape is not continued. Unfortunately, part of this ceiling has collapsed, thereby destroying its symmetry.

Coming to the temple itself, I am indebted to Babu Ajit Kumar Mukherji of Nalia, a talented young undergraduate of the Vidyasagar College, for giving me information about the existence of this half-ruined lofty structure near

CC-0. Mumukshu Bhawan Varanasi Collection. Digitized by eGangotri

Digitized by Arya Samaj Foundation Chennai and eGangotri

his village home which induced me to avail myself of the last Puja holidays to pay a flying visit to this locality. I stayed as a guest of Ajit Babu's father at Nalia. From there on the 26th September 1933 I first visited the Deul. I trollied from Naliagram station to Madhukhali station in the afternoon and from the railway line *en route* to Madhukhali had my first view of the Deul with its lofty top overgrown with trees. On reaching Madhukhali the Police Officer in Charge suggested my going by road from Madhukhali, but as no conveyance was available, this would have involved considerable delay and as the evening was fast approaching I decided to trolly back about a mile to the point on the railway line just opposite to the Deul and from there to cross the intervening fields. It was, however, far from an easy matter to reach the Deul from here, as all the intervening fields up to the village were covered with flood water with one or two deep ditches to cross. Thanks, however, to the courtesy of some of the attendants, who cheerfully volunteered to carry me on their shoulders over the watery area, I crossed this submerged track on the shoulders of two men. My companions, including Babu Ajit Kumar Mukherji, Babu Sudhansu Ray, artist, a photographer and the thana officer of Madhukhali, all waded through the thigh-deep water. Reaching the village we walked over paddy fields and through the homesteads of the potters to the place where the Deul is situated.

As I came near the Deul I was immediately struck with the unusual dignity and grandeur of its design and construction; but what was most striking was a girdle of terracotta plaques about half way up the building which appeared to consist of some animals on the march which I took to be horses. I found the Deul, up to a height of about 10 ft., completely surrounded by an impenetrable thorny jungle. I made my way to the foot of the Deul with great difficulty through a narrow track from the southern side, getting myself badly scratched in the process. On reaching the narrow southern door of the Deul I found the interior in complete darkness. I noticed some interesting decorative sculpture above the southern door and some decorative work in the walls but nothing specially notable. I decided to enter the dark interior of the Deul. This involved some risk as we had no firearms with us, and there was every probability of wild animals being met, but to our relief the interior was completely empty and not quite as dark as we had thought from outside, as light was streaming in through a large hole in the summit. The only inhabitants were a host of bats which were wildly flying about at the unexpected disturbance made by our entrance in their home. On entering we discovered that besides the southern door there was another on the western side, but passage by this door was impossible as the exit was completely blocked with jungle.

After sending for *daos* and axes and clear a few feet of jungle outside the southern western doors I received my second thrill; here was the front-side of the monum richly adorned with figure sculptures in t cotta relief of extraordinary virility rising upon tier in succession. Unfortunately, the l tiers had become more or less destroyed damaged by saline erosion and growth of t at the base of the building. In my anxiety examine the upper tiers I climbed up a p tree, which grew right along side the Deul a height of about 15 ft. and was impr beyond measure by the important character the sculpture all the way up the walls. By time, however, it had begun to drizzle darkness also began to set in and so I compelled to set out on my return journey the same methods of conveyance as before, Naliagram station three miles away and thence buffalo cart over a muddy road two miles long Nalia village which I reached about 10 P M had by then made up my mind to extend stay until I had thoroughly explored and photographed this important structure.

On the 28th of September I revisited Deul. By that time the coolies whom I engaged with the help of the thana Police cleared a belt of about 10 ft. round the Deul had cut down the trees which had grown al into the temple and eaten deeply into its parts. I found that the entire lower part of building of the Deul up to a height of a 5 ft. had been either greatly damaged or al destroyed in parts through saline erosion growth of trees but that over the three facets, *viz.*, western facet, west south facet and west north-west facet were tier a tier of figure sculpture of the greatest p value. Altogether there were 13 tiers of f sculpture of which 6 complete belts of pl above the western gate were still intact completely examined the building all r from the ground on this day and left instruc with the *naib* of the zemindar, whose kut was very close by and who courteously volun ed his services to collect coolies and to bamboo scaffoldings erected in the course of next morning. It was on the next day there *viz.*, the 29th of September 1933 that, with help of bamboo scaffoldings erected all a the three western facets of the Deul, I begu close examination of all the figure sculpture the three western facets.

The perches on the scaffolding were very s as they were made with loose sheets of corrug iron lent by one of the potters in the hamle

On the southern half of three frontal the sculpture appeared to relate to the Ram story whereas on the northern half they appe to belong to the story relating to Krishna.

I had been intrigued by the animal I had taken at first sight to consis

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

row of horses, and as soon as the scaffoldings were high enough to reach this level (about 29 ft. above ground level) I climbed up the roughly cut bamboo posts of the scaffolding in order to catch a glimpse of this belt, cutting my leg badly thereby by the sharp edge of one of the bamboo posts, with the result that when I climbed high enough to get a glimpse of the lion belt my leg was profusely bleeding. All this was, however, worth while because what I saw of this belt filled me with an indescribable thrill and surprise. I discovered that the animals were not horses but lions—lions in the act of marching through lotus fields and of a virility of design, comprising a combination of ferocity, restraint and dignity, with their tails and manes stylized in a wonderfully plastic manner, the like of which I had never seen before in the sphere of art. Here, I felt, was undoubtedly the most outstanding feature of a structure which could not have been meant for anything but a Victory Monument.

The unique importance of the monument having been fully realized by me by now, I decided to extend my originally planned two days' stay at Nalia, so as to take a sufficient number of photographs and to fully examine all the plaques, understand their significance and make a record of all the architectural and archæological features of the Deul. For the next few days, therefore, I visited the Deul daily, going every day through the same laborious processes of the journey backward and forward, but performing it with zestful enjoyment for a cause the importance of which seemed to convert all these inconveniences into the pleasures of a picnic.

Further descriptions of this Deul from every aspect will have to be postponed to later articles; but before I conclude this first instalment, I should like to record my thanks to the local officers including Sj. S. C. Basu, P. W. I., Kaliagram station for lending his trolley, the Police officers who helped me in clearing the jungles round the Deul and in erecting the scaffoldings, to the zemindar Babu Harakumar Lahiri and his naib, and, above all, to Babu Ajit Kumar Mukherji, to whose instrumentality I owe by discovery of this important Deul, and to his hospitable father at whose house I made my camp for over a week while making my research. I am also indebted to Babu Sudhansu Ray, artist, who along with Ajit Babu helped me throughout cheerfully and enthusiastically in everything that I did during those days. I am also indebted to Babu Sudhansu Ray for making several sketches which are reproduced here and to Mr. K. N. Chatterji of *The Modern Review* and Sj. Nirmal Kumar Bose for helping me with many valuable suggestions regarding the description of the architectural features of the monument.

Foreseeing the possibility of vandalism commencing its operation after I had announced the importance of the monument, I requested the zemindar Babu Harakumar Lahiri of Korakdi on whose property the Deul stands, to take steps for its protection and he has accordingly kindly erected a strong bamboo fencing round it and has agreed to co-operate in protecting it from damage. In spite of the fencing, however, serious acts of vandalism have unfortunately occurred since then and I am informed that in open daylight some men actually went to the Deul with shovel and pickaxe and removed several valuable plaques and damaged others in spite of remonstrances from the zemindar's naib. I have been able to trace the person who has secured possession of the plaques so removed and I can only hope that these acts of vandalism will not be repeated. In my capacity as President of the Rural Heritage Preservation Society of Bengal I am requesting the District authorities of Faridpur to lend their co-operation in protecting this monument by giving instruction to the village police to help the zemindar's men in protecting it from further acts of vandalism until it is protected as I hope it will) under the Ancient Monument Preservation Act. It is obvious, however, that unless it is protected immediately under the Ancient Monument Preservation Act, there is every probability of this highly important monument of the greatest national importance to Bengal suffering irreparably grievous damage. I am making also representations to the Archæological Department with this end in view and it is hoped that the Department will take immediate steps in the matter.

INDIANS ABROAD

Indian Women in Malaya

Generally Indian women in Malaya are much more backward than their sisters in India, and that in educational and cultural walks of life. But in some other respects, local Indian women are much more broadminded than their sisters in India. For instance, the Indian women in Malaya make friends more easily and that in a natural way with the women of other castes and creeds or nationality. That is, of course, due to the cosmopolitan character of the population of this country. Further, my country women in Malaya are more tidy in their ways of living and they maintain their general standard of life on a higher scale than they do in India, although they are no better in these respects when compared with Europeans, Chinese or Japanese domiciled in Malaya.

Except the Indian coolie women, the other lass of Indian women immigrants here are educated and cultured. Most of them know the own mother tongue and quite a number kno English. The same cannot be said unfortunat of the Indian women born in Malaya, familie known as "Straits-born" Indian women. O members among them do not know how to read write any language, I mean in the majorit cases. And the younger set of Straits-born In women do not seem to show any keenness learn their own mother tongue but go in English education. Further, they very much l in them Indian culture or traditions. Just look the Indian orchestra, maintained by our L Club! All the eight or nine members take part in it are Indian born. It may be t we may have Straits-born Indian women in fut but they are not in it so far.

Further, the Straits-born Indian women do interest themselves in knowing past or pres events in India or for that matter in any c

Photo taken on the inauguration of the Lotus Club, Singapore. Ladies belonging to different provinces of India have become members of this club. Photo shows members with the Founder-President of the Club, Mrs. E. V. Davies, M.A.

part of the world. That is a grave mistake which needs to be remedied. Their illiteracy and conservatism in these respects are perhaps due to their close contact with the unprogressive Malaya women, whose languages and customs, the Straits-born Indian women have largely adopted.

I believe that useful education in some form or other is bound to improve their lot in course of time. They should keep themselves in touch with the activities of women in India, to which country they naturally look for inspiration. They should also read a lot of literature in their own language, such as Tamil and there are several good books in Indian languages and they could do a lot to open their eyes. With the right type of education the Straits-born Indian women can at least prove themselves better companions to their husbands. At present they are not efficient enough to talk on anything except rice and curry.

In their endeavour to "come up" in their lives these women need the help of their menfolks too. Perhaps there may be a few educated Indian women in Malaya who may be willing to give the lead but little can be accomplished without the sympathy of men. The Indian women do worship their husbands, though they may not die with them as they used to do, in the days of *Suttee*. Still they live for their husbands and they deserve every sympathy and help at the hands of Indian men in the F. M. S.

Singapore — Mrs. E. V. Davies

Kunwar Maharaj Singh speaks out

Here are a few extracts from a speech of Kunwar Maharaj Singh, Agent of the Government of India in South Africa, delivered to the Wesley Guild in the Wesleyan Church Hall, Boksburg:

UNTOUCHABILITY IN SOUTH AFRICA

"We Indians form one per cent of the total population of the Transvaal and you speak of us a menace.' How can one person in a hundred be a menace? You say that the Indian is a trader. Of course, he is. What else can he be? He cannot be an engine driver, or own land as he can in his own country. There is no country in the world—and I have travelled myself in over 30—where there are so many restrictions against Indians as this great country of yours."

After explaining the untouchability question in India and the great strides made within the last few months in abolishing the evil by the great reform work done by Mahatma Gandhi, the Kunwar went on to say:

"We are doing something for our untouchables, and the work which is being done in India will never go back. The reforms being carried out can never be negatived in the future. But what about untouchability in this country? In India, untouchability has a religious sanction, and you know how difficult it is to remove anything with religious sanction.

"But what have you done in your enlightened and progressive country, for it is truly progressive? I believe I have many sympathizers in this country, but they keep their sympathy hidden. I need open sympathizers. You are too timid, you have to take a little more action, a little more courage and you will find that what was bitter is sweet and what was sweet bitter.

"Teach your children not to despise people because they are five shades darker in colour. Everyone of the religious teachers of the world were men with dark skins—Moses, Jesus Christ—I have seen and known the classes from which they were born, Buddha, Confucius who has many millions of followers in China. What was his colour and what the shape of his eyes? Mahomed and all the great religious teachers were Asiatics, and—forgive me if I say it—were born and lived among the dark-skinned nations, the Asiatics."

We congratulate Kunwar Maharaj Singh for the brave stand that he has been taking against the racial exclusiveness of the white people in South Africa.

B. DAS

Indian Women Abroad

I do not know how far Indian women abroad have organized themselves to improve their status. From what I know, I find that there are not many women's organizations in foreign countries where our nationals live. And I may suggest here that just as menfolk, our womenfolks should also organize themselves in those countries to which they have emigrated. However, I would like to point out in this connection that an efficient Indian Women's organization is being run at Kobe, Japan, for the past few years under the guidance of an educated Indian lady in Japan, Mrs. Hassan Ali. The institution under reference here is known as the Indian Ladies' Club. In 1931, Mrs. Ali was also elected to be the President of the Kobe branch of the Japan Indian National Congress Committee. With the single exception of this organization, I had not known any other Indian ladies institution abroad so far.

Quite recently the example set up by the Indian women of Japan was followed in Malaya when a distinguished Indian lady domiciled in Singapore founded the first Indian ladies' club at Singapore. This lady is Mrs. E. V. Davies, M.A., a former Professor of Economics in one of the Women's colleges in Madras. The club is known as the Lotus Club. From very humble beginnings this club has grown into a very efficient organization with a membership of about a hundred. The members of the club meet every Saturday evening and discuss their activities and played games, such as, tennis and ping-pong. The club also holds an annual sports in which the members and their little children take part. Besides, an orchestra playing Indian music is also maintained by the club and to the functions held under the auspices of the Lotus Club, ladies of other races are also invited, so that they might get an idea of Indian womanhood.

Let us hope that the example set up by the Indian ladies in Kobe and Singapore will be followed by our womenfolks living in other foreign countries also.

FINANCIAL NOTES

By SAILENDRA NATH SEN GUPTA

The Report of the Bengal Jute Enquiry Committee

We have before us the Report of the Bengal Jute Enquiry Committee which was appointed just a year ago. The Committee was originally requested to submit their report by May, 1933, possibly because that would have helped the Government to decide its policy with regard to the 1933-34 crop. The volume contains three Reports, the Majority and the Minority Reports and the Report individually submitted by Khan Bahadur Azizul Huque. The last was not signed till December 22nd. There is also a supplementary note to the Majority Report by Mr. G. S. Dutt and two Minutes of Dissent, one by Dr. J. C. Sinha and the other (Note of Dissent) by Dr. N. C. Sen Gupta. There are also 221 pages of extremely valuable appendices.

The terms of reference were as follows:

(*i*) The question of regulation of the production of jute;
(*ii*) The marketing of jute, including the establishment of regulated markets, and the supply of market information in a suitable form to the producer;
(*iii*) The creation of a Jute Committee for the province of Bengal;
(*iv*) The extent to which other materials have displaced jute, and the likelihood of further substitutes being found in the near future;
(*v*) The possibilities of making any other economic use of jute to an extent that might relieve the present situation.

It was evident from the very beginning that no unanimity would be reached for it is too much to expect that representatives of conflicting interests would agree in fundamentals. This must have been known to the Government as well; and, it is rather strange that the Government after appointing such a Committee should itself declare that its decision would be delayed because of the lack of unanimity among the members. It is also significant that the officials and the Europeans have combined in signing the Majority report while the minority consists of all the Indian non-officials, who represent the principal commercial interests.

The Majority (with the exception of Dr. Sinha) have come to the conclusion that there is no over-production of jute and so there is no justification for compulsory regulation by legislative action. "Better organised and more intensive propaganda" should be carried out by collectors of districts to "assist" the cultivators "in deciding what area of jute is likely to secure them an adequate return for their produce (pp. 6-10). The Minority, on the other hand, consider that the depressed price of jute is due principally to over-production so that control of production is necessary. To this purpose they recommend that a Provincial Jute Committee be formed, which will estimate the probable demand for jute for the season and allot specified quotas of acreage to the different "economic blocks" into which the entire jute-growing area in the Province is to be apportioned. The allotment of the quotas will be carried into effect by local agricultural associations or other agencies for the formation of which active steps should be taken by the Government through its various departments. The minority does not contemplate legislative action in the initial stage (pp. 85-105). Both the Reports have made recommendations for more efficient determination of the estimated productions and publication of the forecasts, so that there might be an end to undue speculations (pp. 11-12, 106-110). The minority record that the official forecasts are inaccurate and "instead of being helpful to the trade, they often mislead the market, causing violent fluctuations and speculation (p. 159). Both the reports agree that weekly and fortnightly reports in addition to the preliminary and final forecasts will be of great help in checking speculation.

Both the Majority and the Minority agree that all "allowances" should be abolished and that "standard" weights should be universally used. They also agree that regulated markets should be established, initially on an experimental basis at selected places. While the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Minority recommend that a special legislation on the lines of the Central Provinces Cotton Market Act of 1932 is necessary, the opinion of the Majority is divided as to whether or not legislation is needed (pp. 26-27, 116-118, 122-23). The Minority recommend the establishment of licensed ware-houses as will enable the cultivators to deposit their stock and to get temporary accommodation by discounting the ware-house receipts with money-lending agencies. Such ware-houses may initially be established on an experimental basis (pp. 128-131).

While the majority is divided as to whether or not future markets are necessary, the minority hold that there is a real need for a future market in jute and gives the necessary details for the establishment and regulation of such a market (pp. 28, 135-139).

The opinion of the Majority is divided as to whether the proposed Jute Committee should be Central or Provincial. The Minority unanimously prefer a Provincial Committee. The Majority Report recommends that the function of the Committee should be advisory while the Minority Report holds that it should be invested with effective powers of control over the trade as a whole (pp. 30-39, 149-56). The constitutions of the Committee as suggested by the two Reports are widely different (pp. 34-39, 154-55), and the Majority is not unanimous on this point.

The Majority finds (p. 39) that the Jute industry is being seriously threatened by increased adoption of bulk handling and substitution of jute by paper and cotton. They recommend that a policy of research with the object of discovering fresh markets and new uses for jute should be vigorously pursued. So also agricultural researches should be carried on for improving the yield or quality of jute or both. The Minority, while alive to the danger, concludes that it should not be exaggerated and recommends the establishment of a research organization by the jute mills. The Minority also points out the "disproportionately wide gap between the harvest price of jute and the price of jute manufactures" and holds that "an attempt must be made by the mills to reduce the cost of jute goods" (pp. 39, 142-47).

Such are in barest outlines the main decisions of the Committee. The Majority Report is more or less a slipshod affair. The arguments are not well put, there are no quantitative informations to carry conviction, all the aspects of this industry have not been discussed and the report as a whole display an entire lack of scientific perspective. It is noteworthy that Dr. Sinha signed the Majority Report, though his views as given on pp. 6-7 and in his Minute of Dissent are entirely at variance with the Majority Report on many of the most essential points.

Though we do not see exactly eye to eye with the Minority Report, we are almost in entire agreement with it. It is a very ably written, well-reasoned and well-balanced report where arguments in striking contrast to the Majority Report are given not in the form of dicta but are supported by a mass of facts, figures and statistics which cannot but impress any serious student of vital problem of Bengal's economic life.

The Dollar and the Recovery

The economic history of world for the last few months is largely the history of Mr. Roosevelt's recovery programme. It was found that the Banking crisis in America was mainly due to the "almost impossible situation presented by the overwhelming indebtedness of America as expressed in national and municipal indebtedness and in the indebtedness of farmers and other large sections of the community." The details of the programme are well known. The President has sought to improve the situation in three ways. He has sought to rationalize agricultural production by vesting large powers in the hands of the Secretary of Agriculture and to ease the agrarian indebtedness by providing huge mortgage loans at a low rate of interest. He has sought to force up the price level by inflationary means and by providing more purchasing power through the operation of the Reconstruction Finance Corporation, Emergency Public Works Administration, Federal Emergency Relief Administration and similar projects. He has sought to restore the equilibrium between consumption and production through the National Industrial Recovery Administration which provides for higher wages, shorter hours, recognition of trade unions by voluntary agreement if possible or by compulsion according to the "Blanket code" of July 24th in other cases.

On April 20th, an embargo was placed upon gold with the result that the price of the dollar fell and the exchange markets were, for

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

a time, put into utter confusion. The prices rose in U. S. A. sharply till July after which there has been a sharp recession. The trade activity received considerable stimulus and a fairly substantial reduction in the number of unemployed was effected. To bring about the the necessary forcing down of the dollar, Washington has begun to bid for gold in foreign markets. This naturally has a disturbing effect on foreign centres due to huge withdrawal of gold. The country most affected is naturally France, the only important country still on the Gold Standard. The price of gold for some time remained absolutely uncertain. Till January 25, America was purchasing gold at $ 20.67 per oz. but on that date the rate was increased to $ 34.45 per oz, the effect on the bullion market being disastrous. On February 8th the rate was further raised to $ 35.00 per oz. and simultaneously the President made an announcement fixing the dollar value in terms of gold and so putting an end to the hectic conditions prevailing in the exchange markets. It has been announced that the dollar will henceforth have 59·06 per cent of its old gold contents (*i. e.*, it will contain 15^5/$_{21}$ grains of gold ^{9}/$_{10}$ths fine) and that the price of gold will be 35 dollars an ounce with effect from February 1st. This new valuation will mean a profit of about 2880 million dollars to the Treasury. The embargo on gold will automatically disappear.

In almost every case of exchange depreciation, the rise of prices is markedly less than the depreciation in the exchange value of the depreciated currency. This occurred when the sterling first depreciated and is true in the present case also; the internal value of the dollar is much higher than its external value. There appears, therefore, apart from the effect of price movements in other countries, to be a substantial margin by which prices might still rise in the United States before the internal and external prices are in equilibrium. The reason for this disparity is that speculation is active in foreign exchange and fears of further depreciation induces forward selling. The following tables will make our point clear.

TABLE I

1933	(1) Dollars to £	(2) Francs to £	(3) Dollars to £ Index Jan. 1933=100	(4) Francs to Dollars Index Jan. 1933=100
Jan.	3.37	86.06	100	100
Feb.	3.42	87.22	101	102
Mar.	3.44	87.40	102	103

Aug.	4.50	83.88	134	131
Sept.	4·66	80.35	138	128
Oct.	4.67	80.22	138	128
Nov.	5.14	82.14	153	146
Dec.	5.14	83.68	153	146

Note: Series (1) and (2) are from the "Economist" series (monthly averages). Series (3) and (4) are derived from (1) and (2). The figures are approximate.

The abrupt rise in May is due to the suspension of the gold standard on the 20th April. The rise in June is explained by the enactment of the N. R. A. on June 16, and the rejection of proposals for currency stabilization by the U. S. A. delegates to the World Economic Conference (June 22-27). In July also rise is due to the failure of the Economic Conference. In November, there was a change in the personnel of the Roosevelt Government and a more inflationary policy was indicated. All these led to violent speculation in the exchange market. Had there been no speculation the movement of the internal prices would have been more or less parallel to the movement of the external price of the dollar. The disparity between the two, as seen from the following table, will roughly measure the rôle of exchange speculation.

TABLE II

1933	(1) Index No. of wholesale prices 1914=100	(2) Index No. of wholesale prices Jan. 1933=100	(3) New York-Paris cross rate Jar. 1933=100	(4) Internal value of dollar as percentage of external value (4)=(2)÷(3) ×100
Jan.	87·4	100	100	100
Feb.	85·7	98	102	96
Mar.	86·2	98	103	95
Apr.	86·5	99	105	94
May	89·8	102	116	88
Jun.	93·1	106	123	86
Jul.	98·7	113	137	83
Aug.	99·6	114	131	87
Sept.	101·4	116	128	91
Oct.	102·0	117	146	91
Nov.	101·9	117	149	78
Dec.	101·6	116	..	..

The fourth column shows how the internal value of the dollar has failed to keep pace with the rise in its external value. The depreciation of the dollar was doubtless designed to raise the internal price level. The latter continued to rise no doubt but the exchange value rose more than in proportion due to speculative influence which had little direct effect on the internal price level itself.

It might be noted that the new gold parity yields about $ 6.66 to 100 francs and at 78.84 francs to the pound (the actual rate on 20-2-34) the rate should be 5.127 dollars to the pound. The actual London-New York rate is 5·13 dollars to the pound. For some time the rate has been below the theoretical rate due to heavy shipments of gold induced by the higher dollar price.

PRICES

The various Index numbers for the United Kingdom are as follows. The series has been reduced to the base 1933 Jan.=100 and only the nearest integer is used.

1933	102·4	101	104	102

It appears from (4) that the "Economist" ndex is generally in excess of the "Statist" index nd in defect of the "Board of Trade" index. hus the average of the three is almost identical ith the "Statist" index which therefore we take s the most "reliable." We are aware of the eoretical difficulties involved but since we use e indices merely as indicators, the nicer points echnique are best left alone.

A comparison of the "Statist" index with the . S. A. index of wholesale prices will show that e course of prices in general in the United ngdom roughly follows that in U. S. A. but h a far less amplitude since the passing of . R. A. From a study of these indexes ne, we think it is yet premature to predict a peful time ahead. Had the improvement of spring time continued, we would have been stified in forecasting prosperity in near future. Germany, however, we see definite improvement how far that is due to the remission of the ge reparation payments, it is too early to ble. In the following table, the indices have en reduced to the base Jan, 1933 (nearest tegers).

Nov.	105	98	94·5	100	117
Dec.	105·5	98	94	100	116
		100	93·5		

Note: The above table is calculated from Stat. Gesampt in case of Germany, Stat. Gen's index in of France and Prof. Bachi's index in case of Italy. case of India, the official Calcutta index has been d.

It is evident that if the Index number of wholesale prices is any criterion of national prosperity or otherwise, there has been a steady improvement in Germany where the rise, though not remarkable, has been continuous and steady. In France, there was some improvement during the autumn but the improvement has not been maintained. In November, there was some rise no doubt but it is too much to say that this is the sign of a "definite revival" in France. In India, the downward trend of prices was checked in May when our Index Number rose from 95 to 100. Since then the price level has remained remarkably steady. It is remarkable that in each of these countries the "revival" set in in the month of May. As this concides with the introduction of the "Recovery" policy of President Roosevelt, it is not unlikely that the so-called "recovery" is merely an international effect of the American experiment. The case of Italy is a bit peculiar, since here we find the price-level going lower and lower steadily. There was no improvement whatsoever even during May when all the other countries registered a rise in the price-level.

In some respects the Cost of Living index is a more important indicator of the actual economic position than the wholesale price index. In normal conditions the index of wholesale prices and the cost of living should move together. In case of disequilibruim, the two will in general diverge but the divergence by itself would not directly *measure* the disequilibrium. The most obvious reason of the divergence is the disagreement between the movement of prices of industrial and consumption goods. In the following table we give the cost of living indices of U. S. A., Germany and the United Kingdom. In each case, the indices have been reduced to the base Jan. 1933=100, to facilitate the study of the variation during the year. We have no cost of living index which is applicable to the whole of India For this reason, we have not included the Bombay Bureau of Labour Index.

The rise in June in U. S. A. is only as expected due to the introduction of the Recovery Campaign. It is also interesting that the upward movement of the Index has begun simultaneously in both the United Kingdom and the U. S. A. and has been maintained in both the countries since then. In Germany however though the wholesale prices were rising, the cost of living was steadily falling during the year. It will be seen from the following table that in every case, the cost of living has lagged behind the wholesale prices. This is only natural since in the former we take account of retail prices which are much less affected by speculative influences than the whole-sale prices.

TABLE VI

The wholesale prices Index in terms of the cost of living Index. (Jan., 1933=100)

1930	108	112	...
1931	102	101	...
1932	104	102	...

This index shows, therefore, that so far as the ratio of wholesale prices to the cost of living is concerned, the position of U. S. A. was the same in September 1933 as it was in 1930. So far the "recovery" is remarkable. In case of the United Kingdom, the position is no better than it was on the average during 1932.

INDIA

So far as the prices are concerned, we have seen already that the wholesale prices index has remained more or less constant during the past few months. Like most other countries in the world, the recent events in the United States of America has profoundly influenced the economics of our own country as well. The gold movement which began in 1931 on a large scale has continued unabated since then, receiving fresh impetus from the depreciation of the dollar. Our rupee being "linked" with the sterling, the Rupee-Dollar exchange has closely followed the Dollar-Sterling rate. Along with other countries, the import and export trades of India will no doubt be seriously affected by the depreciation of the dollar but as such effects are remote and mere or less indirect, the actual amount of disturbance caused by this exchange tro cannot be ascertained now.

Our position in International Trade is tinctly better than it was in 1932. While exports have increased our imports have dimini ed, so that our balance of trade has impro considerably. There has been a distinct provement in the Tea trade. Both in demand for internal consumption and in the price offered the improvement has been rem able. It seems that the restriction plan ag upon by the various tea-growing countries worked very well. In the Jute industry, paratively higher prices of hessians have throughout the year 1933. The result has that while the export of raw jute has consider increased, that of jute manufactures has remi more or less constant. Japan is increasing Jute mills and unless proper precautions taken she will very soon become a formi competitor in very near future.

As regards cotton and cotton manufa events of far-reaching importance occurred d the past year. The depreciation of the lowered the price of Japanese piece-goo India and in defence of the home industry was very seriously affected, the duties on Japanese cotton manufactures were increas 75 per cent. Japan boycotted Indian cott retaliation. It is now well known how a gation was sent out to India by the Jap Government to discuss the situation wit Indian interests and how after a prol negotiation a settlement was arrived at October, 1933. A Tariff Bill incorporating Indo-Japanese Agreement and the Modi Pact differentiating in favour of the United dom is now on the Legislative anvil. Indo-Japanese treaty itself has not, however, signed yet. The Tariff Board Report on Cotton Textile Industry has been issued recently and must be considered out-of-d view of these developments. Inspite o Japanese Boycott, the export of raw cott considerably increased. The price of cotton soared up during June but following crisis in America it has again come down

An event of some interest which considerable flutter in the Calcutta mark the temporary recrudescence of the old controversy. The controversy had its nature when the Legislature refused to consid devaluation of the rupee in terms of the st

As regards the price of gold, *The Economist* noted in its January 29 issue "there is not much possibility of gold further unless fresh developments occur." developments did occur. During the week on January 27, the price of gold per tola from Rs. 32-8-0 to Rs. 32-10-9. Following new development of Roosevelt's Gold Po Bombay gold rate which closed at Rs. on January 31, touched Rs. 35-2-0 on

February. On the fifth, the rate lowered down Rs. 34-8-0. During this period the record ice of £ 7 was reached in London. Since then price of gold has come down and for the last days the ruling rate has been in the neighbourd of Rs. 34 per tola (137 s. in London).

The export of gold on large scale which began en the Gold Standard was suspended continues since October 1931, Rs. 184.50 crores worth gold has been exported from India. The lowing table gives the value of gold exported each month since October, 1931.

e shall now consider India's International during 1933 in some detail. The total of merchandise during that year amounted 148.3 crores which is 7.3 per cent higher the 1932 figure of Rs. 138·17 crores. The s have decreased in the same time by per cent from Rs. 133.65 crores in 1932 116.05 crores in 1933. This cannot ly continue for ever, but the longer such ation continues the more will our country Considering the export and import together, we find that our total foreign has declined by 2.9 per cent from 2 crores in 1932 to Rs. 264.35 in 1933.

TABLE IX

Foreign Trade of India
(in lakhs of rupees)

January 1933	20043	6340	11687

THE RATIO CONTROVERSY

It is not possible here to examine thoroughly the claims put forward by the two sides. The controversy had a temporary recrudescence for some time and as in 1926 we had several long statements made by eminent publicists on this old problem. The main issue was to determine whether the rupee is overvalued in terms of the sterling. The supporters of devaluation tried to prove their point by referring to the decline in the Balance of Trade and in the export trade and in wholesale prices. Without entering into the controversy itself, we would like to say that the exports, imports and therefore the Balance of Trade are not separate entities by themselves. For instance, in India the jute and tea industries contribute about 20 per cent of the total exports. A depression in these two industries alone due to factors peculiar to them will lead to a fall

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

in the exports more than in proportion to the general decline due to world causes. It is clear that it would not be correct to attribute the fall to overvaluation of the currency. Similarly the particular causes affecting one or two important industries might show the total exports or imports of other countries in a light more favourable or otherwise than they really are. It is therefore dangerous to base one's argument on the statistics of international trade without eleminating the effects of the peculiar circumstances affecting the more important industries a country. In the next place, so far as we judge, the only reliable and safe criterion to out whether the currency of a country is o valued or not is to examine how far the cost living and wages have adjusted themselves to value of the currency. Unfortunately, criterion is not suitable for investigation in I where no universal cost of living index is existence and where the wages-system is unorganized to allow of any accurate compari

THE AGONIES OF BENGAL

By A. C. GUHA

By a strange irony of fate, Bengal, which, in the heyday of her glory, outshone all other provinces in the vast Indian peninsula, has now fallen on evil days.

Bengal's misfortunes began with the Partition of the province in 1905 which subjected her to extensive amputations and reduced her strength to half of what it was before. In the event of a re-union between Hindus and Moslems who live side by side and cannot have many separate interests, they could by common consent secure a constitution adapted to their mutual needs.

Next after the Partition came the Meston Settlement to deal Bengal a knockdown blow. It left her so stranded that she, formerly the richest of provinces, is now unable to pay her way. It diverted from the coffers of Bengal to those of other provinces about 50 crores of rupees, the cumulative proceeds of the export duty on jute grown almost exclusively by her agriculturists. An unprecedented slump in the jute market followed and all but killed the most flourishing industry of the Province.

As if anything, remainded to complete the picture of Bengal's disolation, hundreds of thousands of her men and women were thrown out of employ and simultaneously with this, terrorism rapidly gained ground within the last year and a half. This last catastrophe has paralysed Bengal's political progress.

This long list of misfortunes, heavy beyond endurance as it is, by no means exhausts the catalogue of Bengal's woes. The last Ce has revealed that the population of Be has increased 8 per cent within the decen which ended in 1931, while her food reso have remained stationary. This may turn to be the proverbial straw on the Be Camel's back. If the country is starve death through shortage or failure of supplies, not a vestige of the Bengali race remain to enjoy the blessings of Swaraj it comes. The writing on the wall is vis and if Bengal or any other part of India no heed to it, it will only precipitate the of judgment and "plunge her headlong bottomless abyss."

Apropos of India's food situation, Linlithgow, the foremost authority on I agriculture says :

> "India's political problems, anxious and as they are, *are as dust* when weighed aga problems of the future food supply of ever growing millions."

Yet we in India are too busy constitution building, to think of any else, even though it be a matter of li death to us.

Already, malnutrition and undern have exacted a heavy toll and produced natives of Bengal a chronic predisposi wasting diseases such as Beri Beri, culosis and others—too numerous to be

Recently Sir John McGaw, D General of Indian Medical Service, awake philanthropist and physici eminence, has drawn a most lurid pi

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the gloomy conditions which prevail in Bengal and of the worse which cloud her future. Another authority, Mr. Porter, Superintendent of the last Census, no less eminent in administrative economics than Sir John in medicine, and whose official position gave him an opportunity of investigating up-to-date data at first hand, made some highly relevant observations on this subject, which we make no apology to reproduce.

"Any increase of population must lead to increased distress, unless the potentialities of the province are developed. Like the rest of India, Bengal is notable for its undeveloped resources and the insufficiency with which such resources as it has, are exploited. If the total cultivable area, only 67 per cent of which is now actually under cultivation, were brought under cultivation and if improved methods of cultivation, yielding an increase of 30 per cent over the present yield, were adopted, it is clear from a simple rule-of-three calculation that Bengal could support, at its present standard of living, a population nearly twice as large as that recorded in 1931. It is clear at least that it is not yet time to indulge in gloomy fore-bodings on the ground that Bengal is over-populated, provided full use is made of the available resources of the country."

Mr. Wilkinson, the well-known author of "The World's Population Problems" has come to pretty much the same conclusion as Mr. Porter has. He observes :

"The Indian peoples have in their agricultural resources alone, sufficient potential power of production, to support any increase of population which is likely to take place within the next hundred years."

But, unless agriculture is vastly expanded and every inch of cultivable but now uncultivated waste, brought under tillage, Bengal's situation will be like that of Tantalus of days of yore.

While the people of India are indifferent to their own agricultural interests, prominent statesmen abroad have often stressed their paramount importance. It was, perhaps, a conviction of this nature which prompted the British Government to send out to India a former Viceroy to succeed a lawyer and simultaneously, to appoint a Royal Commission on Indian agriculture. It is a pity that out there in India, we are slow to take advantage of the opportunities placed within our reach. The apathy towards agricultural interests and preference for political ideals is all the more lamentable as the latter often leads to will-o'-the wisps and tends to bring into dangerous prominence the many fissiparious tendencies that divide castes, sects and communities in India. It is for this reason that the late Viscount Milner advocated the formation of a national party which would assign the foremost place in its programme to the fostering of agriculture. The Great War has conclusively shown that food supply is more important than torpedos and aeroplanes. In these circumstances, the only salvation of Bengal lies in the expansion of her food resources and agriculture.

It behoves us, therefore, to go back to land in the first instance. It is fortunate that the undeveloped agricultural resources of Bengal are large.

According to official estimates there are extensive areas of immediately cultivable but uncultivated wastes to the order of nearly six million acres, exclusive of forest, current fallows and land not suitable for cultivation. The area is equal to barely an eighth of that which is cropped and it is incumbent on every real patriot to see that every inch of this virgin soil, which has the advantage of being free from diminished returns, is brought under tillage. To do this would however require a mint of money but it could never be better spent than in easing the economic pressure on the people of Bengal which may lead to absolutely disastrous consequences later on. Not to speak of starvation which the shortage of food supplies would involve there is just at present more than half a million of the unemployed in this country and the Government has absolutely no excuse for withholding the necessary capital for developing agricultural resources which would provide food and work for them. Great Britain is spending one hundred thirty million pounds per annum for feeding its workless, "with nothing to show for it" as observed by Mr. Lloyd George. The United States of America is pouring out something like £80,500,000 per annum on unemployment benefits, over and above gratuitous relief. A mere fraction of the amount spent by either country would rescue millions in Bengal from the jaws of death. The first and foremost concern of the State is to keep its subjects above bodily want and the neglect of this function would be a voluntary abdication of the most essential prerogative of sovereignty and a flagrant

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

breach of the contract which it has made with the peoples who placed themselves under its care. It is sad to think that funds are forthcoming for absolutely unproductive and unnecessary expenditure, while none is available for this fundamental need of Government.

I would suggest a short and simple method of raising money for this purpose. In the money market of today, it is the easiest thing for the Government of India to raise a loan, say, of one crore of rupees and to place this sum at the disposal of the Bengal Government for distribution among men, preferably among *Bhadraloks* who would undertake to reclaim cultivable wastes. I understand that Sir Daniel Hamilton signified his willingness to guarantee the repayment of this loan with interest at the rate 5 per cent per annum. This would enable Government to earn 5 per cent on money locked up in idle reserves.

An alternative to the method suggested by me, perhaps a preferable one, is the expansion of currency to meet an extraordinary but urgent demand. Both the League of Nations and the expert MacMillan Committee favour this alternative.

From the budget speech of Sir Ge... Schuster, it would appear that there is ... a possibility of finding money for capital ... productive expenditure and it is a pity ... Sir Daniel's offer was allowed to fall thro... But I hope it may be revived, if the Gov... ment of Bengal takes an interest in ... matter.

The Central Government should, in ... fitness of things, now disgorge the crore... rupees which it took from the coffers ... Bengal and should distribute the amount ... loans to Bengal agriculturists to enable th... to pay old debts or to contract new ones ... developing new areas. This is the m... effective means of relieving rural indebted...

In conclusion, I fervently hope that a ... policy of dealing with unemployment ... terrorism, by acquiring waste lands ... parcelling them out among the middle cl... of Bengal, on whom the brunt of econ... distress has fallen, will be inaugurated. ... the proposed relief of economic tension, ... unemployment and terrorism would d... natural death in the course of time.

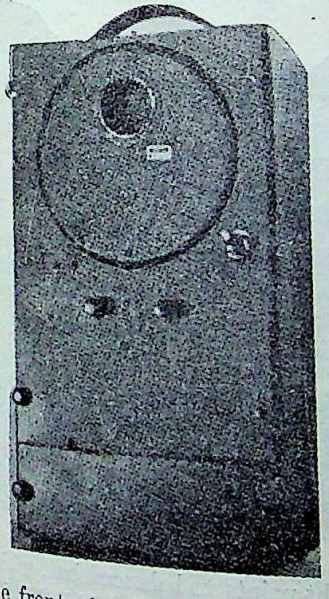
GLEANINGS

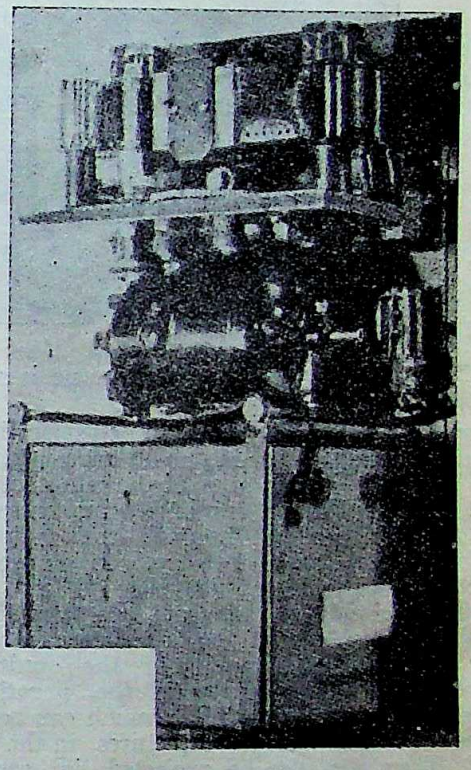
Criminals Photographed in the Act

Positive indentification is the weapon most feared by organized crime and the ruthless criminal. Efforts have therefore been made for many years to produce a workable camera which would photograph the hold-up while the act is being committed. Now with the aid of especially fast film and very efficient lenses the problem of doing just this seems solved. Universal focus and ample field of view of the lens are of course essential to success. The problem is a hard one and considerable equipment is required; anywhere from one to five cameras are used so as to photograph the hold-up from various angles. The system is intended primarily for banks, other institutions that pay out or receive considerable sums of money, and jewelry stores.



The front of the concealed camera

The cameras are concealed at strategic points by grillworks or other masking devices and may be started in operation in a number of ways which will not attract the attention of the bandits. Once the cameras start, a complete record of the robbery is secured. It has been determined that the average hold-up occupies only about three minutes. Each camera will make 240 exposures for each loading and it takes 12 minutes to run off the film. The exposures occur at regular intervals of approximately three seconds. This is sufficiently frequent to follow the acts and movements of all parties concerned. Three exposure-time values are repeated consecutively, one of which will be approximately correct for the existing illumination at the time the camera is in operation. Of course the more light the better, but there will often be cases where the light will be comparatively dim. Under normal illumination of about five foot-candles of light reflected from the object, the shortest exposure used will produce identifiable pictures. Under low illuminating values the longer exposures will produce recognizable pictures down to one foot-candle of light reflected from the object.

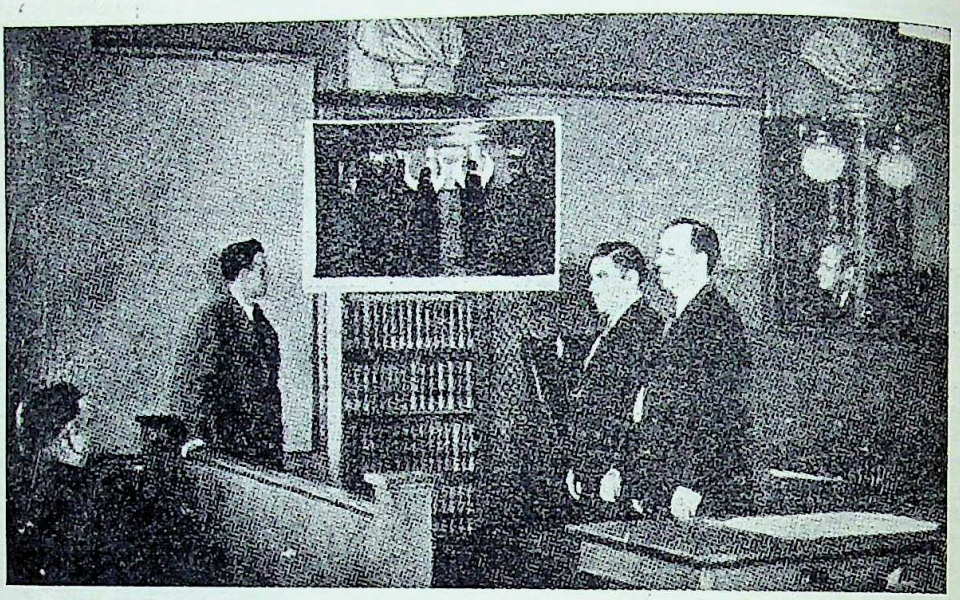


The mechanism is operated by batteries; even if cables are cut the camera continues to work

A scene at a hold-up. "Hands up!" is a too well-known slogan. The bandits are being photographed by the concealed silent camera

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri



The scene is reproduced on a screen in court

The system is inaudibly started electrically, and when once started there is no stopping it. If the bandits should discover one of the wires, or if they were cut in an inside job, nothing can prevent the cameras from functioning, even the lens is protected by bullet-proof glass. Naturally the cameras must have motors to drive them, but they do not depend on an outside circuit and they are all driven by dry batteries so they cannot be disabled by cutting, shorting or destroying any part of the outfit. After the exposures have been made the negatives are developed and positives are made which can be utilized by the police in comparing the pictures in the "rogues' gallery." They may also be projected in court and there is a good prospect of re-enacting the crime. Two of our illustrations show a photographed hold-up where the victims are faced to the wall, and the same scene being projected in court for the benefit of the judge and jury. The system is known as the "Oshkosh Photo-Identification System."

Valve Cuts off Gas in Quake To Prevent Explosions

For the prevention of fires and explosions during and after earthquakes, a safety valve has been produced for shutting off gas or electricity. It works by means of a bronze ball mounted on a supporting stem. Only a vibration sufficiently strong to damage a building can shake the ball from its stem, causing the valve to cut off gas or power supply.

NOTES

Trial and Imprisonment of Pandit Jawaharlal Nehru

In the course of "The Last Letter" written by Pandit Jawaharlal Nehru from prison to his daughter, which was published in our last issue, he said :

"I have been a dabbler in many things : I began with science at college and then took to the law and, after developing various other interests in life, finally adopted the popular and widely-practised profession of jail-going in India !"

When he wrote those lines perhaps he did not *definitely* know that he would soon be given an opportunity again for the practice of his profession, though he must have had vague anticipations. For when he was arrested at Allahabad on the 12th February last, seeing the police, the Pandit said smilingly, "I was looking out for you for some days."

In the last paragraph of "The Last Letter," the Pandit wrote :

"We have finished, carissima, and this last letter ends. The last letter ! Certainly not ! I shall write you many more."

He knew not how soon he would be at leisure to write a fresh series of letters to his daughter from prison.

After his arrest at Anand Bhawan in Allahabad Pandit Jawaharlal Nehru was brought down to Calcutta for trial, as the three speeches which were considered seditious had been delivered in this city. Two of the speeches were delivered in English in the Albert Hall on the 17th and 18th January last and one in Urdu at Maheswari Bhawan on the 18th idem. The Pandit was tried in the court of the Hon'ble S. K. Sinha, Chief Presidency Magistrate, Calcutta, who framed a charge against him under section 124A of the Indian Penal Code (sedition). He was offered bail but did not accept it. Being asked by the court to plead to the charge, the Pandit said he would not make any plea, nor would he take any part in the proceedings. But with the permission of the court, he made a statement, in the course of which he said :

> "As regards the two speeches delivered by me at the Albert Hall on January 17 and 18 last, I should like to congratulate the reporters for the very good transcriptions submitted by them. There may have been some minor omissions here and there but that was inevitable as I spoke very rapidly and extempore. On the whole, these reports are substantially correct and do represent what I said. But I am afraid, I cannot extend similar congratulations to the reporters who reported my speech at Maheswari Bhawan. Anything more scrappy and incomprehensible I have seldom met. It seems Urdu and Hindi as they are spoken and written in Bengal are very different from what they are in my part of the co..ntry. The speeches delivered by me may have been seditious or not, but they certainly contained some logic and sense. This report of my speech is sheer nonsense and does less han justice to me."
>
> In regard to the matter contained in the speeches, Panditji admitted that not only in these speeches but for many years before this his activities had been seditious.
>
> "I should like to express my gratitude," Panditji continued, "to the Government of Bengal for the opportunity they have accorded me by taking these proceedings against me to associate myself in a small measure with the past and present lot of the people of Bengal. That is a privilege I shall long treasure."
>
> He was stopped by the court from proceeding further while he was saying that his two speeches at Albert Hall were largely concerned with events in Bengal—in Midnapur, Chittagong and elsewhere.

The above is the newspaper report of a part of his statement. Part of it is also referred to in the judgment of the Magistrate, given below, and that should be considered authoritative. The Magistrate's judgment was as follows :

"The accused Pandit Jawaharlal Nehru has been

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

charged with having delivered three seditious speeches, the first at the Albert Hall on 17-1-34, the second at the same place on the following afternoon and the last at Maheswari Bhawan, a public hall in Sovaram Basak Street, the same evening. The first two speeches were delivered in English and the last one in Urdu. Government reporters who attended these meetings took short-hand and longhand notes of all the speeches. Transcriptions were made thereafter, as also an English translation of the speech in Urdu. The accused admits the correctness of the report of the first two speeches; he has stated that they represent substantially all that he said on those occasions. The report of the third speech, however, he states, is somewhat of a travesty of his utterance. As this last speech is mainly a repetition of what he had said on the two previous occasions, it is unnecessary to enter into the alleged inaccuracies of reporting.

"The meeting at the Albert Hall on 17-1-34 was convened to voice a public protest against excesses committed by the troops in their route marches in the district of Midnapur. The second and third public meetings were held with the object of discussing the present political situation in India and the duties of the Indian people.

"In view of the statement made by the prisoner in pleading to the charges, it seems to me it would be altogether superfluous to discuss a single line of any of the speeches. The accused has stated in Court that for many years his activities have certainly been seditious if by sedition is meant the desire to achieve the independence of India and to put an end to foreign domination; he has laboured to that end with all his strength for many long years; as the years go by, his conviction has grown stronger within him that there can be no freedom for the Indian people so long as there is a trace of British rule left on the face of the country; he has, therefore, attempted in a small degree to put an end to British rule in this country; if that is sedition, he admits he has been seditious for many years.

"A cursory perusal of the speeches shows that they are animated by an implacable hostility to the established Government. In the first speech reference is made to recent events in the district of Midnapur. The speaker sees in the measures taken by Government to restore law and order in that province nothing but the attempt of an arrogant Imperialist power to humiliate not the city of Midnapur, not the few people of the district but the whole of India, because it is a matter of humiliation to every Indian from the Khyber Pass to Cape Comorin. For this he attributes the blame not to any individual or group of individuals but to a system, a cruel and vicious system that afflicts all who adapt themselves thereto; it is this machine, he says, that crushes the whole country. He goes on to speak of the innate and inherent vulgarity of Imperialism, its utter cruelty and its vandalism, its shamelessness, its callousness. There is a good deal more in the same train.

"It seems superfluous, in the face of all this, to observe that the speeches in question are highly seditious. The speaker's intentions are avowed and admitted.

"I find him guilty under Section 124-A I. P. C. On the first charge he is sentenced to undergo two years' simple imprisonment. No separate sentences are passed on the other two charges.

"The prisoner will be placed in Division I."

It would serve no useful purpose to discuss whether the Pandit's speeches were seditious or not. Nor has the full text of the speeches been published to enable either lawyers or the lay public to arrive at any conclusion. Section 124-A of the Indian Penal Code is wide and elastic enough to rope in any criticism which is not in effect a petition in disguise. No criticism worth the name of which the Government is subjected is ever indulged in in order to rouse affection for the Government or the opposite of the feelings of hatred or contempt. This is, of course, the commonsense view of the Section. But even distinguished Judges of Indian High Courts have differed in their interpretation and enunciation of the law of sedition in India. No doubt, the original intention with which the section was drafted was different. It was made clear by Sir James Stephen, who was Law Member of the Government of India in 187[illegible] in one of his speeches, in the course of which he said that "the offence would fall under the Section if only there was a disposition to resist the law by force. So long as a writer or speaker neither directly nor indirectly suggested or intended to produce the use of force he did not fall within the sedition section."

We were among those present in the Albert Hall when the Pandit delivered his speech on what had been alleged to have been done at Midnapur during the route marches of troops. It would be considered presumptuous if we said that that speech did not strike us as seditious, but we can certainly assert that there was not in it the remotest suggestion of the use of force to put an end to imperialism or British domination in India. And we are certain that the other two speeches were equally free from "violence." For the Pandit is not a hypocrite, and he condemns terrorism in quite unequivocal language in a students' meeting in the course of his brief visit to Calcutta during which he made the three speeches complained against.

Part of the Chief Presidency Magistrate's judgment runs as follows:

"In view of the statement made by the prisoner in pleading to the charges, it seems to me it would be altogether superfluous to discuss a single line of any of the speeches. The accused has stated in Court that for many years his activities have certainly been seditious if by sedition

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

meant the desire to achieve the independence of India and to put an end to foreign domination; he has laboured to that end with all his strength for many long years; as the years go by, his conviction has grown stronger within him that there can be no freedom for the Indian people so long as there is a trace of British rule left on the face of the country; he has, therefore, attempted in a small degree to put an end to British rule in this country; *if that is sedition, he admits he had been seditious for many years.*"

This extract from the judgment shows that the Pandit's admission that he was seditious was conditional, the conditional words being those which we have italicized above, and his admission was not made specifically with reference to his three speeches complained against but with reference to his political activities for many years past. Now, in our opinion, as the charge against him was based upon his three speeches, it should have been shown that *these* were seditious. This has not been done. A general and conditional admission should not be made the ground for conviction for an alleged offence on a particular occasion.

As regards Mr. Nehru's conditional admission, it can certainly be said of *all* leading Congressmen, if not also of a large number of the rank and file, that they also have been trying for more than a decade "to achieve the independence of India and to put an end to foreign domination." If placed in the dock, they will all admit with the Pandit that for many years their activities have certainly been seditious, *if* endeavours like those made by them be seditious. In that case all these Congressmen would deserve lifelong imprisonment on the ground of that conditional admission.

Nor would the sentence include Congressmen alone. All the leading Moderates want Dominion Status. Dominion Status implies that the Dominions are equal in political status to Great Britain. Every Dominion—be it Canada, or Australia, or South Africa, or the Irish Free State, or New Zealand—would repudiate the assertion if it were said that the Dominions were *under* British *rule*. They are under self-rule. They are *equal* partners in the British *Commonwealth* of Nations, *not* subject states within the British *Empire*. Therefore, whoever wants Dominion Status and works for its attainment, works for putting an end to foreign domination, British *rule* and imperialism. However remote Dominion Status may be, it has been admitted to be a legitimate goal by Lord Irwin as Viceroy and other British statesmen. We do not think the Government would be prepared to imprison all those who want either independence or Dominion Status.

In conclusion, it must be said that the conviction of Pandit Jawaharlal Nehru, after he had openly told Calcutta students and the public that freedom could not be won by terrorism but only by a mass movement and that that movement must be non-violent,—his conviction under these circumstances makes plainer what was plain before, *viz.*, that the executive are against all freedom movements alike, be they violent or non-violent.

What a "Seditionist" Wants and a "Moderate" Wants

It has been held by the Chief Presidency Magistrate of Calcutta that Pandit Jawaharlal Nehru was guilty of sedition, because, among other things, he sought "to put an end to foreign domination."

The Leader is a "Moderate" organ. It wrote editorially on the 17th February last:

> So far as the vast majority of people in India are concerned they do not want to sever their connection with Britain, but what they do want is that *the existing system of tutelage and domination should end* and that its people should be allowed full freedom to manage their affairs and that its status should be similar to that of the self-governing dominions. (Italics ours.—Ed., *M. R.*)

It cannot be said that Pandit Jawaharlal is a seditionist because he wants to sever India's connection with Britain. For in an article which he contributed to the London *Daily Herald* some time ago and which has been reproduced in the January number of *The Living Age* of New York he observes that the realization of his political ideal "does not rule out the fullest co-operation with the British people or other peoples who do not wish to exploit us."

Pandit Jawaharlal Nehru's Messages

It is stated in the daily papers that

> Just before delivering himself up to the custody of the police Pandit Jawaharlal Nehru sent the following telegram to Mahatma Gandhi:

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

"Going back for rest-cure, Calcutta this time, love and all good wishes."

He sent the following telegram to his daughter, who is at Poona :

'Am going back to my other home for a while. All my love and good wishes, cheerio.'

The following telegram he sent to Babu Rajendra Prasad. Patna :

"Sorry cannot help you any more in relief work, wish you and your colleagues all success in your noble endeavours. May Behar emerge victorious from this ordeal. Love."

Reconstruction in Bihar

Describing the requisites of reconstruction Babu Rajendra Prasad, the Bihar leader, sums up :

> I have indicated some of the problems which have to be tackled in any scheme of reconstruction, taking a long view of things and not content with mere tinkering. They are difficult enough, but we cannot afford to be deterred by them. They require engineering skill and agricultural knowledge. They require appreciation of practical economics, as distinguished from mere book knowledge. They require a thorough knowledge of the strength and weakness in the character and culture of our people. Above all, they require a long vision and a determined will and a band of sacrificing and devoted workers.

The afflicted people of Bihar will have and deserve to have all the help that their fellow-countrymen can give them. But above all,

By the courtesy of *Ananda Bazar Patrika*

Pandit Jawaharlal Nehru with a band of workers engaged in clearing the debris at Monghyr

they require to be inspired with faith and hope and courage and self-reliance. By engaging in clearing the debris with his own hands, in collaboration with bands of other workers, Pandit Jawaharlal Nehru has rendered signal service to the people of Bihar. Though removed from the scene of his labours, let us hope his example will continue to inspire all workers. Even European officers have felt obliged to follow his example.

As regards planning, Babu Rajendra Prasad is quite right in saying :

> We must make sure that the wrecked towns are not going to be a replica of what they were before but that they are going to have wider roads, nearer and more ventilated houses and healthier surroundings, that they are not going to perpetuate the time-old segregation of the so-called lower castes, recreate the slum conditions of the so-called advanced towns of modern days—in other words they are going to be rebuilt so as to ensure the physical, social and moral health of the community.

Regarding the problems of the countryside he observes :

> In the countryside the problems of reclamation of land and rehabilitation of the cultivators have to be investigated and a line of action clearly chalked out. Can the land be rendered fit for cultivation by ordinary ploughing, deep ploughing or physical removal and disposal of the sand? Can the sand yield to some chemico-mechanical treatment? Can the Himalayan streams be trained and harnessed to irrigate the sandy tract or yield the motor energy to revitalize the humming life of the plains between the Himalayas and the Ganges? What crops can be grown with or without the help of such energy? If rice is impossible, can we have other crops which can be grown on sandy land? There are certain crops which serve to bind the sand with the earth and make what is sandy loam fertile. Can they be used here? If so, what are they and how and wherefrom can seeds be got? Will fruit culture prosper? Melons and Kharbuzas are ordinarily grown in sandy land and Diaras. Where can they be sold, if grown in large quantities? What about ground-nuts? Earth has altered, but not the sun or the seasons. We may expect rains and also floods. What are the crops that prosper in these conditions? Areas large tracts are under water. Can they be utilized for fish culture? Can they be utilized for cultivation of plants like 'Singhara?' Can we hope to grow paddy in them? If the land has become uncultivable, can it be made to grow timber and converted into forest? If so, what trees are likely to prosper there?

He deals with equal farsightedness and breadth of outlook with the problems of cottage industries, emigration and finance.

Mr. K. P. Jayaswal's Presidential Address

It was recorded in the last issue of the *Review* that the Baroda session of the Oriental Conference was very successful. Mr. K. P. Jayaswal, one of the leading historians of India, delivered an able presidential addres-

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Mr. K. P. Jayaswal

in the course of which he drew up a constructive programme of Indian history by Indians. Said he :

> The most notable and satisfactory feature of the present time in our field is the high level of achievement attained by Indian scholarship in its manysided and varied activities. Here I should like to quote from a competent surveyor, Prof. Sylvain Levi, a member of the French Academy, the Second President of the Oriental Conference, the foremost Indologist of France. In a letter dated the 7th of November, 1933, he writes to me :
>
> "Do not fail to tell the scholars assembled for the Seventh Oriental Conference that I shall be ever grateful to them for the honour that was conferred by them upon me at the 1921 meeting. Indian scholarship in India has made wonderful progress in the meanwhile, and the many periodicals now published by Indian savants in India can, almost all of them, compete with the best scientific journals published in the West."
>
> This is the best brief review which can be rendered in the Sutra style ; and coming as it does from an Elder of our Sangha, I am relieved from the task of essaying to render it myself....
>
> Our work has suddenly taken a new turn. Altogether a new orientation has come into play. Indian matters recently come to light, are refusing to own geographical boundaries of the present or ancient India. The Indus script is claiming a world-wide range. It seems that we are on the verge of the conclusion that the script on the seals found at Harappa and Mohan-jo Daro is closely allied to signs recorded from Elam, Cyprus, Crete and probably further. We see on the horizon a light which seems to have lighted the lands from the Indus up to the Atlantic.
>
> This much is certain that we have been brought face to face with a very widespread and long-standing civilization extending, at least, from India to the Mediterranean, traces of which have already been recovered from sites in North and North-Western India, Baluchistan, Sistan, Iran, Mesopotamia and westwards. In India itself the terracottas found at Buxar and at Pataliputra seem to extend the area of that culture much eastwards. It seems premature to limit the "Indus Civilization" to the valley of Indus alone.

Not only in time but in space also Indian historians must extend their vision.

> The field of Indian research for the known historical times too is extended beyond the limits of the present-day India by our having realized the fact that Indian history embraces within its fold the Hindu colonies in Indo-China, Cambodia, Siam, Sumatra, Java, Bali, Borneo, etc., to the East, and Central Asia to the North. The movement started by my friend and pupil Dr. Kalidas Nag in this country through his Greater India Society, is primarily responsible for impressing upon Indian scholars the importance of Insulindia and Further India. It has been my good fortune to receive inspiration from my own ex-pupil in leading me to identify references to the eastern portion of Greater India in our own literature, the Puranas, the Manjusri Mulakalpa, and the inscription of Samudra Gupta on the Allahabad pillar, which I have placed before the scholarly world through some recent publications.

Again :

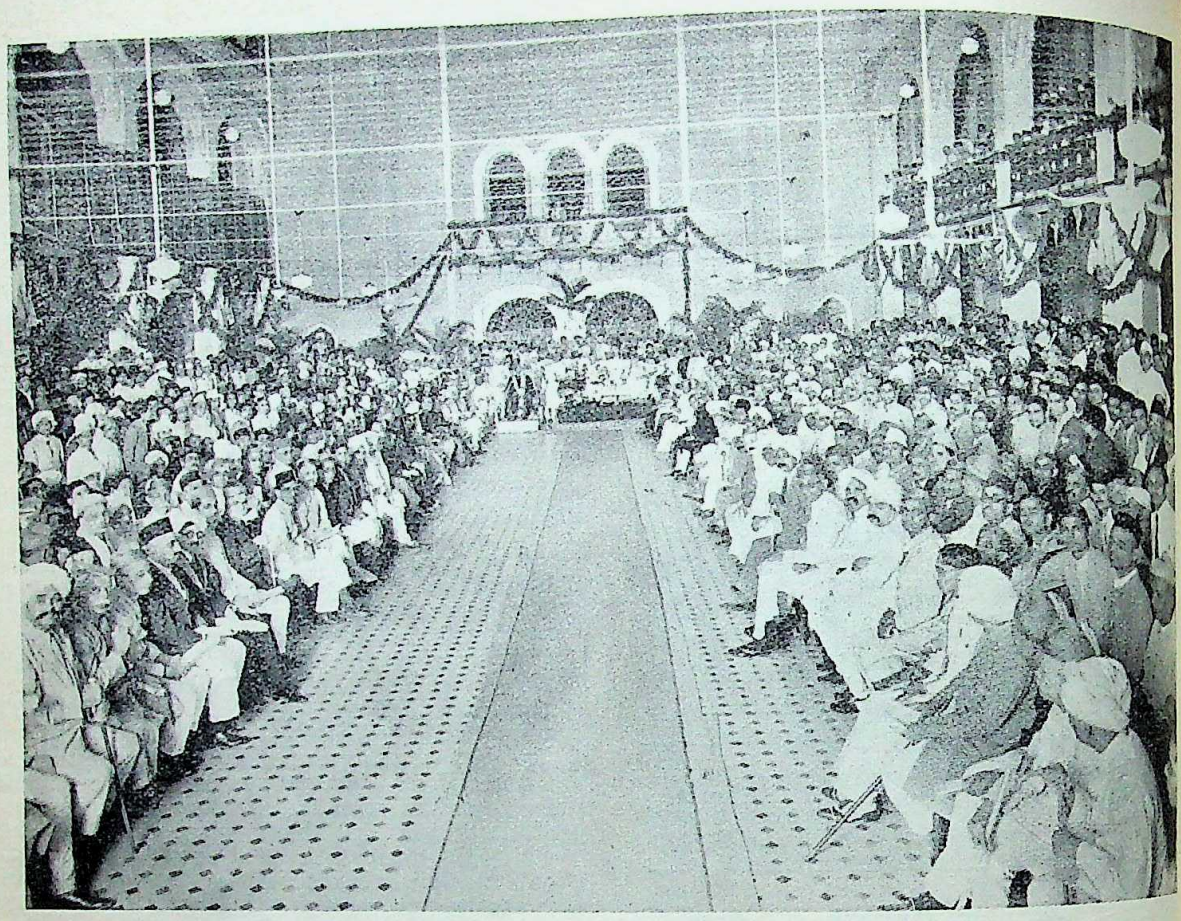
> Our knowledge of the expanse of Indian culture in Central Asia is being widened by the various European and American scientific expeditions, *e.g.*, the American Central Asian Expedition in Mongolia and North-West China, the Sven Hedin (Joint) Expedition in Central Asia, the work of Von le Coq and Grunwedel in the Turfan Depression and the neighbouring districts, and last but not least, the explorations which have been done and are being done by our own indefatigable scholar Sir Aurel Stein. Even a sidelight has been thrown on our own history from such an unexpected quarter as the Paikuli Sassanian Inscription of 293 A.D., thanks to the researches of Dr. Herzfeld.

India Institute of Die Deutsche Akademie Scholarships

On behalf of India Institute of Die Deutsche Akademie we wish to announce that the following scholarships in institutions of higher learning in Germany will be available for Indian scholars (male or female) of out-

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri



Oriental Conference at Baroda

standing ability, for the academic year of 1934-35 :

1. Dresden : One scholarship at the *Technical University of Dresden*, consisting of free tuition and a pocket-money of RM 30 (thirty marks) per month.

2. Hamburg : One scholarship at the *Universtiy of Hamburg*, consisting of free tuition and a pocket-money of RM 30 (thirty marks) per month. The candidate will be given free private coaching in the German language.

3. Hohenheim (Wurttemberg) : One scholarship at the *Agricultural University of Hohenheim* consisting of free tuition and free lodging.

4. & 5. Jena : Two scholarships at the *University of Jena*, consisting of free tuition and a pocket-money of RM 30 (thirty marks) per month for each scholarship.

6. Munchen : One scholarship at the *University of Munchen*, consisting of free tuition and lodging.

7. Stuttgart : One scholarship at the *Technical University of Stuttgart*, consisting of free tuition and lodging.

8. Tubingen : One scholarship at the *University of Tubingen*, consisting of free tuition and lodging.

9. One scholarship of RM 500 (five hundred marks), the choice of the University being left to the candidate. This scholarship was placed at the disposal of India Institute of the Deutsche Akademie by the Allianz and Stuttgarter Lebens-sicherungsbank A. G., Berlin.

These scholarships are tenable provisionally for two academic semesters only. The first semester begins early in November 1934 and the second semester ends in July 1935.

Applicants for these stipends must be graduates of recognized Indian Universities, preference scholars possessing research experience. Applications from non-graduates will be given consideration, only if they have recognized literary or scientific achievements to their credit. The applicant must possess good health and supply at least two recommendations from professors or Indian public men, about his scholarship and character. *It is desired that the applicant should have fair knowledge of the German language, as academic work in Germany is carried on through the medium of German.*

No application will be given consideration, unless it is guaranteed for by some prominent professor or an otherwise well-known Indian public man, that the applicant is really earnest about his application and will certainly come to Germany before the 1st of September 1934, if a scholarship is offered to him.

It is imperative that a stipend-holder should arrive at Munich by the 1st of September and stay in the city *at his own cost* till the academic year begins in November, *devoting these weeks to intensive study of German language* in the German language courses for foreigners at the University of Mu-

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

where he will be exempted from tuition-fees. It is however presupposed that an applicant for a scholarship possesses working knowledge of German. We are forced to take this measure, because a student not having adequate knowledge of German before beginning his academic work fails to get the benefit of his attending the University and often loses six months' time.

We want to make it clear that apart from the scholarship the stipend-holder must be prepared to spend at least RM 100 per month for the necessary expenses not included in the different scholarships.

All applications should reach India Institute of Die Deutsche Akademie before the 10th of April 1934. A special committee of experts will select the successful candidates, who will be promptly notified of the decision. Selection of successful candidates will be determined solely by the academic qualifications of applicants. Certificates and testimonials of applicants *will not be returned.*

All applications should be *directly* sent to the following address :

Dr. Franz Thierfelder
Hon. Secretary
India Institute of Die Deutsche Akademie
"Maximilianeum"
Munich, Germany.

North German Lloyd Company offers a reduction of 10 per cent on the fare for single trip in cabin class or second class for the Indian students of the Deutsche Akademie coming to Germany or returning to India from Germany, provided they travel during the "off-season," *i. e.*, from Europe during April to July and from Colombo from July to January. Detailed information on this subject can be secured from the representative of North German Lloyd at Colombo, c-o the office of Hanseatic Trading Company, Colombo, Ceylon.

Rabindranath Tagore and Rural Reconstruction

[Mr. Robindra Mohon Datta, M.Sc., of Panihati has sent us the note printed below.]

Mr. C. F. Strickland, C.I.E., in his "Review of Rural Welfare Activities in India 1932" says with regard to the activities of Sriniketan of the Poet Tagore :

"The dangers appear to be that, despite much inspiring effort, (*i*) the spirit of the institution, possibly even the institution itself, may not long outlive Dr. Tagore, and (*ii*) the work done, with lofty intention and unselfish labour, may be unscientific and superficial. These terms must certainly be applied to the rural 'Survey' of Ballabhpur hamlet, a report of which has been published."

In fact, the above sweeping remarks of Mr. Strickland does not hold good in any case. Whether the activities are carried on on scientific or unscientific lines will be quite clear from the following extract from the Bengal Public Health Report for the year 1929 by Dr. C. A. Bentley, Director of Public Health, Bengal (Bengal Secretariat Book Depot, 1930) :

"127. Visva Bharati.—A few lines in connection with the health activities of Visva Bharati will not be out of place here.

(1) Village Survey :—Rural survey of Raipur village was completed during the year ; the survey of Goalpara, Bandhgora and Bhubandanga are progressing.

(2) Village Reconstruction :—(*a*) Ballavpur.—About a hundred years ago this village was very prosperous and had a population of 500 families which have now dwindled to only 23 families. A thorough survey of the village was completed in 1924-25. A co-operative health and rural reconstruction society was formed in 1925 and was registered on the 10th November of the same year. Since then 2,829 feet of new road have been constructed, 6,716 feet of drains opened and 11½ bighas of jungles cleared. Every year the roads are repaired and the drains cleaned. 6,682 grains of quinine were distributed in 1929 against 9,428 in 1928 and 31 dobas were kerosinized with 32 lbs. of Kerosene. In the year under review the percentage of cases from malaria among those who took quinine was 33 against 17·3 in 1928, 18·0 in 1927, 52 in 1926 and 85 in 1925. The incidence among those who did not take quinine was 52.6 in 1929. This unsatisfactory increase in the malaria rate is accounted for as follows : (*i*) The gradual decrease in the number of cases of malaria during the previous years created a mistaken impression among the people that there was no more danger from malaria, resulting in a discontinuance of the practice of taking quinine regularly in the year under report ; (*ii*) all the dobas and tanks could not be Kerosinized as some of these were still surrounded by thick jungles ; (*iii*) most of the people were too poor to use mosquito curtains. Forty-eight persons were vaccinated against small-pox. Of the 4 *dais* trained in 1927, one successfully attended calls from 8 villages within a radius of 5 miles.

(*b*) The following table shows the Health Work done in villages Benuri, Lohagarh, Bahadurpur, Bhubandanga and Bandhgora :"

[The tables show the total population, numbers of health societies, extent of jungles cleared, roads repaired and cleared and new roads opened, drains cleared and new drains opened, dobas filled up, dobas cleaned and cleared, dobas kerosened, amount of kerosene used, quinine distributed, and malaria cases among members and non-members.]

The above extracts speak for themselves. Will Mr. Strickland now retract his unjustified remarks against the Poet ?

Agricultural Institute for Rajshahi?

It was in December last that *Current Science* wrote that "a scheme for starting an Institute for imparting training in Agriculture has been

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

formulated, following a conference between representatives of the Government and the executors of the endowment made by the late Kumar Basanta Kumar Ray of Dighapatia. The training will include both practical and theoretical aspects of agriculture, and will be a two-year course. The recurring costs will be met from the interest, which amounts to about Rs. 16,000 per year." The Kumar made the endowment a good many years ago. But his wishes have not yet been given effect to by the Government, nor is it known definitely when they will be.

Agricultural Education in Bengal

Bengal is the most populous province in India, and its population is not less agricultural than that of the other provinces. But there is no agricultural college in Bengal, such as there are in some other provinces. In the latest (the tenth) issue of *Statistical Abstract for British India*, published in 1933, it is stated that the total expenditure from all sources on agricultural colleges was: in Madras Rs. 1,04,023; in Bombay Rs. 1,73,308; in the United Provinces Rs. 1,75,418; in the Panjab Rs. 1,41,740; in Burma Rs. 2,31,735; in the Central Provinces and Berar Rs. 75,212; but in Bengal *nil*. Against Bihar and Orissa there is shown no provincial expenditure, as the expenses of the agricultural institute of a high grade at Pusa, amounting to many lakhs, are met from Imperial revenues.

Irrigation in Bengal

It is not merely in the matter of agricultural education that the Government has not done for a predominantly agricultural province like Bengal what ought to have been done, but in irrigation also there has been similar neglect. There is no province of India of which all parts can do without irrigation from irrigation works. Bengal is no exception. Many of its districts, particularly in West Bengal, stand in need of irrigation. When Mr. G. S. Dutt was magistrate of Bankura, for example, it was estimated that there were in that district under its Hindu Kings some 30,000 to 40,000 irrigation tanks, besides an irrigation canal, several miles long, known as "Subhankarer Danra." Most of these have silted up in course of time, without practically any substitute for them. The like has happened in many other districts.

The following table, compiled from the *Statistical Abstract for British India*, Tenth Issue, 1933, shows the mileage of productive irrigation works in different provinces of India in operation and the total capital outlay on them:

Province	Mileage	Capital Outlay
Madras	3,749	12,65,53,942
Bombay	4,986	19,44,75,706
Bengal	*Nil*	67,43,541
United Provinces	2,372	22,00,25,636
Panjab	3,266	32,78,02,051
Burma	354	2,12,21,281
N.-W. F. Pr.	86	74,07,400

It is noteworthy that, though Bengal, according to the latest *Statistical Abstract*, had not a single mile of productive irrigation works in operation, yet the expenditure of Rs. 67,43,541 is shown against her.

As regards "unproductive works"—the expression is taken from the *Statistical Abstract*, the following table also will show that Bengal has been discriminated against:

Province	Mileage	Capital Outlay
Madras	716	4,03,94,528
Bombay	2,832	12,82,87,004
Bengal	70	84,92,053
United Provinces	447	3,11,86,812
Panjab	1,047	59,67,195
Burma	140	1,70,30,509
Bihar & Orissa	718	6,27,63,915
Central Provinces	352	6,63,17,673
N.-W. F. Pr.	138	2,20,14,647

If "unproductive" means unproductive, then more than thirty-eight crores of rupees have been wasted on these works.

Bengal Water-ways

The Bengal Legislative Council has passed a Water-ways Bill. Its object is to improve the existing water-ways of Bengal for the purpose of navigation, and possibly also to construct new ones for the same purpose. Serviceable water-ways for navigation may be used for irrigation also to some extent, but not as much as works constructed primarily for irrigation. Yet, as we have seen, little has been done for irrigation in Bengal by the Government. What may be done for navigation will benefit mainly East Bengal, which Sir Abdel Kerim Ghuznavi hails

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

which does not stand in need of irrigation so much as West Bengal.

But supposing water-ways used for navigation will facilitate irrigation as much as irrigation works proper, let us see what Government will spend for such water-ways. The magnificent sum of Rs. 2,50,000 per annum is to be spent for the purpose! It has been shown in the previous note that in the Panjab the sum of Rs. 32,78,02,051 has been spent on productive irrigation works in operation. To reach the Panjab standard of expenditure the Bengal Government will take just the brief period of thirteen centuries, or, to be precise, thirteen hundred and eleven years and a few months and days!

Government Educational Expenditure in Bengal

It is not merely in agricultural education and irrigation that Bengal has been neglected. This has been the case in other matters also calculated to directly benefit the people. Take education. Expenditure on education from Government funds in different provinces is shown in the table printed below, compiled from the latest *Statistical Abstract* and *Census Report*.

Province	Population in 1931	Educational expenditure from Government Funds
Bengal	5,01,14,002	1,54,03,615
Bihar & Orissa	3,76,77,576	64,25,995
Bombay	2,19,30,601	2,04,27,146
Burma	1,46,67,146	84,95,340
C. P. & Berar	1,55,07,723	55,10,868
Madras	4,67,40,107	3,11,83,313
Panjab	2,35,80,852	1,85,13,340
U. P.	4,84,08,763	2,21,88,938

In considering the figures given above, it should be borne in mind that the Government of India derives more of its revenue from Bengal than from any two other provinces of India combined.

Official Up-to-date-ness

The Tenth Issue of the *Statistical Abstract of British India* was printed in July, 1933, and the latest Census of India was taken in February, 1931. So between the printing of the *Statistical Abstract* and the taking of the census, there was roughly an interval of two years and a half. And in the meantime an abstract of census statistics had been officially published. The two India volumes—Report and Tables—of the census of 1931 had also been printed in July, 1933. Yet, we find that the Tenth Issue of the *Statistical Abstract* gives the census figures according to the census of 1921!

The late Mr. A. Rangaswamy Aiyengar

By the death of Mr. A. Rangaswamy Aiyengar, late editor of *The Hindu*, Indian

Mr. A. Rangaswamy Aiyenger

journalism has lost one of its most distinguished devotees. In addition to the other qualifications which a journalist should possess, he possessed an expert's knowledge of constitutional law and finance. He served his apprenticeship in journalism under his uncle Mr. Kasturiranga Aiyengar and wrote a book on the governance of India. Subsequently he became editor of the Tamil daily *Swadesamitran*. He succeeded his uncle in the editorship of *The Hindu*. This daily has had a succession of eminent editors. That under him it did not suffer any loss of

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

reputation testifies to his remarkable abilities. He was an adherent of the Congress and belonged to the Swarajya party, and acted for some time as secretary to both. He was for some time a member of the Legislative Assembly and made many able speeches there. He went to London as a "delegate" to the second so-called Round Table Conference and gave proof there of his knowledge of matters constitutional and of his controversial powers.

The late Mr. Madhusudan Das

Mr. Madhusudan Das, who died last month at the advanced age of 86, was Orissa's first graduate. He was a distinguished lawyer and a still more distinguished practical patriot of Orissa. He devoted himself heart and soul to the resuscitation of the arts and crafts and cottage industries of Orissa. He lost large sums of money in the Utkal Tannery and other patriotic ventures. He was a Christian but was never de-nationalized. When the Prince of Wales came to India, Mr. Das was a minister of the Bihar and Orissa Government. So he had to attend the *durbar* of the Prince of Wales. But he refused to do so in European costume. It was decided in consequence that Indian ministers could attend the *durbar* in Indian dress. When Orissa was a part of the Province of Bengal Mr. Das was a member of its Legislative Council four times. In 1913 he was elected a member of the Imperial Council by the Bihar and Orissa Council. Under the Montagu-Chelmsford scheme, he was a minister of the Bihar and Orissa Council.

When it was proposed to reduce the salary of the B. and O. ministers, Mr. Das offered to serve without any salary, provided he was allowed to practise in the law-courts as a lawyer, for he was comparatively a poor man. Some of his reasons for being allowed to practise were that Bihar and Orissa was a comparatively poor Province, and hence all that could be done to reduce public expenditure should be done; that in the Local Self-Government Department many persons work as chairmen, members, etc., of municipalities and district and local boards without salary, and therefore, "in an organization in which all the workers are honorary a salaried Minister mars the symmetry and harmony of the organization"; and that when persons like the Maharajadhiraj of Darbhanga and the Raja of Mahmudabad could be members of the Executive Council and it was not considered impracticable or incongruous for them at the same time to manage their vast estates and become parties to and witnesses in law-suits, it could not then be held objectionable for a minister to be a practising lawyer. But the Bihar Government did not accept his proposal. So he resigned.

At one time he had great influence over the Chiefs of Orissa, and they followed his advice and he kept watch over their interests. During the last years of his life he suffered from ill-health and financial worries, but never lost hope and enthusiasm for Orissa. He was one of the presidents of the Indian Christian Association.

The late Sir Provas Chunder Mitter

Sir Provas Chunder Mitter was apparently in the best of health when he suddenly died of failure of the heart last month. He began life as a practising lawyer and ended his career as a Government officer, dying in harness. He was a very experienced and able officer, possessing complete mastery of the details of Bengal's educational and financial problems. No one had a more thorough grasp of the land revenue problem of Bengal. He had served the Bengal Government both as a minister and a member of the Executive Council. In politics, he belonged to the old Congress school, now known as the Indian Liberal party. He had served both the Indian and the British Indian Association in honorary official capacities. The fact that he was a member of the Rowlatt Committee and signed its report made him unpopular. As a "delegate" to the so-called Round Table Conference, he went to London twice, and was the first to claim for Bengal the proceeds of the Jute Export Duty. If Bengal gets even a portion of that duty, no small part of the credit will be his. He is also entitled to praise for the diminished capitation charge to be henceforth taken from India. It

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

said that the outline of the Montagu-Chelmsford Reform scheme was his handiwork.

He was long connected with the Society for the Improvement of the Backward Classes in Bengal and Assam, for some time as its president and some time as its patron, and used to contribute to its funds. This Society has some 450 schools under its control, with some 18,000 boys and girls as pupils.

The late Swami Sivananda

Swami Sivananda, President of the Ramkrishna Mission and Belur Math, passed away last month at the ripe old age of 80. He was a direct disciple of Paramhamsa Ramkrishna. From youth upwards he was of a religious turn of mind. Coming in contact with and under the influence of the Paramhamsa he renounced the world, gave up his job and became a sannyasin, rising gradually to be the head of the Mission. He spent some time in Ceylon as a preacher, and established several Ashrams in different parts of India. His life was uneventful, as that of sannyasins generally is.

Anglo-Soviet Trade Pact

Anglo-Soviet trade relations have been re-established by the Anglo-Soviet Trade Pact. It "provides for the reciprocal most-favoured-nation treatment of Soviet goods in the British Empire excluding the Dominions." This is an indirect recognition of the fact that the Dominions are no longer under British rule and imperialism. Apparently for wishing for such a condition for India Pandit Jawaharlal Nehru has been sent to jail for two years.

The Pact proves that the communist Bolsheviks and the capitalist Britishers do not consider one another untouchable.

There has been a similar commercial rapprochement between capitalist America and communist Russia.

One touch of gold (or is it silver or paper ?) makes the whole world kin.

Government Servants and Politics

NEW DELHI, Feb. 16

An important change defining what is meant by Government servants taking parts in politics and elections has been gazetted today amending the Government Servants' Conduct Rules and substituting the following for sub-rule (1) of Rule 23.

(1) Subject to provisions of Rule 22 and of any general or special order of the local Government no Government servant shall take part in, subscribe in aid of or assist in any way any political movement in India or relating to Indian affairs.

Explanation of the expression political movement includes any movement or activities tending directly or indirectly to excite disaffection against or to embarrass Government as by law established or to promote feelings of hatred or enmity between different classes of His Majesty's subjects or to disturb the public peace.

(2) No Government servant shall permit any person dependent on him for maintenance or under his care or control to take part in or in any way assist any movement or activity which is or tends directly or indirectly to be subversive of Government as by law established in India.

EXPLANATION

A Government servant shall be deemed to have permitted a person to take part in or assist a movement or activity within the meaning of clause (2) if he has not taken every precaution and done everything in his power to prevent such person from so acting or if when he knows or has reason to suspect that such person is so acting he does not at once inform the local Government or officer to whom he is subordinate.—A. P.

The old rule directed Government servants not to take part in or subscribe in aid of any political movement, etc. The changed rule prohibits assisting in any way any political movement. So the prohibition now becomes more comprehensive, vaguer and more elastic. That is the beauty of all such rules.

According to the old rule, if a Government servant had any doubt as to whether any action which he proposed to take would contravene this rule, he was to refer the matter to the local Government or the authority to which he was immediately subordinate, and thereafter act according to the orders received. Thus the old rule made things safe for those Government servants who could not themselves decide what to do. Would it be permissible for them now to seek the guidance of higher authorities ?

The explanation of "'political movement" is comprehensive in its vagueness. It is difficult to say what may or may not embarrass Government. What *is* embarrassment ? Can or does anything really embarrass the august entity known as Government ? Henceforth many beneficial, or at any rate harmless, social, caste or communal movements and activities may come under this explanation.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Those who depend on or are under the care or control of Government servants are henceforth to consider themselves to be unpaid Government servants. Government servants may henceforth be made responsible for whatever their sons or other relatives, forming a joint family, may do, unless the joint family be legally broken up, or the sons, etc., are disinherited and driven away from home; for these are included in "every precaution" and "everything in his power."

The father or other guardian, when he is a Government servant, is practically to be required to do a bit of informer's work, without extra payment, in relation to his wards.

The altered conditions of Government service may not bring Government into increased hatred or contempt. But they will not enhance the affection or respect which the near relatives and friends of Government servants should feel for them.

Calcutta Celluloid Works Ltd.

The Calcutta Celluloid Works was at first established as a private concern by Mr. J. N. Bose, who has learned the art of making celluloid and celluloid articles in Japan. Having succeeded in producing articles of high quality and finish, which we have ourselves seen and liked after use, he has recently converted the factory into a limited liability company, with a strong board of directors. We are glad to find our own impressions confirmed by the opinions pronounced by distinguished industrialists and men of business. Recently Acharya Praphulla Chandra Ray, accompanied by Sj. Rajsekhar Bose, late manager of the Bengal Chemical and Pharmaceutical Works, Mr. J. C. Das, managing director of the Bengal Central Bank Ltd., and others paid a visit to the factory.

> Mr. J. N. Bose, Managing Director of the Company, took him over the whole factory and explained to him each stage of the work that is being done there. Acharya Ray was perfectly satisfied with all that he saw. The finished articles of daily use appeared to him to be of very good quality. It was a matter of great gratification to him that this purely Indian concern was such a success within a short period of time. He cordially congratulated the Company on its success and wished it a long, glorious and useful career.

Madras School of Arts Exhibition

The Madras School of Arts Exhibition continues to be popular. *The Hindu* reviews it as follows, in part:

> The third annual exhibition of the Government School of Arts is a most interesting show and a striking evidence of the progress which the school is making from year to year. The average is distinctly higher and the technique as varied as it is interesting.
>
> Mr. D. P. Roy Chowdhury, the Principal, exhibits extremes of handling in his "Namaz" and "Mountain Maid," the one precise and delicate, the other bold and virile, differences which are well in harmony with the themes of their subjects. Mr. Chowdhury's two portrait busts of his wife and of Sir Archibald Campbell are works of great merit. Mr. V. R. Chitra is perhaps the only one to work in the traditional style and as such his works possess a distinct value of their own. His little portraits of Kashmiri maidens are delightful charming, His "Returning from the Pond" and "Musicians" are remarkable specimens of temperate work. Mr. Syed Hamed's "Through the Leaves" is a high key subject well carried out...A powerful picture is Mr. Lokayyas "Meditation of Siva." "Pohait" and "Priest" by Mr. V. D. Govindan are two works which leave little to be desired in them. The "Old Couple" by Mr. Dastidar is perhaps, the most outstanding work in the show. Mr. B. M. Sein's "Twin" breathes the same sentiment though entirely different in its composition. Quite the best sculptural work seen for some years past in Madras is "Rasa-lila," a somewhat large panel in relief which depicts a well composed group of dancers and possesses a wonderful sense of movement.
>
> CRAFT SECTION
>
> It is in the craft section that progress is most evident and the specimens of work exhibited here cover a wide range of activity. For the first time in an exhibition one can see displayed suites of furniture suitable for Indian homes. The designs are by Mr. V. R. Chitra, who has evidently given a good deal of thought and care in the work. The lacquered furniture of the school is now well known by this time and in the present show some choice specimens are exhibited. Charming examples of jewellery enamels are in a case by themselves. Their design and colouring are both tasteful and novel. This craft which, though quite new to the school, has been well mastered and the specimens of work compare very well with those of more reputed firms.

The Aga Khan to be Prime Minister?

A rumour has been set afloat that the Aga Khan will be made the first prime minister of Federated India.

Broadly speaking there are two classes of politically-minded Indians. One class will work the White Paper scheme, the other will not. Nothing need be said regarding the numerical strength or the comparative sincerity and devotion to the cause of the country

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the sacrifices made for it by these two parties. The prime minister will be chosen from the former class. If the choice is to fall on the ablest man, irrespective of communal considerations, there are men far abler, more public-spirited, more devoted to the cause of India and more in touch with the country than the Aga Khan. If the choice must fall on a Muhammadan, even then there are abler, more public-spirited and fitter persons than the Aga Khan.

The Railway Budget Deficit

The Railway Budget continues to show a deficit, though it is less than in the immediately preceding years. It is said the railways have seen the worst, and better days are in store for them. May it be so.

Of the causes of railway deficits some are temporary, economic depression, for example. With the gradual disappearance of this factor, there would be a corresponding decrease in the deficit.

As many a little makes a mickle, some Government measures, for example those in Bengal to cope with the non-violent Congress movement or similar ones meant for combating terrorism, must have contributed, to however small an extent, to produce deficits. To frustrate the efforts of Congressmen to hold the last session of the Congress in Calcutta, tickets were not issued from many stations to Calcutta for some days as freely as usual. Similar steps were taken in some districts to prevent the holding of political conferences by Congressmen. Recently by order of the District Magistrate of Chittagong the running of some of the usual trains to and from Chittagong was discontinued for a certain period. In the Midnapur district also freedom of movement has been considerably hampered. Young Indian strangers are looked upon all over India—particularly Bengalis and in Bengal, with suspicion owing to political causes. For this reason adventurous young men even of a non-political bent of mind are not unoften disinclined to travel.

Strategic railway lines have never been paying. As these were constructed and are meant to keep Britain's hold over India—at least mainly, the cost of their construction and upkeep ought to be paid by the British people, at least in great part.

The costliness of railway administration in India is due to a great extent to the fact of its being top-heavy. Pandit Chandrika Prasad has shown again and again that in no country of the world is there such a vast difference between the salaries paid to the highest grades and those paid to the lowest class of railway servants. The highest and higher salaries can be considerably reduced without any loss of efficiency, and so they ought to be reduced. The lowest grade employees ought to get at least a living wage.

The railways should and can be completely Indianized in the course of a definitely fixed short period, Anglo-Indians and domiciled Europeans being considered as and treated on a footing of equality with Indians. This would make it easier to effect economies.

Third-class passengers are the mainstay of income from passenger traffic. Yet the railway administration cares the least for the health, convenience and comfort of third-class passengers. We are not quite sure whether in all railways all third class compartments even in through trains are provided with lavatories. Third-class lavatories, where they exist, ought to have a sufficient supply of water, and also light at night and daylight during day time. There should be fans, for use in summer, in all third class carriages. It is true, third-class passengers have no fans in their houses. But there they are not compelled to keep inside their rooms always; they can often live in the open. And it should be borne in mind that, except in big towns, even second class passengers do not all have fans in their houses, and yet the railways give them fans.

In through trains for long night journeys there ought to be some sleeping accommodation even for third-class passengers.

Several times every year higher class passengers are offered considerable concessions for return journeys, and ordinary return tickets also can be had by these passengers at concession rates. Third-class passengers have no such advavtages. They should be given these advantages. Even for ordinary single journeys the fares taken from third-class passengers can and should be reduced.

The Eastern Bengal Railway is a State railway just like the East Indian Railway. Yet the fares in the former are higher than

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by eGangotri Sarayu Trust Foundation Chennai and eGangotri

in the latter. It has been said that the length of the lines in the former are less than the length in the latter, and therefore higher fares have to be charged. But that is no justification. In all provinces, there are some districts of which the civil administration, postal work, etc., are carried on at a loss. But for that reason the Government do not charge higher registration fees and court fees and postal rates in those unremunerative districts than in other ones. Moreover, the high rates of fares in the E. B. Railway stand in the way of growth of passenger traffic and of profits.

Passengers in central, east and north Bengal have another disadvantage. Travelling in these parts is comparatively slow. For example, the distance from Calcutta to Allahabad is much greater than the distance from Calcutta to Chittagong. Yet one can travel from Calcutta to Allahabad in 13 or 14 hours, but the journey from Calcutta to Chittagong takes some 24 hours. True, part of the latter journey has to be performed by steamer. But there is no reason why river navigation should be so slow as it is. The steamer fares charged do not err on the side of cheapness.

The treatment of the third-class passengers by railway servants admits of still further improvement, though it must be admitted that there has been some improvement.

Regarding goods traffic, it is sure to improve and prove remunerative if the railways adopt a policy and rates which would promote Indian industries. There should not be even the shadow of a suspicion left that the railways are meant mainly to push the export of raw materials abroad for their import to India in the form of manufactured articles and to promote imports of other foreign manufactured goods also. Indian railways should do all that is possible in the way of reduction of freight, etc., to promote Indian industries and agriculture.

Statutory Railway Authority

The railways in India have cost the Indian taxpayer some 850 crores of rupees, when loans were taken for them they were guaranteed on the security of the general revenues of India, and at least 75 crores of rupees have been paid on interest charges alone. The railways are in fact the property of the people of India. What the intention of the present Government of Great Britain is in seeking to set up a statutory railway authority by legislation in the British Parliament, does not matter. Whatever the intention, if the statutory railway authority be set up by parliamentary legislation—not by legislation by the highest Indian legislature, and if, as has been proposed in the White Paper, the Secretary of State has the power of recruitment of the railway services, the people of India would be practically expropriated and the Indian railways would be managed in the interests of British merchants, manufacturers and shippers and in those of job-seeking Britishers.

Mr. Gaya Prasad Singh had tabled a cut motion in the Legislative Assembly which resulted in a debate on the subject of the Statutory Railway Authority.

> "It was Mr. Neogy's ruthless analysis of the London scheme that brought the Assembly to realize the dangerous implications of the language of the London Committee's report, and how necessary it was to emphasize the opinion which Mr. Ramaswami Mudaliar, himself a member of the London Committee, declared yesterday, namely, that legislation setting up the Railway Authority should be undertaken in India and not by the British Parliament."

Mr. K. C. Neogy, leader of the Democratic party, pointed out forcibly that

> the meaning of the motion was that the fullest freedom be preserved for this Assembly to legislate in whatsoever manner it liked for setting up a managing agency for the administration of railways in India costing Rs. 850 crores to the Indian taxpayers and that the same right should remain unfettered for this Assembly's successor in regard to amendment of such statute. He and his party would vote only in that sense and not in the narrow sense mentioned by Mr. Ramaswami Mudaliar that legislation should be undertaken in India and not by Parliament. Whatever authority was set up for the administration of railways whether it was called Statutory Railway Board or any other name, it must be subordinate to the Central Legislature and would act as mere agents for the purpose.

Recalling his own speeches in the Assembly on the subject, which he described as a voice in the wilderness, Mr. Neogy pointed out how this point about the Statutory Authority was practically kept away from the influence of the legislature and was smuggled in by the Government of India in their despatch on the Simon Commission Report and specifically mentioned in the report of the Federal Structure Committee of the first so-called Round Table Conference.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

When objection was taken by member after member against this way of doing things the Maharaja of Bikaner was quoted as having approved of it, but the Maharaja of Bikaner disowned it. With such a past as to its origin the matter was again discussed by the Consultative Committee in India when the Indian members again recorded their decision against legislation being undertaken in England on the ground that it would interfere with the authority of the Government of India in railway matters.

Mr. Neogy proceeded to describe our railway systems as the biggest socialist institution of the world, as they were owned by the people, worked for the people and for the benefit of the people. We think they would really be a socialistic institution when they would be entirely Indianized, being controlled and run by Indians alone. Mr. Neogy reminded the Assembly that, in years past,

> when loans were taken, they were guaranteed on the security of the general revenues of the country and how at least Rs. 75,00,00,000 were paid as interest charges alone. That is why the proprietorship of the present or the Federal Government was recognized even in the Government scheme. But what about the agency? The legislature might not exercise full or detailed control, but the fundamental principle that the taxpayers of the country were the principals of the railway property must be fully recognized and not left in any doubt. They could delegate the authority for administering railways to anybody. It could be by legislation or by convention, as was done in the case of separation of the railway finance from the general finance. India would therefore object to legislation by means of adaptation clause, for that really meant Parliamentary control, as the meaning of that phrase was brought out during the discussions on the Reserve Bank Bill.

Mr. Neogy then rebutted the points in Mr. Mudaliar's speech.

He feared that, far from the Secretary of State wiping himself out the moment the Statutory Authority was established, he would really pop his head like Jack in the box; for in the matter of appointments and dismissals the power was largely in the hands of the Governor-General and it would be the Governor-General taking orders from the Secretary of State. It had been clearly specified that the president of the Board would be appointed by the Governor-General and would have the right of access to the Governor-General. Where was the need for this right of access? Then the Governor-General would appoint half the number of members of the Board and in the case of the Chief Commissioner of Railways, his appointment would be subject to confirmation by the Governor-General, which means again taking orders from the Secretary of State.

Services and Finance

Mr. Neogy referred to the voting powers of the Assembly and said that the moment separate authority was appointed without the Assembly being given the right of legislation for, and the control of, its managing agency, then the Public Accounts Committee's scrutiny of the railway accounts, now exercised, would disappear and the auditor-general would not be able to observe the first canon of his duties as regards public expenditure, and this technical check to over-extravagance would be gone.

As regards recruitment of services to railways, Mr. Neogy thought that the Secretary of State would interfere not only when questions connected with communal claims came up, but in the matter of Indianization also the Secretary of State would exercise control by regarding the railway service as a key service, even as Sir Thomas Ryan, when appearing as Secret ry of the Railway Board as a witness before the Islington Commission, treated it. He had this fear, because the White Paper stated that "the question of recruitment by the Secretary of State to superior medical and railway services is under examination and His Majesty's Government hope to submit their recommendation to the Joint Select Committee."

Sir Henry Gidney interposed, pointing out that no decision had been reached and the Secretary of State had promised to submit a note.

> Mr. Neogy quoted from the London Committee's report to show that the Secretary of State would always interfere in the service and the Public Service Commission in India would be consulted only with regard to the framing of rules for recruitment.

Sir Abdur Rahim and Mr. James spoke after Mr. Neogy. They were followed by Mr. N. M. Joshi, Mr. Ranga Iyer, Sir Cowasji Jehangir and Sir Joseph Bhore. The President brought the debate to a close by saying:

> I have been told that the object of the sponsors of the motion and that of the Independent, Democratic, Nationalist and the Centre parties is that they desire to convey their opinion, that "the Constitution Act should merely contain a clause requiring the establishment of Statutory Railway Authority and that its constitution, functions and powers shall be subject to legislation, initial as well as amending, in the Indian Central Legislature."

This was incorporated in the report of the day's proceedings, and Mr. Gaya Prasad Singh was allowed to withdraw his token cut motion.

The Assembly has pronounced its opinion; but the Secretary of State, the Joint Parliamentary Committee, the British Ministry and the British Parliament are not bound to act according to the views of the Assembly. Hence our apprehension is that the people of India would be deprived of their proprietorship of the Indian railways and they would be kept in economic bondage partly by means of these lines of railroad.

Proscribed American Publications

We did not know that "Gandhi *versus* the Empire" by Dr. Haridas T. Muzumdar, an

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

American publication, had been proscribed by the Government of India. But the following paragraphs from *Unity* of Chicago say that it has been :

> "Gandhi *Versus* the Empire" by Dr. Haridas T. Muzumdar, unanimously conceded by the American press to be the best book on Gandhi and modern India, has been banned by the British Government of India, according to advices from India.
>
> "The Government of India have prohibited the importation by post into British India of (a) the book entitled "Gandhi *Versus* the Empire" by Haridas T. Muzumdar, published by the Universal Publishing Company, New York, U. S. A., or (b) any translation, reprint or other document containing substantial reproductions of the matter contained in the said book."
>
> "Gandhi *Versus* the Empire," by Dr. Muzumdar is in good company. The previous American publications proscribed by the British Government are Will Durant's "The Case for India," Dr. J. T. Sunderland's "India in Bondage," and Bishop Fred B. Fisher's "That Strange Little Brown Man—Gandhi."
>
> The British Government's proscription of "Gandhi *Versus* the Empire" is in the opinion of the author, Dr. Muzumdar, very curious and unintelligent, "because four-fifths of the book consists of Gandhi's own writings and speeches, especially his ten historic speeches at the Second Round Table Conference."

Revival of Filipino Freedom Question

In the course of one of his letters contributed to the dailies owned by the "Free Press," Dr. Sudhindra Bose of America refers to the revival of the question of Filipino independence. Says he :

> After a year of bitter fighting over the Hawes-Cutting Filipino independence act in the Philippine Islands, the controversial question is now back in Washington again. The Philippine Legislature, which has rejected the Hawes-Cutting bill, has sent to this country an independence mission headed by Senator Manuel Quezon, dominant political figure in the Islands. Quezon and his fellow-missioners are now in Washington to appeal to President Roosevelt and Congress for a new independence act. Quezon said the Filipinos demand that "we should be granted our independence as soon as we establish the Philippine republic—which cannot take more than two or three years."
>
> A New Program Outlined
>
> Many liberal-minded Americans say, the last thing they want to do is to have to fight to keep the Philippine Islands, which they do not want and which do not want them. The Foreign Policy Association of New York and the Carnegie World Peace Foundation submitted to President Roosevelt last week a six-point programme of independence for the Islands, designed to "furnish a fair and equitable arrangement" satisfactory to both the United States and its insular possession.

Evidently it is not sedition in the United States of America for a dependency to ask and agitate for independence.

Distribution of Salt Import Duty Proceeds

Major D. Graham Pole put a question in the British Parliament in connection with the distribution between the Provinces of the proceeds of the additional import duty on salt. The Under-Secretary of State for India has been in communication with the Government of India on this matter and writes to the Major :

"I am now able to inform you that there is no present intention of discontinuing the distribution of seven-eighths of the proceeds of the additional import duty on salt between the Provinces that consume imported salt. Under this arrangement Bengal received Rs. 5.37 lakhs in 1931-32 and Rs. 5.50 lakhs (Revised Estimate) in 1932-33 ; but the amount distributable depends on the proceeds of the tax, and as the rate of duty was reduced last March, it is not unlikely that the share of Bengal in 1933-34 will be less than in the previous years."

The Legislative Assembly Salt Industry Committee observe in their report that

> When the additional import duty was first imposed, it was decided that seven-eighths of the proceeds should be allotted to the Local Government in which imported salt was consumed in proportion to their share in the trade. Reports obtained from the Central Board of Revenue show that very little money has been devoted by the local Governments out of these proceeds to expenditure in connection with the development of the salt industry in their areas and that practically the whole has been absorbed by the Local Governments concerned for use in meeting expenditure incurred on general purposes. The Committee are informed that out of the one-eighth share that was reserved by the Central Government there will be available by the end of the next financial year a sum of Rs. 24 lakhs after allowing for the actual expenditure and commitments of the Central Government in respect of developments at Khewra and other purposes and the Committee recommend that the Government of India should inform the local Governments that they are prepared, if schemes are submitted, to allot money for local salt development work from this balance.

Chittagong Doings and Interests

From the collective fines imposed on the Hindus of Chittagong and the various restrictive and repressive measures taken against Hindu boys and young men there, outsiders may be under the impression that the people

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

of Chittagong, particularly the Hindus, have developed only one interest, *viz.*, terrorism, and specialized in it. But, the fact is, the cult of terrorism is confined to a minority of which the numerical strength is not known. The Chittagong people have developed other and different interests. During a few hours' recent visit we got acquainted with the Arya Sangit Samiti, an association which cultivates and teaches music; an electric supply company; the Chittagong Sahitya Parishat, which promotes the cause of Bengali literature and cultivates acquaintance with it; and a private girls' school which has got an enrolment of 240 pupils in the course of two years—and this in addition to a Government girls' school of longer standing, which has a larger number of pupils. Chittagong is the only mofussil town in Bengal which has a daily paper, *Panchajanya*. But that which took us to Chittagong was the ceremony of laying the foundation of a new cotton mills, which was performed by Mrs. Nellie Sen-Gupta. The Company is non-communal and has a strong board of directors. There is every probability of the Mills proving a great success. "The natural resources of the district of Chittagong and its neighbouring districts for cotton industry are immense. Over 3 lac maunds of raw cotton is grown in Chittagong alone. Its humid climate and large supply of skilled weavers in Chittagong and Noakhali, its port and its facilities in rivers and railways are special features suitable for Cotton Mills."

We have also had the privilege, during our visit, of taking part in the unveiling of two portraits of that fearless leader, *Desapriya* Jatindra Mohan Sen-Gupta.

Midnapur Magistrate has No Use for Mahatma Gandhi

The District Magistrate of Midnapur has written to Mr. B. N. Sasmal that it is undesirable that Mahatma Gandhi should visit his district just now. This does not mean that the Magistrate has no use for non-violence or a preacher of non-violence in that district. The Magistrate certainly wants that the people of Midnapur collectively and every individual non-official there should refrain from the use of force. As for officials in the executive and police departments, from the days of Lord Irwin, if not from an earlier period, we have been accustomed to the doctrine that minimum force may and should be used by them against non-officials, if necessary, when they indulge in civil disobedience and on other similar occasions, the choice of the occasions and the decision of what is the minimum being practically left to those local men on the spot. Moreover, we have been recently told in the Bengal Council by the Hon'ble Mr. Reid that some damage to non-officials' property in consequence of some activities of officials is unavoidable. Such unavoidable damage implies the use of minimum force by officials. Now Mahatma Gandhi, being a thorough-going "Non-violencist," may not subscribe to the doctrines of the justifiability of minimum force in the official sense and of the unavoidableness of some damage to non-official property on some occasions. So, if during a visit to Midnapur, he heard of such use of force and such damage, he might give frank expression to his opinion about them. This might lead to complications, which the Magistrate probably wished to avoid.

Moreover, though for the present Mahatma Gandhi has kept all his political activities in abeyance, nobody can forget or has forgotten that he is India's greatest political leader, the field-marshal in fact of India's non-violent freedom's fight. So his mere presence might rekindle the dying embers of the non-violent martial fire.

Indian States Protection Bill

Some years ago there was passed a Princes' Protection Act, on the main ground that some editors were blackmailers and the helpless princes required to be protected against such rascals. Since its passage, that Act has been made use of only twice or thrice, showing that among the seven hundred and odd princes and chiefs two or three have had some grievance remediable by that Act. The "liberties," such as they were, of *all* Indian journalists ought not to have been curtailed for such a trifling reason. These same rascally blackmailers have been again trotted out by Sir Muhammad Yakub in his Assembly speech in justification of the Indian States Protection Bill. He says some princes give feasts to journalists and present them with thick packets of currency notes. Supposing

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

that is true, the Bill ought to provide punishment for the bribing princes also, which, of course, it does not.

The new bill has been named the *States* Protection Bill. But though Louis XIV of France said, "I am the State," we have not got 700 Louis XIVs among us, nor has any prince declared that he is the State. So protection of the princes is not identical with protection of the States. It may be objected that the administration of the States must be protected. But as there is reign of law in very few States, the rulers' will being law, the princes and the administration are identical. So the name States Protection Bill is a misnomer.

It is the people of the States who require protection, rather than the princes. In very many States they are subjected to oppression and misrule. In most States there is no Press, and where there is any, there is not even as much freedom of the Press as there is in British India. So the people of those States in which there is misrule cannot ventilate their grievances within the States. Their grievances are ventilated, and that, too, rarely, in papers in British India. Even that means would practically cease to be available on the Bill becoming law. It has been and may be said that newspapers indulging in fair and legitimate criticism need have no fear. But journalists know to their cost that there is no definite criterion of fair and legitimate criticism, and that the tendency of all such laws is to increase the arbitrariness of the executive.

Another way in which the States' people could ventilate their grievances was to hold conferences in British India. But the new bill has a section which would enable the Magistrate of the place where such a Conference might be proposed to be held to stop such an assemblage of men. So, when the Home Member asked people to reconcile themselves to autocratic rule in the States, he was not joking!

The States, no doubt, require to be protected against conspiracies against them in British India and against *jathas* intruding into them from British India in order to overawe them. But the introduction of a Bill providing against these things long after the fate which overtook Kashmir and Al looks like elucidating the meaning of proverbial shutting of the stable-door a the horse has been stolen. Nevertheless, if a penalizing only conspiracies and *jathas* of above description be enforced in a communal manner, it may do some good the other clauses of the Bill should be scrap

It has been said that, as the Prince their nominees would sit in the Fed Legislature side by side with the representati of British India, if there be criticism the States in British India the harmoni working of the Federation would not possible. That is a funny idea. The differ Provinces would form parts of the Federa Is it intended or contended that th should not be any criticism of one Provi in or from another? If it be allowable, certainly is, for men and papers in Province to criticize and agitate against doings in another, why should the men papers in any part of British India prevented from having their say on happenings in any Indian State? S the States are not sacrosanct.

Mr. James made a speech in the Assem in connection with this protection bill f which it seems that the Government want Indian States to enact Arms Acts, as other the smuggling of revolvers, etc., by terro and would-be terrorists cannot be comple prevented; and so the princes want, sort of *quid pro quo*, that they should protected against British-Indian critici Is there a bargain like this?

In any case, it would be interesting know who among the Princes have asked protection. The contentment of the pe produced by good government according popular constitution, is the only sure protec and the only protection worth having who asks for protection against criticism a guilty conscience, and writes himself d as an imbecile or a tyrant, or both.

It has been surmised that the S Protection Bill would be an inducement the princes to join the Federation. But they really wanted such an inducement so, while they themselves want protec against blackmailers, they would themse be considered guilty of blackmailing.

Silver Jubilee of Hindusthan Co-operative Insurance Society, Ltd.

The celebration of the silver jubilee of the Hindusthan Co-operative Insurance Society, Limited, on the 13th February last at the Calcutta Town Hall under the presidentship of Dr. Rabindranath Tagore was a brilliant success. The striking progress which the Society has made bears witness to the practical idealism and foresight of its originator, the late Mr. Ambikacharan Ukil and of Mr. Surendranath Tagore and other active promoters, as well as to the ability and industry of its present general manager, Mr. Nalini Ranjan Sarker and his co-workers. We wish still greater progress and success to the Society than it has yet achieved.

Work Done by Bengal Industries Department

A press note has been issued on the work done by the Industries Department of the Government of Bengal in 1932-33. Considering the very limited resources at the disposal of the Bengal Government, much useful work appears to have been done by the Department.

The most noticeable features of the work of this Department during this period were :

(*i*) a new orientation of Government's Stores Purchase Policy ;

(*ii*) the appointment of the Board of Industries and the bringing into operation of the State Aid to Industries Act ; and

(*iii*) the inauguration of a scheme of economic reconstruction in order to attempt the solution of the problem of middle-class unemployment.

The Bengal Budget

This is the budget season. While provinces like Madras and Bombay have been able to draw up budgets showing small surpluses, the Bengal budget shows a deficit of more than two crores of rupees, amounting to about 40 per cent of the entire amount of the budget. This is not the first time that the Province has a deficit budget. Bengal has been the milch cow of the Government of India since the beginning of British rule. Bengal publicists have known this fact for years. And for some years past the Bengal Government also have been admitting that the Government of India have been taking from the Province more than from any two other provinces combined. It would not do to say, Bengal must suffer because she has the permanent settlement of land revenue. That settlement was not the work of the people of Bengal. If it must be unsettled, let the successors of those British administrators who were its authors break their pledges and do it. In any case, if that settlement was wrong, that mistake cannot justify the legalized spoliation of Bengal by the Central Government, which has been going on for decades.

Bill for Suppression of Terrorism

The Select Committee has made some minor improvements in the Bill for the supression of terrorism in Bengal. The death penalty for the manufacture, sale or possession of arms without licence has been retained. No wonder, Mr. N. K. Basu, one of the members of the select committee, has not signed its report.

Protection of the Name Khaddar

Mr. Gaya Prasad Singh's bill for the protection of the names Khadi and Khaddar, as applied to cloth woven in handlooms from handspun yarn, has passed through the Legislative Assembly unopposed. Bombay mill-owners had been making money by manufacturing mill-made Khaddar—that was the *raison d'etre* of the bill.

Renewed Trouble in Kashmir

There is trouble again in Kashmir. For, in the opinion of Sir Muhammad Iqbal, "*even* the administration of a British Prime Minister has failed to win the confidence of the people of Kashmir," etc., etc. Hence, the Muslim politician-poet, "in view of the alarming situation that has arisen (or has been made to arise ?), considers that the time has come when the Paramount Power should boldly face the situation with a view to insure lasting peace in this unfortunate valley." Will a Muslim Prime Minister and a Muslim Maharaja be able to insure lasting peace ? Alas, there is no lasting peace even in Germany, Austria, France, etc., where there is self-rule or what passes in the world for such !

Revolution Abroad

If the Bengal Government, backed by the Bengal Legislative Council, had the power, revolution or something like it could have been prevented in Austria, France, Nicaragua, Cuba, etc. But as these countries are not under firm British rule, there is much trouble there.

Russo-Japanese War Again

Moscow, Feb. 11.

Ominous details of Japanese military measures in Manchuria are enumerated by General Blaccher, Chief Commander, Soviet Far Eastern Armies, in an address at the annual Communist Congress. He declared emphatically that Japan was preparing for a war against the Soviet and had converted North Manchuria into a drill ground wherefrom to jump off to the Soviet. She had uudertaken tremendous strategical road, railway and air port construction and had accommodated one-third of the whole Japanese army there.

The Soviet was taking counter measures and had reinforced the army with the best units and mechanism, while the frontier was belted with iron and concrete "able to withstand even the strongest teeth of the aggressor."—Reuter.

Racial Discrimination in Railways

In Indian State Railways,

during the year 1932-33, out of 5,774 posts carrying a salary of Rs. 250 a month and over, 2,355 were held by Anglo-Indians and 1,252 by Europeans, and out of 2,654 posts carrying the same salary on the company-managed railways 512 were held by Europeans, and 1,165 by Anglo-Indians. The European and Anglo-Indian employees enjoy better conditions of service than Indian employees of the same grade. For example, the authorities of the East Indian Railway spend more money on one single school at Mussoorie which is reserved for European and Anglo-Indian children, than on all the existing Indian schools combined, maintained by them. The Indian employees and their families do not receive the same facilities for medical relief as the European and Anglo-Indian employees and their families do.

Subhash Chandra Bose's Views

In the course of a statement to the Press, sent from Geneva, Mr. Subhash Chandra Bose observes :

In the domain of our external policy, our own socio-political views or predilections should not prejudice us against people or nations holding different views, whose sympathy we may nevertheless be able to acquire. This is a universal cardinal principle in external policy and it is because of this principle that today in Europe a pact between Soviet-Russia and Fascist Italy is not only a possibility but an accomplished fact. Therefore, in our external policy, we should heartily respond to any sympathy for India which we may find in any part of the world.

In determining internal policy, it would be a fatal error to say that the choice for India lies between Communism and Fascism. No standpoint or theory in socio-political affairs can be the last word in human wisdom. The socio-political theories and institutions of the modern nations are the product of their history, environment and needs. They are liable to change and development just as human life is. Moreover, it should be remembered that some of the most interesting institutions the present day are still experiments. Time elapse before they could be declared to be suc ful, and, in the meantime, we should not mort our intellect anywhere. My own view has al been that India's task is to work out a synthes all that is useful and good in the different move that we see today. For this purpose we shall ha study with critical sympathy all the move and experiments that are going on in E and America. And we would be guilty of f we ignore any movement or experiment becau any preconceived bias or predilection.

Obviously Mr. Bose has kept an o mind.

The Late King of the Belgians

The late King of the Belgians, who last month as the result of a mountainee accident, fought during the last great war great ability and courage for preserving independence of his country against German invasion. This won him the miration of his people and impartial foreig

Separation of Burma

Many reasons have been assigned for separation of Burma from India. Bri real reason is that British exploiters wan exploit the vast mineral and forest reso of Burma without any effective opposi such as united Indo-Burman opposition prove to be if there be no separation.

Winston Churchill on the Last War

In his book on the "World Crisis" Winston Churchill asks : "What did the do which the Christian nations did not do i last war ?" As for the steps taken by sides to secure victory, he observes : "W all was over, torture and cannibalism the only two expedients that the civi scientific, Christian states had been ab deny themselves : and these were of dou utility."

SHOULD THE LEAGUE BE ARMED?

Reasons against an International Police Force

By WILFRED WELLOCK

THE failure of the Disarmament Conference has had one surprising result: it has caused a large number of prominent peace workers to espouse the cause of an International Police Force. The effect of this has been to place the demand for such a force in the very forefront of peace propaganda. For that reason the proposal, with all its implications, must be carefully examined.

The chief argument in favour of an International Police Force appears to be that it is the only condition upon which the Powers can be induced to disarm, since it alone offers the security which halting States demand return for a surrender of military power. In other words, "pooled security" is held to be essential to disarmament in this heavily-armed age. The case against the proposal is, in my opinion, overwhelming.

Is It a Police Force?

In the first place, the term "police" force is a misnomer, and gives a false impression of what is intended by the proposal. Indeed, the International Police Force is not a police force at all, but a military instrument pure and simple. Were its purpose to protect the world from pirates and brigands, etc., in certain waters, or in certain wild places of the earth, something might be said for it, but it is definitely intended to be used to subdue and coerce "offending" Powers. Police forces "lock up" offenders, have them tried and, if found guilty, put in prison. But you can't imprison a guilty nation, nor indeed a guilty Government, nor groups of war-mongers and armament-makers in a foreign land. The International Police Force would be expected to invade an offending country and if need be, to kill a larger or smaller number of its people, the innocent with the guilty, including women and children. It might indeed be used by a majority of States within the League of Nations, and be opposed by a minority group of States, and thus become involved in a world war.

Betraying The Real Purpose of The League

Thus we must ask whether the placing of a powerful military instrument—and it must be powerful to serve its purpose—in the hands of the League would not betray the real purpose of the League, since it would inevitably tend to make the League think in terms of military power and cause it to devote less and less attention to the methods of peace, whose use it is surely the supreme mission of the League to foster. The establishment of an International Police Force would unquestionably emphasize the idea that force is

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

indispensable to the maintenance of international peace, whereas what we want to see is the League becoming an effective peace instrument, appealing to and developing the great reservoirs of moral and spiritual energy which are available, but which have never yet been harnessed to the cause of peace. Furthermore, by introducing the revolver do we not jeopardize truth, and thus the cause of peace, since by exhalting the factor of "might," which has been the bane of the centuries, we tie ourselves to the very evil from which we desire to escape ?

An Imperialist League

Obviously the supreme purpose of the League of Nations, and by the fulfilment of which it will ultimately be judged, is to substitute moral for military force, and all the energy of pacifists and of pacifist organizations ought to be directed to making the League the world's most powerful moral instrument. But despite its many welcome achievements, we must face the fact that when the supreme tests arrive, the League collapses, either from lack of faith in the moral appeal, or because the Powers which control it are swayed by selfish and imperialist motives or considerations connected with the evergrowing menace of the class war. The Sino-Japanese conflict over Manchuria is a case in point. That issue provided the League with a golden opportunity of vindicating its moral power and authority ; but, for such reasons as I have named, it failed ignominiously to use it.

But then many other clashes are taking place between the Great Powers which are equally ominous—as, for instance, between Japan and the U. S. A., Japan and Russia, many Capitalist States and Russia, and between Italy, France and Germany over the control of certain Balkan States and even Austria. Moreover, does it require much foresight to predict at no distant date conflict within the League between Fascist and Anti-Fascist States, and ultimately between Fascist and Socialist (and Communist) States, whence the League would become the battle-ground in a momentous struggle for ascendancy in world civilization between two conflicting social ideals ? In view of the development of class war and of the attitude of capitalist Powers towards Soviet Russia, what Socialist or independent thinker would have confidence in a League of Nations' decision in a dispute between Japan and Russia, for instance ?

It is, therefore, clear that to place an International Police Force in the hands of the League as it exists today would be to present new temptations to Powers which even now were giving vent to imperialist ambition.

The League and Constructive Peace

To my mind there is something inherently antagonistic to the spirit and purpose of the League of Nations in the whole idea of an International Police Force. If the League is ever to be an effective peace instrument, it must endeavour to get down to the roots of peace by inquiring into the grievances under which nations and peoples are suffering into the oppressions of Imperialism ; into racial and emigration issues and into Minority issues, etc. This it should do fearlessly, governed by the single desire to find the truth and establish justice, brushing aside every barrier to these ends, all race and class prejudice, all the presuppositions of Imperialism. On these lines the League would soon establish its moral authority in the eyes of the whole world : WHENCE IT WOULD HAVE NO NEED OF A POLICE FORCE.

Surely, then, the problem of the Peace Movement is how to create Governments which will use the League to realize its great purposes. In advocating an International Police Force peace workers are starting at the wrong end of the problem, since what the League needs is moral authority, and since in present circumstances an International Police Force would almost certainly be used to further the ends of Imperialism and thus strengthen the very instruments of oppression which are the cause of all the fear and distrust that are today poisoning the wells of international intercourse and undermining the authority of the League. The real need of the League is moral authority, and this can only be secured on such lines as I have indicated.

Would an I. P. F. Achieve Disarmament?

Let us now consider the claim that an International Police Force would bring about substantial disarmament. Many sponsors of the proposal state that its inauguration would be accompanied by the abolition of all national military aviation and the internationalization of civil aviation. If they mean to hold on to that condition, they may as well give up the proposal at once, since Powers (like France, say,) which are feeling too insecure to disarm without pooled security while the military scales are decidedly in their favour, are not likely to disarm confronted with the possibility of an armed League in which they are in a minority. The very fear that the balance of power within the League might change, would prevent even the securest Powers from accepting any appreciable measure of disarmament, while such disarmament as they conceded would be made in the belief that they would be able to maintain their ascendancy in the League. Thus once you accept the proposal to set up an International Police Force, you are likely to be driven into accepting a minimum of disarmament "at the commencement," on the promise of larger instalments later on. Such a concession to militarism, however, would be no more likely to bear the desired fruit than has the undertaking of the Allied Powers to disarm recorded in the Treaty of Versailles.

So far from disarmament resulting, there is good reason to believe that an International Police Force would lead to an increase in world armaments, since Imperialist Powers would probably feel compelled to visualize situations in which they might be in a minority in the League and thus be called upon to face very powerful combinations of military force, including the International Police Ferce. Furthermore, the very existence of the International Police Force would tend to make its control the central issue among the Powers, and thus to divide up the League into groups of Powers, as in the pre-League days of the Balance of Power. The effect of these conditions would undoubtedly be to create among the Great Powers larger demands for military forces than ever before.

Abolish Exploitation!

Surely it is obvious that so long as the League is chiefly composed of States which are founded on exploitation, its moral authority will be almost nil. In these circumstances general disarmament is out of the question, while to arm the League would vitiate the position and actually lead to increased armaments. Not until the Great Powers have abandoned social and imperialist exploitation, are ready to take all their disputes to arbitration and to adopt the fullest and widest measures of international economic co-operation will the League be able to give the world peace and disarmament. This surely indicates the path peace workers ought to follow.

Technical Difficulties

In the above statement the technical difficulties to be overcome in operating an International Police Force have not been discussed, since I deemed it better to concentrate on the principles involved. But those difficulties are insuperable in a League composed, say, of Imperialist and Fascist States, some of which extol war. In these circumstances it would be impossible to prevent an International Police Force from breaking into fractions by reason of disaffection due to "nationalist" feeling. But that is only one of many practical difficulties which would have to be faced.

IN BAIGA LAND

By VERRIER ELWIN

IMAGINE the Garden of Eden after the Fall, Adam and Eve restored to a conditional tenancy in its glades and forests now ravaged by the sin of man, the whole area however neatly tidied up by the Forest Department, and the Tree of the Knowledge of Good and Evil fenced off in a closed koop of its own and reserved entirely for the use of officials. There you have Baiga Land, a country that seems utterly remote and infinitely old, having the romance of Eden without its plenty. For indeed the Gonds and Baigas will tell you that these hills formed the home of the first parents of mankind, and their modern descendants are almost as wild and naked as they.

Children in a Baiga Village.

Not long ago I went with Srikant and Panda Baba to Baiga Land. Srikant is one of Pandit Jawaharlal's 'old women' who is giving his life to the dangerous and lonely task of village service. Panda Baba is the leading Gond wizard of our district. You must know our Panda Baba. He is an elderly man of immense style and character. Like Sir Willoughby Patterne, he has a leg. His stores of knowledge appear to be drawn from the primitive origins of our race. He has a group of disciples whom he is instructing in the elements of magic. He carries a sort battle-axe but it is not your crude instrume of slaughter used by the masses—it is slend and delicate, but with a razor's edge. Pan Baba has great tact. See him wheedl three annas worth of ghee out of a reluct *mukkadam* with just that blend of push a deference that a Bishop might employ extract a financial grant from a Provin Governor! The shyest raconteur unburde himself when that sage old head begins nod appreciatively by his side. It essential that we should have this man the spirit with us.

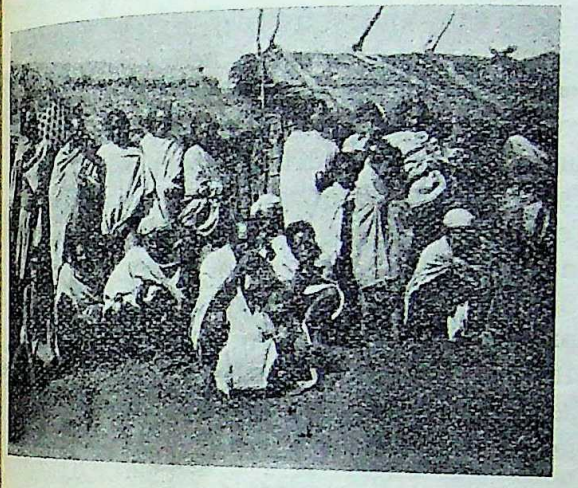
Away we went into the forest. O three or four visitors a year are dar enough to brave the journey even to Karan but Karanjia, for all its bears and tigers, i centre of civilization compared to this. D after day we plunged deeper into this w loneliness: at first we were in the livi forest—there were birds, we could hear t chatter of a monkey teasing a tiger, we wou meet people on the road. But later w reached the forests of Baiga Land whe hardly a bird rustles the leaves in th uncanny silence and where you may go t miles without meeting a soul. How thrill this forest is, with its endless trees which c close in upon you and now open wide to bare burnt glade, the trees sometimes tall the mast of some high Ammiral, sometim short and all their leaves withered by frost. The greens, the browns and the blac burnt grass make up a sombre but handso picture, while in the early morning when frost lies white upon the ground and t mist is rising from the streams or curli caressingly about the hills, the place is fairyland indeed.

The Baigas, thirty-seven thousand of th are to be found scattered all over the bl of Mandla, Bilaspur and Balaghat. Chhattisgarh live their more civilized desc dants, the Binjhwars; the Bhainas of Bilas

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

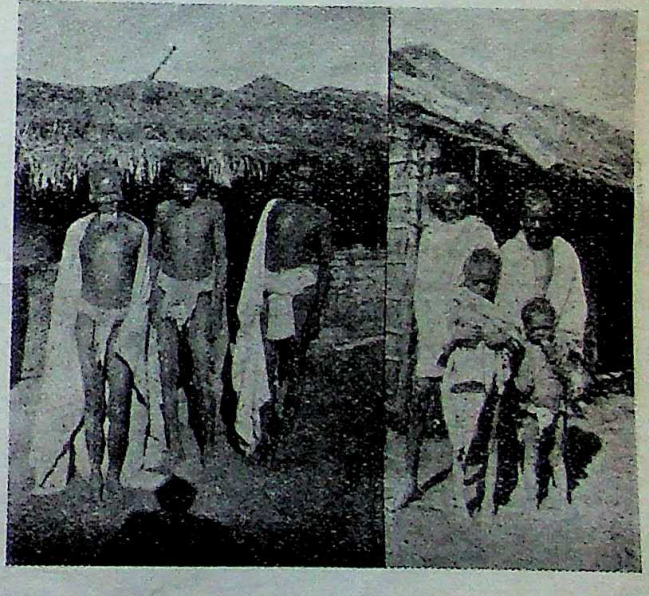
are in a left-handed relation to them; and the Bhuiyas of Chota Nagpur are regarded as another and perhaps the parent—branch of the same family. But you can read all about this in Russell's great book *Tribes and Castes of the Central Provinces.** All I want to do here is to tell of some of the villages we visited and of the things we heard and saw.



A group of Baigas. Hothu is sitting in the centre smoking.

At Dhurwari, a forest village in the Karanjia circle, we found the first Baiga settlement; and it was here that an elderly Ahir, squatting by our fire in the evening, told us that if we wanted to see real Baigas we must go to Ludra Taliyapani, Chakmaktola and Pakeripani. It added thirty miles to the tour, but such names were irresistible, and so early the next morning we started off by a tiny foot-path across the hills. I forget how many hills we crossed that day and night found us still climbing. It was quite dark when we arrived. But what a welcome we had! There was a well-ordered little hut for travellers, and in ten minutes the *mukkadam* had brought charpoys and seats and wood: two huge fires were made to keep out the bitter cold and soon most of the village were sitting round it, chatting away in the most homely manner. It was a strange and absorbing sight to see those wild handsome faces in the firelight, their long hair, their half-naked bodies. There were many old men, far more than you would see in a Gond village, and their ravaged faces had a great dignity. We made friends and went to bed, for we were tired.

It is always exciting to reach a place at night and then see what it looks like in the morning. We were not disappointed. Ludra Taliyapani is a typical Baiga village on the sun-lit rocky slopes of a tall hill, and everywhere there is a sea of hills and forest, save that in front you see below you the Maniari Lake which looks mysterious and lovely in the distance. A Baiga village is entirely different from a Gond village. In the latter every house stands by itself in its own field, and normally a home consists of four little houses arranged about a courtyard. But the Baiga houses are joined one to the other in a long row or round a very large square—tiny little houses they are, generally without proper doors, generally with walls of mud and straw roughly cowdunged. (The Gond house is of bamboo and is always neat and charming with a wash of white mud). But the Baiga houses have a very 'slummy' appearance and it is not easy to keep the great court clean. The Baigas wear more clothes than they used to, but they still wear less than almost anyone else and except when it is very cold, they like to go practically naked. The better houses are



Typical Baiga types. Baigas—old and young. It is a bitterly cold morning, hence the "Nanga" Baigas are wrapped in clothes.

* There is also some interesting material supplementary to Russell in the 1931 Census of India, Vol. XII, Part I, pp. 403 ff. My article is independent of either account, and offers much new material.

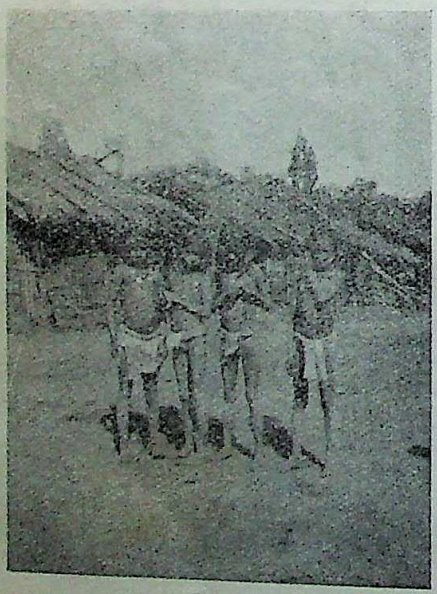
filled with a fantastic variety of oddments—bows and arrows, a stag's horns, peacock's feathers, rows of little packets hanging from the roof in which all sorts of treasures are concealed, a large bin for rice, a bed, some cooking pots, a fishing net and so on. In the poorer houses there are only the barest necessities of life. The Baigas live on *pej*—rice boiled in water—a little chappatti, and roots. They will eat almost any animal, but not monkeys, cats, dogs, vultures or beef.

We asked one old man about the days of long ago. 'Then it was Sukhiraj,' he said, 'How we used to eat in those days.' And his old face lighted with enthusiasm as he enumerated at least thirty articles of diet till everyone's mouth was watering. 'But now—a little *kodon*, disease and death: that is our life.' 'Yes,' said another old man, 'The world is full of evil spirits nowadays. We can't understand where the Gods have gone to. It is the Kali Yug.'



Are they to grow up as illiterate as their fathers?

The poverty of the Baigas is, without exaggeration, terrible. They are almost entirely illiterate. Many of them cannot add. They have no sense of distance. They say that a *kos* (normally two miles) is the distance between one pipe and the imperative desire for another. They are thus readily exploited by the money-lender and merchant. They used to make mats and other things and take them for sale in the markets, but now, they say, people stop them and take their things away from them, so even the few home-industries they have are dying out. No doubt they are lazy and thriftless, dirty and superstitious. The Gonds criticize them for their haphazard ways. 'They call up the spirits anyhow,' says Panda Baba, who is a rigid ceremonialist. But how courageous they are, how loving and loveable, faithful to their friends, honest with one another, and with what a heroic merriness of heart they triumph over all their sorrows. The women are less dignified, less distinguished than the men, a trifle hoydenish perhaps. The Gonds, I thought, might produce a Tess: the Baigas would hardly rise above an Audrey.

The Baigas are very old. The Gonds consider that they were created immediately after the beginning of the world. They themselves say that first there were Nanga Baigas, then Nanga Gonds and then Nanga Babas or Yogis, that is Hindus. They tell many different stories of their origin. Their ancestors, Naga Baiga and Nagin Baigin were born of serpents in the midst of the forest, and seeing their nakedness Parameshwar offered them a *dhoti* nine yards long. But they refused it as being unnecessary, and some gods who were watching the scene remarked, these are not Naga Baigas but Nanga Baigas. From that day they do not wash or dress. After this God himself taught them to cut trees and to sow their seed.*

Sitting by the fire we pressed them for stories. How did they spend the long dark evenings? Just sitting, they said. They knew no stories. Then Panda Baba came to the rescue, a touch of flattery, a hint at *bakshees*, and the thing was done. Hothu told us his tale. He did it very well, in intelligible Chhattisgarhi Hindi with just enough dialect to flavour it, with slow expressive gestures, long pauses and an inimitable trick of crumpling up his forehead at the funny bits.

An ant and a piece of charcoal set out on a journey. They came to a river and stopped to consider who should cross first. At last the coal went first and the ant followed him. The ant said, 'So a coal-black ant and a piece of coal have

* Russell and Mr. Ikramullah in the Census Report give different versions of this story.

Digitized by Arya Samaj Foundation Chennai and eGangotri

become friends !' After they had crossed the river the water became black. Presently a stag came to the river, and asked the water, 'How did you become black, O water ? Till now you were quite clear.' 'Hear me, O stag,' replied the water. 'An ant and a piece of coal have turned me black, and now I shall turn you lame.' The stag drank the water and went limping up the hill to find mahua fruit. When he came to the tree, the mahua asked, 'What is the matter ? An hour ago you were going to eat so much, but now you are taking nothing.' The stag replied, 'You belong to the plant caste and I belong to the animal caste, so what can you understand ? But as I became lame, so do you become small.' And the mahua who had been very large became small. The stag limped away home.

Then a bird settled on the tree and began to eat. 'What is the matter ?' it said. 'Yesterday I was satisfied with one of your fruits, but now with four or five I am still hungry.' And the mahua said, 'Hark to the tale of the cold-black water, the limping stag and the tiny tree.' When it heard it, the bird began to say *Chee-pee, Chee-pee*. It flew away and found a bar-tree for food. But it could eat nothing. All the time it flew to and fro saying *Chee-pee, Chee-pee*. The tree said, 'What is the matter ? Till now you used to come silently for food. Now you eat nothing and talk all the time.' The bird said, 'Hark to the tale of the coal-black water, the limping stag and the tiny tree ; the poor little bird that missed its dinner—and bitter berries shall grow on thee.'

Early in the morning the women of the village went to fetch water, and one of them was the sort of girl who is always eating this or that. She plucked some berries and began to eat. 'What is the matter ?' she asked the tree. 'Why are you so bitter ?' The bar-tree replied, 'Hark to the tale of the coal-black water, the limping stag and the tiny tree ; the chee-pee bird and the bitter berries—and now a pigmy thou shalt be.' She had been a tall woman : now she became small. She went home and when her work was done, she took *pej* to the men of the house in the fields. 'Come, brothers, eat,' she said, taking food out of the pot. 'Who is this ?' said the men. 'Our girl was tall, but who is this pigmy ?' 'Come and eat,' she replied, 'and I will tell you the secret !' When she had told them she said, 'Now you shall become bent.' And the plough-men's bodies became contorted.

All day long they ploughed and in the evening they went to their Rani. When she saw them she said, 'Ram, Ram, Ram, Ram, what has happened ? Tell me, for whatever you may say, you are my helpers and protectors.' 'Very well,' they said, 'Hark to the tale of the coal-black water, the limping stag and the tiny tree ; the chee-pee bird and the bitter berries ; the pigmy maid and the ploughmen three.' And then—

And then to my great regret, the story, though it would have delighted Chaucer, becomes—not indecent—but a little gross, and I had better stop. But I have told enough to show the kind of fairy-story they enjoy.

That night we had a dance under the moon. They did the *Daserah*, which is the origin of the more musical and sophisticated Gond *Saila*. In complete silence, save for the monotonous beating of a drum, the boys of the village went round and round in a circle which now widened and now contracted. Whenever there was a change of movement they uttered together a thin weird bat-like cry. After a time three old men walked into the middle of the circle and, huddled very close together, began to sing in faint piping voices. It was unforgettable—the high hills around, the lonely forest, the cold moon, those wild faces by the fire, and this unearthly fantasia of sound and movement.

A Baiga girl, who can now read and write, at the Montessori School of the Gond Seva Mandal at Karanjia.

Just before we left the next morning, I said casually to Hothu that if he wanted to tell one more story, there was just time. To our surprise and delight he said he would, provided that Panda Baba sat beside him. So we all sat down and he gave us this little folk-tale.* Whether it is genuine Baiga art or not, I am not in a position to say, but it is a good story—and as Hothu told it, it was twice as good.

There was a king who had six wives, but not one of them bore him a child. Daily the king

* Those interested in these things should read the story of Rai Linga in Mr. Trench's Grammar of Gondi, Vol. II. It seems to me that there is a distinct family resemblance between the two tales.

Digitized by Arya Samaj Foundation Chennai and eGangotri

would go hunting. One day he made a platform beside a lake and sat there watching for animals to come to drink. In the top of the tree sat the Queen of the Forest and she was weeping. Her tear-drops fell on the breast of the King. He called three or four servants, and said, 'Look, look, water is falling on my chest.' They all looked up into the tree but could see nothing. But there was a one-eyed man there and he cried, 'There is something there.' Then he called to the Queen of the Forest, 'Tell us, are you a *devata*, or a rakshas or a *bhut* or a *pret*, what are you? Come down.' But she replied, 'No, I dare not; you may beat me.' But at last she came down and they prepared her a splendid meal which she ate. 'It seems,' whispered the King's servants, 'as if she has not eaten for many a day.' She stayed with the King for a night and the next day he took her home with him.

When the six queens saw it, they said, 'So that is what he was up to when we thought he had gone hunting.' In the city the news spread quickly and there was great excitement. The citizens came to the palace to see the Queen of the Forest. Three nights passed and then with great ceremony the King married her. The other queens were very jealous: they would not talk with her, and she felt very lonely, especially as the King went out daily for hunting. Two or three years passed and then God blessed the Queen of the Forest with a child. She said, 'Look, my King, daily you go out hunting, and leave me alone here. Who knows what may not happen when the child is born.' The King said, 'I will put a big bell on the top of the palace, and when the child is born, ring it and I will come at once.'

At last the child was to be born and the King was away from home. In her pain the Queen of the Forest forgot to ring the bell. Then those six queens took her and pushed her into a grain-bin by the small hole at the bottom. Her beautiful son fell down outside. They took him away and put a stone in his place. It was so dark there that the poor queen could not see what had been born to her. They put the child in the buffalo-shed and hoped that the buffaloes would trample on it. After two days the King returned. They showed the stone to the King and said, 'Your jungly Queen has given birth to a stone.' He put his hands to his cheeks and with a face full of sorrow sat down. Then the Queen of the Forest was shaved in four places, and was sent away to work in the fields driving away crows. Then two of the queens went to see the baby and found a buffalo suckling it. So they took it to the goat-shed instead. After two or three days the old man and woman who used to graze the goats came to clean the shed and began to remove the grass and refuse. The woman found the baby and wrapping it in a cloth took it away. Then she called the old man and said, 'See, I have found the son of the Forest Queen in the goat-shed.' The old man killed a goat and made the signs of birth in his house and declared, 'In our old age God has given us a son.' Then he went to get milk-medicine for his wife. At last milk came from the old woman's breast and she began to suckle the child.

In eight months the child could sit and stand. In three or four years he could walk and run. He saw other children playing and asked his father to make him a bow and arrow. He ... green pigeons on the big tree and brought ... to his father. In his catapult were seven ... The other children often missed but this ... always hit the mark. The children used to ... on horses to the river to bathe, and so Lal (wh... was the name his foster-parents gave him) ... and asked his father to make a horse for ... The old man took twenty rupees to the carpe... and asked him to make a horse for his son. 'Y... must have it ready in five days,' he said. 'H... are ten rupees and in five days I will give ... ten more.' In five days he brought Lal his h... The boy kissed it and said, 'You are the h... that will take me to my mother.' Then he ... with the other children, driving his wooden h... They had a race, but the wooden horse went ... faster than any of the others.

Lal went home and took his food. Then ... went to the river where the six queens ... bathing and ordered his horse to drink. ... drink water,' he said. He dipped its wood... mouth in the water. The queens heard ... 'Fool, why are you asking a wooden horse ... drink? Has your father seen, or have you ... a wooden horse drink water?' Then the ... answered, 'That is all right. But have you ... or has your father seen a stone ever born to ... human being?' The queens began to mur... among themselves and their hearts beat fast. S... of them bathed, some did not. They return... home, but they took no food, but went and ... down on their beds. When the King came ... he was surprised because daily it was their cust... to give him water and to serve him, but on ... day they were all lying on their beds. 'What ... happened? Have you got fever?' he asked. T... told him what the boy with the wooden horse ... said. Into the King's mind the thought flash... 'Perhaps this is my true son,' and he sent ... soldiers to bring the boy to him. The old ... shivered with fright when they arrived deman... the boy. They wept and cried, 'What will ha... to our boy?' But Lal said, 'Don't be afraid,' ... he went off boldly to the court. There he ... the whole story, and when he had finished ... said, 'Go and bring the Queen whom you ... kept in your fields to drive away the crows, and ... I will prove all my story.'

Two soldiers went to bring the Queen of ... Forest, and when she came the King asked ... to stand on the threshold. Between Lal ... the Queen was placed a screen of seven ... thickness. Lal said, 'If the woman on the ... side of the screen is my mother, then if ... presses her breast, milk will flow: it will de... the screen and will come to my mouth.' Then ... Queen of the Forest pressed her breast and ... milk flowed out through the screen into ... mouth. He cried, 'See this is my mother. ... turned to the courtiers and said, 'You are ... men. Tell me, have you ever seen a stone ... of a human being?' They replied, 'Never. ... you are the Prince.' And so the King ... back the Queen of the Forest and he banished ... the other six queens from his court.

'And the moral of that,' concluded Hari... 'is that the greatest love in the world is the ... of children.'

Then back we went into the jungle ... away to the Baiga Chowk.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

The most characteristic thing about the Baigas is not their nudity, but their devotion to Bewar Cultivation. The Baiga selects a portion of the forest, fells the trees and sets the whole thing on fire. He sows his seed in the ashes and after the rains, gets his crop. After three years he moves on to another patch. But when the Forest Department began for the first time to take the jungle seriously, it became necessary to control the custom which was undoubtedly injurious to the forest. A block of 20,000 acres was set aside for the use of the Baigas, and Bewar was forbidden anywhere outside it in British India. This block is the Baiga Chowk. Here some seventy families have settled and still practise their ancient method of cultivation, though many of them have been persuaded to take to the use of the plough. But no Baigas plough save with a wistful heart. Bewar is their tradition: it is in their blood: it is the mark of their race: it is the sole reminder that they were once kings of the forest.

God himself came to their great ancestors as they were eating roots in the jungle and showed them how to do bewar, giving them the first seeds with His own hands. The Baigas have a passionate love for bewar. I have no doubt that this almost religious devotion is connected with their reverence for Mother Earth. Now, because of hunger and the strange days of the Kali Yug, they have to dishonour her with the plough.

I shall never forget Silpiri, the main village of the Chowk, with its dozens of children, its friendly people, its romantic setting. We had a wonderful afternoon of dancing there. For the Silpiri Baigas, dancing is a fine art: they have special dresses for it and a regular programme of different dances. First was the *Asserah*—for men only—as we had seen at Baliyapani. Then came the *Jarpath*, in which a row of boys faces a row of girls with two drummers in between. The rows advance and retreat, bowing and singing. There followed the *Tapadi* or *Reena* dance for women only. In the Gond *Reena* dances that I have seen, the women go round and round in a circle, bowing and making very complicated movements with the hands. Here there were two rows of women, who remained in a bowing position, sometimes turning their backs on each other, and for a time actually kneeling on the ground swaying to and fro. Finally there was the Baiga *Karma*, the famous dance that is common to many forest peoples. This was a little different from the Gond *Karmas* that I have seen. The men stood in the centre, a stationary pivot and a very large circle of women went round them. From time to time three girls and then a couple of boys detached themselves from the main company and went round and round the pivot very rapidly and in the opposite direction, their dancing being some of the finest I have witnessed.

Srikant was very busy taking down the songs, which he wrote out in Kanarese characters. In the evening we called Panda Baba, who was the only person who could understand them, even the singers being doubtful of the real meaning, and we got them translated. Here are some of them. It is interesting in view of the prevailing opinion about primitive songs, to note that not one of those we heard was indecent or even coarse in character.

The Baiga Karma.
The men and drummers in front, the row of women behind.

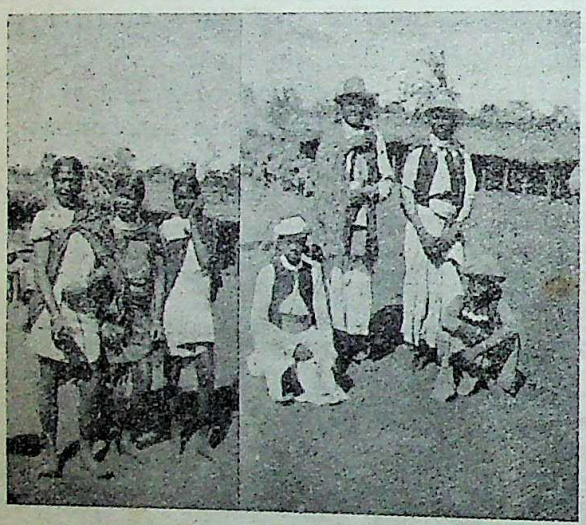
In All My Dreams

The wind and the rain are beating down;
Take shelter or your body will be drenched.
The rain is falling, falling.
In all my dreams I searched for you,
But I did not find even the echo of your steps.

I have built a fence by the roadside;
I have made a fence for my garden.
Where have you hidden, Thief of my Heart?
In all my dreams I searched for you,
But I did not find even the echo of your steps.

I have cut tall bamboos; I have cut short bamboos.
Large are the hollows of the dwarf bamboos.
The thief who crouched behind my fence has
hidden in those hollows.
In all my dreams I searched for you,
But I did not find even the echo of your steps.



Baiga girl dancers. Baiga boy dancers. The amount of cloth worn here and in other picture is exceptional.

The Monkey Chatters

From the top of the tree the monkey chatters.
Which brother carries the gun?
Which has the arrow and the bow?

Little brother has the gun,
Big brother has the bow and arrow.
Which brother says, 'I will shoot, I will shoot';
Which brother shoots the arrow?

Little brother says, 'I will shoot my gun';
Big brother shoots the arrow.

The Music Maker

There is One that maketh music on His flute.
But who careth for this poor forest-dweller?
No mother have I, nor brother, nor friend in all
the world,
But there's One who maketh music on His flute.
There is One who maketh music on His flute.
A mother have I, and brother, and friends to
eat with me.
But none of them can help this poor forest-
Save One who maketh music on His flute.

In the shade of the creeper sits a man;
The scorpion stings him and he weeps.
Who careth for the dwellers in the forest?
But there's One who maketh music on His flu

I Left Her

I left my love at Serguza.

Look at her neck with the necklace and the
wedding
O sleeper, rise...

The anklets make the ankles beautiful.
O sleeper rise...

How am I to know if our thoughts agree, O
Fri

O sleeper, rise, if thou wouldst see at midnig
the fig burst into

It has long been my ambition to be
to write to Mahatma Gandhi and tell
that I had met someone who had never
of him. Here surely, I thought, my
will find fulfilment. But no, everyone
his name at least, until at last they po
out an old man in a corner. 'He has
heard of him,' they said. Splendid, I tha
now I can write that letter. 'Because,'
continued, 'he has been stone-deaf for tw
years.'

The Baigas have very little idea of
outside world. 'Is there a place called
in India?' asked one of the most intelli
of them. Bombay and Calcutta meant no
to them. They thought that the marks
the moon were a stag. They have very
race feeling: they had no idea that I w
Englishman and thought that Srikant
came from the same home.

There is no time to describe the
villages we visited, and perhaps I should
set down some of the things the Baigas
us about their religious customs and beliefs.

Parameshwar is the ultimate God
object of worship is Bura Deo whose dw
is the saj tree and who is the same as Na

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

...n, the protector of the house. Parameshwar ...far away; but Bura Deo is near. Below ...m, and perhaps included in him, are many ...ser deities. There is Nang-Banshi who ...es in the great trees of the forest and ...wani Deo. Near rippling streams, by ...nes and bushes, dwells Bageshwar Deo, ...e lord of the wild beasts. The most friendly ...f the gods is Thakkur Deo who is a very old ...l and is worshipped with a white goat. ...hen he possesses a man, the villagers can ...ll him all their troubles and Thakkur Deo ...plains who are bad among them and why ...er suffer, what evil spirits should be avoided ...d how they can protect themselves. Narayan ...eo also sits in the courtyard and keeps off ...ny evils and diseases of far-off lands. ...illa Deo is another kindly God, for he ...ives away the evil spirits that would trouble ...marriage feast. He is worshipped with a ...d cock. In the cattle shed, Khut Deo is ...rshipped, for he is the God of cattle. ...ncestors live in the kitchen. Mahadev ...esides over the liquor-...p. Nag Deo is honoured ...th milk and flowers. ...e really mischievous ...irits are Bhut and Mashan. ...nt for the Baigas is a ...rticular spirit who stops ...e crops from growing and ...mes upon a man to give ...n fever. Mashan lurks ...stones and trees near the ...ghways and fields where ...can meet human beings ...d annoy them, spoiling ...eir bewar and robbing ...em of food. And finally ...trees and plants are ...nate with souls—'Other-...se how could they live?'

If you ask Panda Baba what the Gonds ...nk of Baigas, he will lean towards you and ...an amused and confidential tone—like that ...an Archdeacon unbending after his third ...gs of port, he will say, 'Well, you know, ...y clean themselves with leaves and not ...h water; and so we never eat in their ...ages.' And if you go on to say, 'But that ...ery odd, because you all revere Baigas as ...ur priests and gurus,' he will reply; that is another matter. You see the Baigas belong to the Earth. When Naga Baiga was born, Mother Earth was glad and gave him this boon that whatever his hands touched should prosper. The Baigas are so near the earth that the earth loves them and tells them her secrets, and so they can direct us in our sowing and they know where all the evil spirits are living and can help us to avoid them!

The Gonds call them, for example, for the Bidri ceremony at the sowing of the seed. The different families each bring a little seed which is placed under a tree. The Baiga pours milk upon it, and sacrifices several chickens. He repeats appropriate spells and burns incense. Finally he distributes a little of the seed to each family and they all give him something to drink.

The Ladu ceremony is intended to protect the house from sickness and other evils. A pig is dedicated for the sacrifice by having little pieces of its ear and tail cut off and

The Dasserah Dance

by being castrated. It is then kept for three years, and fed. When the time comes it is offered to Narayan Deo. It is laid across the threshold of the house, a plank is placed over its body and on this plank men sit. They move the plank to and fro, slowly crushing the unhappy animal to death.

When a man is killed by a tiger, the villagers, armed with guns, axes, bows and arrows, gather at the spot. A Baiga makes

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

a small image of the dead man either out of flour or earth, and places it on the very spot where his blood was shed. Then he tells a *katha*, beginning from the creation up to the time when the man was killed. By the time he has finished he will have fallen into an ecstasy, and leaping up, he rushes through

The Jarpath Dance. A line of boys faces a line of girls, with drummers in between.

the crowd into the forest. Then, roaring like a tiger and leaping in the air, he returns and tries to seize the image. But three or four of the bystanders catch hold of him and prevent him from going near it. Then they take a black cock and throw it in the air towards the forest, with the idea that if there is any tiger about, it will take the cock and leave them alone. At the same time they all shout at the top of their voices. By now the spirit of the tiger will have left the Baiga and he is able to carry the image down to the river. The people stand round in the water, holding a threefold thread. They sacrifice a chicken. Then they clap their hands to rouse Parameshwar and the Baiga says, 'For one generation let this spell endure. For two generations let this spell endure. From age to age let it retain its power. Drive the nail and break the thread. Let the dry cowdung sink, let the stones rise to the surface of the river, but let not this spell ever lose its power.' Then they break the thread and immerse the figure in the river. Afterwards they return to the forest and drive a nail into a tree or a great stone and repeat the charm. This, they believe, will close the mouth of tiger.

The caste-rules of the Baigas do not greatly from those of other tribes. The a village *panchayat* which supervises affairs. They will take food from Gonds not from the Brahmins, though the women not take from anyone. are put out of caste the following offen adultery with someone side the tribe; g worms in a wound; g to jail (though in places where no one been to jail for twe thirty years, they d know what the rule this is); being beate a shoe—the man who must pay one rupee, man who allows himse be beaten must pay killing cattle even by dent; if a woman her ear torn; if a man himself to be beaten by a woman—wh asked if there was any penalty on a man beating a woman the question was greeted roars of laughter; and for eating beef. anything that is done for the sanitation village, such as the removal of the corpse animals, etc. is not penalized.

We heard of a few superstitions. they hear the Kiddari bird, they do no on a journey. If a man sneezes once, it bad omen: to sneeze twice is good: to s three times is bad, and so on. Quiver the left eye is bad—in the right eye is They do not mind animals crossing the in front of them. If they strike their against a stone, they return to the house the stone is telling them that some dis may happen to their home.

I have not had the opportunity of s a Baiga marriage—the ritual is fully desc by Russell. For a divorce they take a straw, a piece of broken earthenware rupee. In the presence of the *panchayat* straw and the pot are broken and the rup given to the *panchayat*.

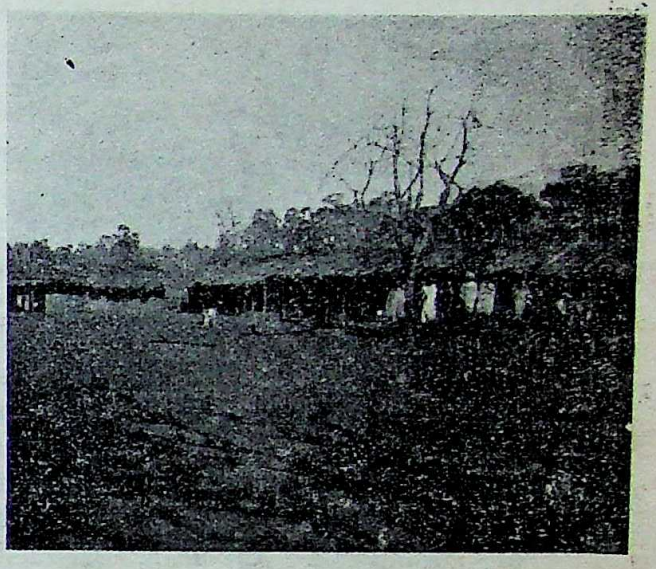
At death, all—good and bad—

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Parameshwar. There is no hell. But to do good pleases God, while to do evil grieves Him. The spirits are reborn in their own family circle. The disembodied ghost goes searching through the world for a place where it will be loved and at last returns to its own family. When a child is born, the *gunia* (magician) watches the child until it begins to drink its mother's milk. Then he declares that so-and-so has returned to the stormy ocean of existence. The Baigas are equally pleased at the birth of a girl or a boy. 'God knows what is best for us,' they say. The funeral ceremonies are simple. If the dead man has 'clung to his bed' for a long time, he is burnt; if he is young and has died suddenly, he is buried. A little money and cloth is placed in the grave, and some wine is poured out on the ground. 'You will not drink with us again, so take this now.'

As I look back over this article I see that I have allowed myself to forget for the moment the appalling poverty, destitution and ignorance of this heroic and fascinating people. But I am not really one of those anthropologists against whom Mr. N. M. Joshi would protect the forest people. You are certain to be enchanted by them, but you are equally certain to lie awake at night—and for many nights—haunted by the scenes of suffering that you have witnessed, and wondering what judgment must be passed on society that can calmly allow such things to continue from generation to generation. In a tour of a hundred miles we did not come within ten miles of a school or dispensary—indeed most of the way we were twenty or thirty miles distant from either. The Forest Department has refused the offer of the Gond Seva Mandal to open a school for the Baigas, in spite of an assurance that it would not be used in any way for political propaganda. But always the liquor shop was available: always there was a money-lender to entrap the people with interest at 50 p. c. or 33⅓ p. c. When we returned to Karanjia, we found the papers full of the terrible earthquake disaster and the relief that was going to the stricken area from all parts of India. But I said to myself, 'Here are people who live permanently under what are almost earthquake-disaster conditions.



In the Baiga Chowk

They die more slowly it is true: the fear that strikes their hearts is not sudden and dramatic, but it haunts them all their life—and only education can banish it. Scratching a bare subsistence from the earth, living often on roots and berries, shivering with cold under their scanty rags, the prey of all who care to exploit them, indebted, diseased, forgotten and despised, no one cares for this poor dweller in the forest.

"No mother have I, nor brother, no friend
in all the world.
But there's One that maketh music on
His flute."

Note: The above account of the Baigas will be found to differ from and to supplement the chapter in Russell which summarizes all the earlier literature on the subject. The differences are probably due to the very varied customs that obtain among the forest peoples in different districts But this article must not be regarded as a scientific essay. It is a preliminary excursion into a very large subject. I hope that in the course of the next few years I may be able to prepare a small monograph on the Baigas, and I would be grateful if anyone acquainted with the Balaghat and Bilaspur districts could suggest to me the best places to visit in this connection, and if anyone could lend me a copy of Col. Bloomfield's *Notes on the Baigas* and Ward's *Mandla Settlement Report*, or give me any other information or assistance.

ART OF BIOGRAPHY: AN INTERVIEW WITH GUEDALLA

By Dr. SUDHINDRA BOSE

I had a few days ago an interesting visit with Mr. Philip Guedalla, the brilliant English biographer and historian. Though of Jewish origin, Philip Guedalla is one of that rarest group of contemporary literary men who are appreciated in America as much as in their native England. During the last fifteen years, he has written more than a dozen books, in which he has given unforgettable pen-pictures of historically famous figures in literary, political, and military fields. His studies of Washington, Napoleon, Disraeli, Palmerston, and of Kitchener, Baldwin, MacDonald and others among the moderns, and his recent biography of Wellington have given him a rank and following possessed by few biographers. Turning the searchlight of his new historical methods upon literary figures, he has won equal fame as an interpreter of literature and its makers. It is no exaggeration to say that there are not perhaps many English men of letters who do not sigh for a Christmas gift of writing like Guedalla.

The general topic of our conversation was biography. With rapier-like wit, Mr. Guedalla discussed his idea and his ideal of the art of biography. In this conversation he did some expert operating on the popular conceptions of modern biography.

Mr. Guedalla said that he had met George Moore when he was working on the life of Palmerston and Mr. Moore advised Mr. Guedalla: "My young man, curve him like a vase." Charming and excellent advice as that might be for another type of literary art and for biographies of men whose lives obligingly started with a narrow neck, swept into the maximum bulge and receded gently to an artistic close, for the life of some men it was bad advice. Biography, Mr. Guedalla intimated, should be first of all true, and it was true of very few lives that they followed the conventional lines of the Greek vase. Telling a biographer to curve his subject like a vase would be like telling a driver of a street car to approach his destination in a voluptuous curve, Mr. Guedalla said. The problem of the biographer is not unlike that of the street car driver. They must both go where the rails lead.

Philip Guedalla is of the English Jewry, but as a speaker he is far superior to any of the visiting Englishry—especially English politicians—that I have ever heard in America. This is Mr. Guedalla's second visit to America. He has not only keen wit, satire and irony but has a background of scholarship. He has also been active in the public affairs of England. Graduated from Balliol College, Oxford, with a degree of first class in Modern History, he became a Barrister in 1913 at the age of 23. During the Great War, he served as legal adviser to the War Office and the Ministry of Munitions. Though he has retired from Government service, he still maintains an active interest in English politics.

Mr. Guedalla is as fascinating a talker as he is a writer. To me he was amusing about the phrase modern biography. There is no such thing as a modern biography in the sense that all biography, say after 1910, is brief and brilliant. In that very year there began appearing, he pointed out, a six-volume life of Disraeli and, what's more, in not one of the 3,000 pages does the expression psychological complex appear. And, on the other hand, nothing written since 1910 can compare with Lord Rosebery's life of the younger Pitt or his little memoir on Lord Randolph Churchill for brevity or brilliance. Moreover, rudeness, in which modern biography is supposed to shine, is child's play today compared to the really thorough rudeness of the 19th century posthumous memoirs.

The so-called modern biography attempts to reconstruct the motives of the subject. Emil Ludwig of Germany in the very first chapter of his biography on Napoleon pictures Mother Letizia suckling her baby Napoleon and purports to tell us what must have passed at that time in

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the mind of Letizia. It is utterly impossible, Guedalla observed, for any person to know accurately what any other person is thinking. The biographer can only deduce from the evidence and it is the duty of the really good biographer to sift that evidence, but it is not his duty to fictionize it.

Philip Guedalla did not actually mention Lytton Strachey by name as a biographico-fictioneer, but he referred to him subtly. Strachey, who passed away last year, was one of the prominent English practitioners of fictional biography. Anyone who knows anything about the subject of Strachey's biography may get some aesthetic pleasure from it, but God help the man who comes to Strachey ignorant and wishes to know the truth. The late Mr. Strachey was not in the truth business. His Queen Victoria has very little in common with the actual maiden and wife and widow who lived in the Windsor Castle. His General Gordon could never have worn a military uniform: his Florence Nightingale is but a series of epigrams about a war Nurse.

"The modern biography lives in a border territory," Guedalla said. "It is bounded on the north by history, on the south by fiction, on the east by obituary, and on the west by tedium."

The biographer must approach his subject from a factual viewpoint, said the English biographer-historian. If he uses guess-work in penetrating the motives and thoughts of his subject, he writes not biography but fiction. The interpretation of a biographer may be interesting and entertaining. Nevertheless, if his facts are wrong, his interpretation is wrong also. The biographer should always refrain from making statements of facts until he has found what the real facts are. Biography differs from imaginative literature in that a reader comes to biography in search of information. "He wants to know how this particular person was entangled with the world, what the conditions of life were, what did they to him, how he dealt with destiny, what he overcame, what overcame him."

Many biographers, intimated Guedalla, have condescending attitude towards their heroes, such as Andre Maurais of France has for Byron, Shelley and Disraeli. They often put more of themselves in the book than of the man they are writing about. A biographer must not see in his subject a chance for self-glorification. He should keep himself completely out of sight. The duty of the biographer is to re-create his subject after his subject's image, not after his own.

All the biographer needs is honesty of purpose, Guedalla said, and a reasonable degree of humility. A true biographer looks at and not down upon his subject.

Most of the modern biographies, according to Philip Guedalla, are done badly psychologically for they develop a single characteristic in their subjects rather than presenting a rounded character. It is a certainty that no human being is unchanged through life. In the cinemas and political cartoons and dramas it is the tradition that no character is allowed to have more than one characteristic: the good man, the extravagant woman, the innocent girl. The attempt to make the subject of a biography a supreme example of one characteristic from the first prattling to the death rattle is ridiculous.

There is a hybrid in modern biography, the mule called "Life and Letters." The life should be one thing, the documents another. No biography should be in more than one volume, is Mr. Guedalla's belief. Any life, even that of a king, can be gotten into one volume by a person who is writing a book and not letting the book write him. "Boredom begins with page one of the volume second."

Readers must view biography with a more critical standard, Mr. Guedalla asserted. Critics flatter and fawn upon the authors too much. Book-reviewers are afraid of being unkind to new works, because they fear posterity will remember them as "having killed Keats."

In America, England, France and Germany since the Great War, the demand for books "purporting to deal with real people and events and not fictional" has increased. This has led to an enormous biographical output. The novel has been able to maintain its volume of sales, but not its quality. No great novelists are arising to take the place of older masters of the novel form: Hardy, H. G. Wells, Joseph Conrad, George Moore and

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Galsworthy. The modern novel in England is increasingly coming into the hands of those who have nothing to say. That indicates failing health in art. Indeed, "the writing of popular fiction is no longer an art, but an industry."

Guedalla was not very enthusiastic over modern biography either. The field of biography is overcrowded with writers of little ability, because it is believed to be easy to write. Especially on the continent of Europe are biographies turned out in "mass production, and dumped in America and England on a terrifying scale."

In concluding the interview, Mr. Philip Guedalla repeated that the true biographer is like a Kodak. His business is to record facts and statements as they are, not as they might have been. Biographical writing may be likened to a faithful portrait-painting. The biographer should present his subjects not as demi-gods or supermen, but as the human beings they are. When Velasquez, the Spanish master artist, painted King Philip the Fourth, he drew him just as he was: fat, ugly and repulsive. Velasquez's work was entirely objective, and so should be every biographer's.

A PLANET AND A STAR

By NAGENDRANATH GUPTA

XLV

SILENTLY and swiftly sped the days and nights like our own good ship which moved in silence even like time. The meter indicated that we were rushing through space at terrific speed, but we had no other means of judging it. There were no mile posts on our unpaved roads, no stationary bodies which flashed past us. The heavenly bodies were so far off that they seemed as motionless as when seen from the earth. For the first few days the rapidly diminishing form of Mars gave us some idea of the rate at which we were flying away from it but it again became a red moon and later the red planet.

Narga made rapid progress with her studies in our language. In a month she learned a sufficient number of words to carry on a conversation in short, simple sentences. She was learning to read and write at the same time. She had a remarkable power for concentrating her thoughts on any subject she chose. She made us speak to her in our own language and quickly learned the meaning of every new word. We had a small collection of selected books including some volumes of poetry and sacred literature. These interested her greatly and she spent most of her time in reading them with me. She asked many questions about the history of the different peoples inhabiting the earth and made minute inquiries about their manners and customs. She pondered over the teachings of great teachers like the Buddha and Jesus Christ. Maruchi would explain to her the great achievements of science. Orlon was more often a listener than a speaker, though sometimes he made brilliant conversation out of the wide range of his knowledge. Narga could never listen to him unmoved and her eyes melted and her bosom heaved whenever he came near her. But the long years of discipline stood her in good stead and she controlled her feelings with admirable self-restraint. Her example reacted upon Orlon who kept a constant check upon his ardour and was content to let his eyes speak the love that filled his heart. Sometimes Narga would let him hold her hand for a minute and then she would gently withdraw it and look away from him.

Whatever may be said of other people love did not occupy all the thoughts of Narga. When she was not learning our language or reading our books she would engage us in serious conversation, discussing the teachings of the Master and the deep problems that have ever occupied the minds of great thinkers. We were most interested when she spoke about herself. She was utterly free from the slightest suspicion of egotism, and there was an impersonal manner about her which held a great charm. There was a strange duality in her personality which eluded and baffled us while it always won our admiration. She seemed to be able to come out of herself and to scrutinize her own self with cold criticism. We could not forget for a moment the price she had paid when she yielded to the imperious mandate of love and had abandoned everything she prized to follow the dictate of her heart. She had been the virginal priestess untouched by love and she had armed herself with such power that she could deal death by a touch of her lily hand. And yet Love had

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

found and vanquished her and was carrying her away as a willing captive to another world. But nothing could obscure her intellect or her marvellous gift of detachment. She was so earnest that neither vanity nor frivolity had any place in her nature. She was free from self-pity as well as self-consciousness. Sometimes a wistful look would come into her eyes and we knew that her thoughts were wandering to the domed temple at Opi and the hermitage of the Master. Sometimes the secret passage and the cloud-column of Raba would rise before her eyes, and she would lift her arms over her head, crying, 'Raba! Raba!' Again, these moods would pass and she would speak about herself with her characteristic detachment.

'Love has laid his rod upon me and I have kissed it. I made light of him and he has shown me his invincible power. I feel now that before we can know the greater love which embraces the whole race and extends to all living beings we must experience it in our own persons and cling to that other part of our own selves which means the mating of the two sexes. We can only renounce something that we have had, but how can we give up what we have never possessed? Somehow or other love must have passed me by in my previous lives, but I never knew that I had missed anything until I met one who came down from another world to claim and win my heart. The Master has loved no woman in his present life, but he must have done so in some past life, and in his present incarnation his love has taken the form of compassion for all mankind and all things having life. Since no man I saw in my country ever moved my heart I thought I had merely to follow the example of the Master and the time would come when all my heart would go out to my fellow-beings. I had no consciousness of any omission because I had no clear memory of my past lives. I now understand why the Master considered me impatient and why he would not look into my future. He left me wholly to myself so that I might find a way out of the predicament in which I found myself—the conflict between my heart and my sense of duty. And you see how I have fared in the conflict.'

What could we say? Although Narga was speaking aloud it was a sort of self-communion in which she took us into the confidence of her thoughts. Yet Maruchi ventured to speak and he said, 'Narga, you are far wiser than any of us, still we think you have decided well.'

Narga laughed musically and spread out her hands in a gesture of helplessness. 'What choice has the bird that is trapped? She can only flutter her wings, but there is no way of escape from the fowler's net.'

This set us all laughing and Orlon, who was looking very happy, said, 'But you are not alone in the net and as you see we are flying away with the net.'

'Yes, to your nest.'

'Is not that right? You will have to share my nest.'

'And that is why you are preening your plumes.'

The conversation took a merry turn and many were the quips and jests that passed between us.

So the time passed. Narga was so assiduous in her studies that in three months she had fairly mastered our language and could converse in it freely. Her fits of pre-occupation grew rarer though at times she was pensive and appeared to be lost in thought. As the days went by she looked forward more keenly to the near future and spoke less of the past and the memories she had left behind. She studied diligently the geography of our world and consulted maps so frequently that she learned all about our continents and countries, cities and towns, seas and rivers. The Earth ceased to be an unknown and unfamiliar object to her and she spoke about it and its peoples with accurate knowledge.

And all around us was the unsolved mystery of boundless space, the brooding Sphinx of unbroken silence. The stars were as far off as ever but they were steady points of light and did not flicker like candles in the wind. Night after night it was the same and yet not the same, because our thoughts were constantly changing and with them the mind-images of what we saw also changed. Narga sat up with us every night, watching the stars. Very often we remained silent for a long time, holding communion with our thoughts. Sometimes Maruchi spoke about the great wonder of the created universe and the perfect orderliness that pervaded it. Sometimes Narga would join the conversation and we listened to her and never ceased to wonder at her wisdom and the wide range of her thoughts. Gazing at the heavens one night she said, 'In our world we are astonished by the heights of the mountains and their great size and the sea fills us with wonder by the width of its extent and its great depth. But if you put all the heavenly bodies together how insignificant is the area that they fill in space! It is space alone that gives a real idea of vastness for it is really illimitable and immeasurable. You can measure the extent of the largest body in the heavens and you can even calculate its weight. Space alone defies all attempts to measure it. It is intangible only in the sense that it is not solid but for that matter water is as little solid and it runs out through the fingers if we attempt to hold it in the hand. We cannot clutch space any more than we can catch water. But we can sense space as well as we can feel the wind blowing around us. Space and time suggest to us the idea of the infinite. Of space we can truthfully say that it has neither

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

a beginning nor an end and it can be measured in no direction. And yet space is not invisible and you see the Infinite mirrored in it.'

One day, after Narga had finished her morning studies, I asked her, 'Do you still possess your wonderful powers? I ask you this question because I sometimes happen to touch your figures while handing you a book?'

We were alone. Maruchi and Orlon were in another part of the ship, Ganimet was steering and Nabor was sitting near him. Narga smiled and then sighed a little. 'No,' she said, 'I have not yet lost any of my powers. I have withdrawn the particular power you mention for fear of hurting any of you. But the time will soon come when all these powers will pass from me and I shall become like other women.'

I understood that she was referring to her approaching marriage.

'And you regret nothing? Speak frankly, for I claim the confidence of a brother.'

'Some regret is inevitable, for who can lose without a pang a treasure which has been acquired with much pains? But as I have told you all the greater love cannot be had without obtaining the lesser, and since I have missed the latter it has found me and pulled me back to the point from which I must make a fresh start. Sahir, my wise brother, have you never loved?'

'Not yet, my sister. If I loved a woman or had a wife I would not have been permitted to join this expedition.'

Perhaps you will find some fair woman to love when you return to your own country, perhaps you knew love in your past life. To me it has come wtih the suddenness and the power of a tempest sweeping all before it.'

Maruchi and Orlon came up and we spoke of other things.

XLVI

As the earth grew larger to the eye every night and the end of our long voyage drew near, Narga used to spend long hours watching the planet through the telescope. Soon she was able to distinguish the mountains and the wide expanses of the sea and to locate the continents. Of course, only a half of the surface of the planet was visible. As we approached closer to our own planet we noticed the moon waning and waxing in the two fortnightly periods while the earth loomed nearer and bigger every night. We were in communication with the earth and messages were being exchanged almost every day. We could hardly suppress our excitement at the near prospect of our home-coming.

It was the last night on board the ship for the next morning would find us back in the midst of our friends. We thought of the tumultuous welcome that would greet us on arrival at the landing place. Every one of us with the exception of the pilot was holding a pair of glasses to our eyes. Sleep was impossible though we wanted to lie down for a few hours after midnight. About that hour when we were still at a considerable distance from the upper strata of the earth's atmosphere, Maruchi suddenly shouted a warning and an order to Nabor. 'Reverse the engines! Don't enter the atmosphere. air. Keep cruising about at this height.'

There was a sudden jerk and the headlong descent of the machine was arrested. I turned to Maruchi in astonishment and asked, 'What has happened?'

'Look carefully through your glasses and you will understand,' said Maruchi, and he strode forward to Nabor to give fresh directions.

Peering intently through our glasses we observed what looked like luminous serpents darting through the air close to the earth. We knew of course that the apparent nearness to the earth was an illusion and the phenomenon we were witnessing was taking place at about a hundred miles from the surface of the earth. The space above the earth was alive with swift moving lines of light that flashed and faded every moment. Some of them were of astonishing brilliance lighting up the heavens underneath in long lines of dazzling light and then being wiped out as from a huge blackboard. A light like a shining star would suddenly burst into sight and disappear leaving a luminous trail which also vanished in a few moments. They rushed out from every direction and crossed one another, and as some went out of sight others flashed into view. It was the same wherever we looked. The earth appeared to be enveloped in magic lines of vanishing light. It were as if an invisible magician was entertaining his audience with feats of magic, and throwing innumerable balls of fire which went out themselves.

We were filled with wonder and awe. Narga asked, 'What is it? It is both beautiful and terrible.'

'It is a meteoric shower,' said Orlon.

'I have heard of it, but never seen myself,' remarked Narga.

'Sometimes forty years will pass without such a phenomenon being witnessed, and sometimes meteoric showers have been seen for two or three successive years.'

Maruchi came back slowly to where we were sitting and said with smiling courtesy, 'Narga, this is a display of nature's own fireworks in honour of your arrival on our planet. Half the world is watching this lavish exhibition of nature's pyrotechnics, the only difference being that, while people living in the world are looking up at this fiery shower we from our point of vantage are looking down upon it. It would be perilous for us to enter the atmosphere of the earth just now and we shall wait till the shower is over. We cannot risk a collision with a flaming meteorolite.'

Narga smiled at him and said, 'I must congratulate you upon combining the knowledge

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

the scientist with the accomplishment of the courtier.'

The machine was moving slowly in wide circles, hovering over the shower of meteors. For two hours we watched the shooting stars, and when it was all over we sought our beds to snatch a few hours of sleep if we could.

The first light of dawn found us out of bed and looking down at our dear mother Earth to which we were descending. I found Narga was also up and was holding a pair of glasses to her eyes. Maruchi and Orlon had not yet come out.

Narga knew that there was no Raba on our planet and consequently she was not surprised to see that the atmosphere of the earth was clear and there was no coloured vapour rising in the sky.

'Narga,' I said, 'we shall land an hour after sunrise. Have you brought the robe you wore that morning in the temple at Opi when we saw you floating in the air ?'

Narga's eyes widened a little in surprise and she said, 'Yes. Why do you ask ?'

'Please put it on now to oblige me. If you wear it on sacred occasions only I consider this a very sacred occasion in your life.'

Narga smiled and saying, 'It will be as you wish,' disappeared into her room.

Maruchi and Orlon came out. 'Where is Narga ?' asked Orlon, 'Is she still in bed ?'

'Oh, no,' I replied, 'she was here just now and has gone into her room to get ready for leaving the ship.'

I did not tell them that I had asked her to put on her sacred robes. That was a surprise in store for them.

Maruchi said, 'Let us don the robes that the monks at Opi gave us. We shall appear like the Magi of ancient times.'

Maruchi evidently wanted to present an impressive appearance when we landed. I smiled when I thought how insignificant we would look by the side of Narga.

We quickly performed our morning ablutions and put on the flowing monkish robes and the tall conical caps. We wore sandals on our bare feet.

Narga was still in her room when we came out, but a minute later the door of her room was pushed open and as she came out Maruchi and Orlon fairly gasped with astonishment. We saw again the same vision of beauty that we had seen in the temple at Opi and the splendour of the robes dazzled us with their magnificence. In addition, Narga was wearing some ornaments that we had not seen before and diamonds flashed on her throat and in her hair.

For a long moment we gazed at her, rendering her the silent homage of our eyes and then Maruchi said, 'Narga, you have dressed yourself as befitting so great an occasion.'

Narga looked at me demurely and said, 'I have merely obeyed the orders of my learned tutor.'

Maruchi nodded at me approvingly.

We looked out. The machine had slowed down and was moving through the air at a moderate speed. We slided back one or two window panels and the cold air rushed into the ship. Maruchi stretched forth his hand and said, 'Behold, Narga, your first welcome to your new world !'

Two fleets of aeroplanes lavishly beflagged, were approaching us from right and left. As they formed up on two sides of us Nabor greeted them with a blare of his musical instruments. Flags were waved and trumpets pealed in acknowledgment.

Narga looked at Maruchi and said, 'A flatterer need not tell the truth. The welcome is for you because no one here knows of my existence, but I gladly share your welcome.'

The sun was up and the morning light flooded the landscape below us. A few more minutes passed and then Orlon took Narga by the hand and pointed downward.

Down below was the landing place. The open space where we were to alight was strongly guarded and there was a cordon of police holding in check the immense crowd that lined the strong fencing round the open area. There was a sea of upturned faces and repeated cheers burst forth from a hundred thousand throats as our machine landed, ran along a short distance and came to a standstill.

The members of the organizing committee of the expedition hurried forward to meet us. Maruchi stepped down first and I followed him. Nabor and Ganimet came after me. The staid old gentlemen of the committee stared at our strange costume, but questions had to wait while very warm greetings were exchanged to the incessant cheering of the crowd.

And then the president, somewhat bewildered, asked, 'And Orlon ? Where is he ?'

'He is coming,' replied Maruchi with an inscrutable smile.

Even while he spoke Narga and Orlon came forth. Orlon helped her to step down on the grass and then the twain came forward, hand clasped in hand, and stood in full view of the multitude.

A sudden and absolute hush fell on the cheering crowds. The president and members of the committee gazed in dumb astonishment at the radiant and dazzling vision before them. The sunlight flashed on the robes and jewels of Narga while she stood in all the glory of her peerless beauty. There was a faint blush on her cheeks, but otherwise she was calm and quite self-possessed, while her lips were slightly parted in an enchanting smile.

Then Maruchi broke the silence. In a voice that thrilled the hearers he said, 'We went up to a planet and we have brought down a star.'

Narga's eyes shone like twin stars.

THE END

RABINDRANATH TAGORE AND THE RELIGION OF MAN*

By Prof. SAROJ KUMAR DAS

WITH his characteristic *naivete* of expression and the music of his style, Dr. Tagore offers in this present volume, as he lays down in the Preface, the gleanings of his 'thoughts on the same subject from the harvest of many lectures and addresses'—the subject being one of perennial human interest—the Religion of Man. The interweaving of this subject of religion—the acknowledged source of his 'inspiration'—serves to string together his discourses, on a protean variety of topics, into the connected chapters of a unitary volume. The easy and insensible transition with which the reader glides through the chapters of this book, clearly attests the fact that they 'are deeply linked by a unity of inspiration,' which is consistently left suggested and never actively dissected into arguments. That is what invests all his utterances with a peculiar forceful appeal, which is inexplicable otherwise. Being the consummate artist that he is, Rabindranath does not seek here to reinforce his thesis in the manner of the less gifted who would, in order to ensure cheap and easy success, "say it with" religion, and thus very often take the name of religion in vain. Indeed, this indefinable yet impressive 'unity of inspiration' is not a unity afore-thought—the result of perspiration—but becomes a unity in after-thought, directly it is 'brought into a definite focus' of self-consciousness and self-expression. This is as it should be; for our author is *par excellence* one of those that 'builded better than they knew.' Here is also to be found a fresh corroboration of Goethe's dictum that we never rise so high as when we do not know whither we are going!

To our mind what confers a unique value upon Rabindranath's presentation of the case for Religion is the candid confession, expressed with the force of an assured conviction, 'the Religion of Man has been growing within my mind as a religious experience and not merely as a philosophical subject.' (*Preface.*) This is as much a judgment of *fact* as a judgment of *value*. While laying a well-deserved emphasis on the experiential side of religion, Rabindranath does not altogether ignore the ideational side; for what he *enjoys* as the innermost experience of his 'personal life' he offers to the world at large to *contemplate* in 'its own ideal value.'

Apart from the autobiographical interest attaching to his presentation of the case for 'religion,' Rabindranath has pressed the right key in 'the Religion of Man.' With his prophetic insight he has herein restored the central fact to the centre, and reinforced the hometruth that Religion is an 'experience' of God and not a 'proof' of Him. Call it 'modernism' or call it 'mysticism'—it does not matter much. The thing is there and will speak for itself, without relying on philosophical labels, which are anything but instructive, if not positively misleading. Nowhere is the tyranny of 'isms' more acutely felt than in the sphere of religion. Indeed, what the world today seems to be suffering from is not so much the atrophy, as it is the hypertrophy, of the religious side of a man's nature. It is idle to deny that a man's religion, as at present circumstanced, stands in danger of being smothered or stifled out of existence by the rampant growth of its external paraphernalia. Thus the result has been—what it is always expected to be—that we cannot see the wood for the trees. The religion we need, therefore, is something different from the religion we have. But what we actually need is not a new religion, but a new orientation of religion.

Now, the appeal to experience, rather than dogma, in matters pertaining to religion, is admittedly one of the vital strands of Modernism and the spell of Modernism consists in stressing this point with peculiar emphasis. While fraternizing with this tenet of Modernism, Rabindranath makes no secret of his dislike for the so-called 'modernism,' which always makes an apotheosis of the present and the actual in studied ignorance of the claims of the Eternal and the Ideal. In one of his famous addresses on the spirit of Japan, he is reported to have said: "While I agree that the spirit of the time should harmonize with the spirit of the time, I must warn them (the modernists) that modernizing is a mere affectation of modernism, just as affectation of poetry is poetizing. True modernism is freedom of mind, not slavery of taste." The evidence of true modernism in Rabindranath—if evidence were at all needed—one finds in his steady refusal to chime in with the time-spirit, with the Soviet prescript, for example, of abolishing all religion. He has sufficient insight to realize that a phenomenon which has, from the very dawn of history, held its sway over men's minds cannot be a mere freak of nature. The thing for which men have cared to live or dared to die is not one that can

made or unmade at our sweet will. Symptomatic this modernist disparagement of religion is a ent work of Prof. Whitehead's—entitled *in the Making*—which affords an *ligion* structive comparison with *Religion of Man*. he comparison reveals a profound divergence respect of their characteristic view-points and ethods of approach. A thorough-bred rationa- r with a Cambridge training in scientific Prof. Whitehead brings to the searches, ecution of his task a rare specimen of rigorous linking and judicial neutrality which e average writer on the subject of religion is lly lacking in. Having reviewed the history of ligion in the growth of human civilization, Prof. Whitehead returns the verdict that 'the uncritical sociation of religion with goodness is directly gatived by plain facts,' and concludes with the ther startling announcement that 'religion is the st refuge of human savagery.' No more severe dictment on religion could be pronounced, and at in the name of historical scholarship or ientific accuracy. Rabindranath, however, stands a class apart and follows a different line of proach altogether. Indeed, his engrossing concern with *Religion*, and not with religions. He would t, of course, dispute the facts of religious intoler- ce and persecution that stare us in the face from ry page of the history of religions, but would ter from the wrong valuation that we so often ake of them. When doctors thus disagree in eir diagnosis, it is no wonder that they would ggest quack remedies. But Rabindranath, like e Bengal saint of hallowed memory, would set s face resolutely against these and exclaim: *Ebn bahya age Kaha ar*" (*i. e.* "This also is perficial, do talk of something deeper"). With s characteristic penetration, he threads his way rough the tangled skein of the external para- rnalia to the spot where the heart of religion nctuary, the *Sanctum Sanctorum*, and acknow- dge with him the idea of the humanity of our od or the divinity of Man the Eternal. Before that gh altar we are ordained into the redemptive spel that 'religion is the reconciliation of the per-personal Man, the universal human spirit, my own individual being.' It is, however, no r message that Rabindranath preaches in *The ligion of Man*. As early as in his dissertation the Meaning of Religion' (*Dharmer Artha*), had laid down: "The *dharma* of the hero is roism, the *dharma* of a king is kingship or vernment and the *dharma* of man is his manity—there being no other name to designate elf." Now, the basic 'reconciliation' of which speaks in *The Religion of Man* is frankly stical, and this description serves to bring out e peculiar excellence of Rabindranath's presen- tion of the case for religion. Here it is that e best appreciate the natural shortcomings of of. Whitehead's verdict on religion. Indeed, ext we take exception to in this verdict is not its crass realism, but its misplaced emphasis. The criticism derives all its plausibility from the identification,—and that an unwarrantable one—of the timeless essence of religion with its historical accidents. Believing, as he clearly does, that 'religion is what a man does with his solitariness' and that 'religion in its decay sinks back into sociability,' it is difficult to see how he can square this belief of his with the stricture he has passed on religion—making the decadent forms of religion the peg for this indictment to rest on.

Now to come to a closer grip with the detailed findings of Rabindranath in *The Religion of Man*. The one pervasive theme of the book, as he himself announces in the first chapter (entitled "Man's Universe"), is the 'idea of the humanity of our God, or the divinity of Man the Eternal' (p. 17) and 'he is God who is not merely a sum total of facts, but the goal that lies immensely beyond all that is comprised in the past and the present' (p. 206). This, his basic faith, he progressively justifies through the different chapters of the book. Man's universe 'is the sum total of what Man feels, knows, imagines, reasons to be, and of whatever is knowable to him now or in another time' (p. 23). Accordingly, 'the individual man must exist for Man the great, and must express him in disinterested works, in science and philosophy, in literature and arts, in service and worship. This is his religion, which is working in the heart of all his religions in various names and forms' (p. 17). Behind and beyond this universe there is the perpetual urge of the 'Creative Spirit'—'the consciousness in Man of his own creative personality'—of 'a Spirit which has its enormous capital with a surplus far in excess of the requirements of the biological animal in Man' (Chap. II, p. 43). Man draws upon this capitalized 'surplus' and 'through his imagination, which is the most distinctly human of all our faculties,' has to finish what 'has been left unfinished by his designer'; for 'in fact, man is a raw material for himself, which he alone must fashion into some difficult ideal of completeness upon a background which is bare.' But in this art of soul-making 'he is aware that he is not imperfect, but incomplete.' (Chap. III, pp. 54, 59). This urge of the 'creative spirit points to a 'spiritual union' which is not to be attained through the mind; for 'our mind belongs to the department of economy in the human organism.' It is to be attained only on a supra-mental level when 'we come into touch with the Reality that is an end in itself and therefore is bliss.' (Chap. IV, p. 67). A vision of this Reality was envisaged by the prophet Zarathustra in his conception of the 'House of Songs'—'Ye, who wish to be allied to the Good Mind, to be friend with Truth, Ye who desire to sustain the Holy Cause, down with all anger and violence, away with all ill-will and strife! Such benevolent men, O Mazda, I shall take to the House of Songs!' Thus spake Zarathustra, and his is the immortal glory to have

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

been 'the first prophet who emancipated religion from the exclusive narrowness of the tribal God, the God of a chosen people, and offered it the universal Man' (Chap. V, pp. 80,88). It is 'the vision' of the blissful Reality that ultimately counts; and Rabindranath makes the candid confession 'that my religion is a poet's religion. All that I feel about it is from vision and not from knowledge' (Chap. VI, p. 107). The vision reveals 'the Man of my heart'—the Supreme Man of whom it can truly be said 'that he is infinite in his essence, he is finite in his manifestation in us the individuals' (Chap. VII, p. 118). 'Our religions present for us the dreams of the ideal unity which is man himself as he manifests the infinite.' Thus the poet may be said to have given 'the best definition of man when he says :

> We are the music-makers,
> We are the dreamers of dreams.'

Truly, might man as 'the music-maker' say with Browning's 'Abt Vogler' : 'It is we musicians know.' For 'music, though it comprehends a limited number of notes, yet represents the infinite' (Chap VIII, p. 122,127-28). As already observed, man's 'true life is in his own creation, which represents the infinity of man' and 'imagination is the faculty that brings before their mind the vision of their own greater being.' Thus, 'man by nature is an artist' and 'art is the response of man's creative soul to the call of the Real.' (Chap IX, pp. 134, 139). Man's nature or *dharma* 'which represents the truth of the Supreme Man' is 'realized by our imagination, but not created by our mind,' and 'Religion consists in the endeavour of men to cultivate and express those qualities which are inherent in the nature of Man the Eternal, and to have faith in him' (Chap X, p. 144). 'Today, more than ever before in our history, the aid of spiritual power is needed,' so that 'this meeting of men' may prove fruitful ; and this is possible if we 'the dreamers of the East and the West keep our faith firm in the Life that creates and not in the Machine that constructs.' (Chap. XI, pp. 160, 163).

The teacher has to remember that the 'primary object of an institution should not be merely to educate one's limbs and mind to be in efficient readiness for all emergencies, but to be in perfect tune in the symphony of response between life and world, to find the balance of their harmony which is wisdom.' (Chap. XII, p. 178).

'As in the world of art, so in the spiritual world, our soul waits for its freedom from the ego to reach that disinterested joy which is the source and goal of creation' (Chap. XIII, p. 184) —is the very text of his discourse on 'Spiritual Freedom,' which forms, in our opinion, the pivot of the whole thing. Herein Rabindranath stands in the illustrious company of those seers and prophets of this ancient land of ours, whose message of spiritual freedom greets us once more across centuries of oblivion. When viewed in its doctrinal aspect, this message of spiritual freedom will be found to be in essential agreement with that philosophic tradition which the different schools of Indian thought unite in enforcing. 'Know thyself' and be free, know in a corporate as well as in an individual capacity, and endeavour ever afterwards to bring that corporate wisdom to a luminous personal focus—this has been the message of all alike. With no loss of meaning can it be expressed in the language of St. John—'And ye shall know, the truth, and the truth shall make you free.' Thus in doctrine sympathy with the prophet and the schoolman Rabindranath holds that 'bondage in all its forms has its stronghold in the inner self and in the outside world; it is in the dimming of our consciousness, in the narrowing of our perspective, in the wrong valuation of things' (p. 190). The peculiar efficacy and persuasiveness of his message consists in this that he does not offer it in the manner of a doctrinaire.

Now, what is it exactly that he seeks to convey by the phrase 'spiritual freedom'? To the average critic or thinker, with a realistic bias or empirical leanings, the phrase 'spiritual freedom' comes to connote, by way of misplaced emphasis, natural and easy enough, just the reverse of what its author seeks to convey thereby. Whatever else it might mean, this much is certain that 'freedom in the mere sense of independence has no content, and therefore no meaning. Perfect freedom lies in a perfect harmony of relationship, which we realize in the world not through our response to it in knowledge but in being' (p. 172). It is not merely in the religious context but 'also in the social or political field, the lack of freedom is based upon the sense of alienation, on the imperfect realization of the One' (p. 188). Rabindranath clearly anticipates this difficulty and solves it in his own inimitable way. 'But we know,' to quote his own words, 'that, though it may sound paradoxical, it is true that in the human world only a perfect arrangement of interdependence gives rise to freedom' (p. 188). Accordingly, the 'history of the growth of freedom is the history of the perfection of human relationship' (*Ibid.*) The freedom truly understood, that is, spiritual freedom, is taken by Rabindranath to be synonym, not of independence, but of 'interdependence' based on 'mutual understanding and co-operation.' This clearly explains the importance of the qualifying epithet 'spiritual' prefixed to the word 'freedom' ; without the prefix, it is a mere cipher, with it, it has a local value. When, however, it is taken out of its spiritual context and used without any qualification, it becomes a doubtful asset, if not a downright liability in the spiritual balance-sheet of humanity.

'As the day is divided into morning, noon, afternoon and evening, so . India had

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

...n's life into four parts, following the require-
...ments of his nature' (Chap. XIV, p. 197)
...—*brahmacharya*, the period of discipline in educa-
...tion; then *garhasthya*, that of the world's work;
...then *vanaprasthya*, the retreat for the loosening
...of bonds; and finally *pravrajya*, the expectant
...waiting of freedom across death' (p. 198). 'For
this fourfold way of life India attunes man to the grand harmony of the universal, leaving no room for untrained desires of a rampant individualism to pursue their destructive career unchecked, but leading them on to their ultimate modulation in the Supreme' (p. 202).

SOME LEGAL ASPECTS OF THE WHITE PAPER

By K. S. THAPER, B. A. (Hons.) (Oxon.)

THERE has been so much discussion in the country about the proposals contained in the White Paper on Indian Constitutional reforms that one would be led to believe every bit of it has been thoroughly analysed. But unfortunately the animated party discussions of a few very prominent topics (*e. g.*, the question of the reserved subjects; the safe-guards and the constitutional position of the Indian States) has prevented a fuller examination of other issues equally important, if not more so, for the actual working of the Constitution. These deal with the nature of the distribution of legislative functions between the centre and the provinces.

If we look around within the Empire we have considerably varying constitutions in existence. From a legal point of view the advantages which a unitary constitution, like that of South Africa, possesses over a federal constitution, are unquestionable. The interpretation of the constitution does not raise very serious difficulties.

It is known that the chief fact which turned Lord de Villiers into a vehement opponent of federation and induced him to throw all his influence as President of the South African Conference into the fight for the Unification of South Africa, was the experience of Canadian conditions derived from a careful study, during a visit to that country of the complexities of the Dominion Constitution. (Prof. Keith)

It is unimportant to discuss, at this stage, these relative merits, since it has been finally decided that India is to be a federation. If so, it is our duty to see that the constitution conferred on India is simple, concise and easy of interpretation. Already two important federations exist within the Empire, namely, the Dominion of Canada and the Commonwealth of Australia. Out of these two, the Australian Constitution raises much less difficulty in interpretation and consequently leads to fewer disputes regarding the respective jurisdiction of the federal and states legislatures. All powers are retained by the States except those definitely surrendered to the Federal Parliament in thirty-nine enumerated items. To find out the validity of an Act all that the courts have to do is to see if it falls within these thirty-nine items. "Federation in Australia," says Prof. Keith, "where defence formed no driving force, was the slow outcome of the most lengthy deliberation." On the contrary, in Canada, the case is quite different. To quote from the same authority,

> It appears to have been the laudable, if idle, hope of the framers of Confederation that they would be able to produce a measure which would so definitely assign to the federation on the one hand and provinces on the other their respective spheres of authority that no question of conflicts of law could ever arise.

And what they did for the purpose was to define two sets of legislative powers. Section 92 gives a list of subjects assigned to the provincial legislatures. But while the residue is retained in the Centre, section 91 enumerates some of the subjects retained. The effect of this is ruinous. "If so," continues Prof. Keith, "their hope was utterly defeated, for the number of complexities which have arisen regarding the interpretation of the Constitution is deplorable." The courts have to test the validity of every Act not by one but by two enumerated lists and the

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

test becomes even more difficult when it is realized that, "it is impossible to read even superficially the list of federal and provincial enumerated powers without seeing how they overlap and intertwine" (Prof. Kennedy). Consequently there are more disputes regarding the validity of various Acts in Canada.

It might easily have been expected that greater care would be taken to avoid this unnecessary litigation when the new constitution for India was proposed. No doubt the "historical circumstances—racial, linguistic, social, economic, geographical even sentimental" that tended to obscure issues in Canada are present in the case of India. But that is no reason why we must not yet learn a lesson from the experience of Canada and evolve a document that could avoid these complexities. On the contrary, the framers of the White Paper have gone even a step further to complicate matters. They have defined not one, as in the case of Australia, or two, as is the case with Canada but three different sets of powers. Section 111 enumerates exclusively federal subjects; section 112 enumerates those exclusively provincial, while section 114 contains a large list of subjects for concurrent legislation. So that the validity of every Act shall have to be tested by reference in turn to all the three lists.

In the case of Canada, 'the Act itself seems only on the heads of Agriculture and of Immigration to have realized that conflicts were unavoidable,' and in section 95 which provides for concurrent jurisdiction in this respect, it is clearly set down that in case there is a conflict the federal legislation will prevail. There is no such *definite* statement in the White Paper which reads :

> The intention of providing for this concurrent field is to secure in respect of the subjects entered in the list referred to in this paragraph, the greatest measure of uniformity which may be found practicable, but at the same time to enable provincial legislatures to make laws to meet local conditions.

But the "Federal legislature will not in respect of the subjects contained in list III be able to legislate in such a way as to impose financial obligations on the provinces." Does this mean any direct or indirect expense necessitated by the enforcement of the Acts ? Nevertheless, "In the event of conflict... the federal law will prev... unless the provincial law... receiv... the sanction of the Governor-General," and... that case repeal or amendment by fed... legislature is possible only with the p... sanction of the Governor-General. If t... Governor-General wishes to avoid poli... complications, this sanction is never likely... be refused. But that, however, is a mat... not so much of legal as constitutio... significance.

It is with regard to clauses 111 and ... that greater cases of conflict will arise. M... not even these exclusively defined pow... overlap ? It has been repeatedly found ... Canada that a particular Act regulating 'Tr... and Commerce,' which is a federal subj... may in another aspect encroach upon ... property and civil rights in the provin... which is an exclusively provincial preserve.

But otherwise the British North Amer... Act makes definite provision for fede... jurisdiction on the residual subjects. Fede... legislature can make laws "for the pea... order and good government of Canada, ... relation to all matters not coming within t... classes of subjects by this Act assign... exclusively to the legislatures of the provinces" and it is only, "for greater certainty, but n... so as to restrict the generality of the foregoi... terms of this section," that the legislat... functions in section 91 are enumerated.

When we come to examine the correspon... ing terms in the White Paper we find th... are very much complicated. The residue... powers is divided into two categories. ... undefined powers which are merely of a loc... or personal interest belong to the provinces... With regard to the rest "provision will b... made enabling either the Federal Legislature ... any Provincial Legislature to make a law w... respect to a residual subject, if any, not fall... within the scope of any of the three lists." So that both the Federal Parliament and t... Provincial Legislatures can pass laws concer... ing the undefined powers. The only safe-gua... is that for the introduction of such an Act in... previous sanction of the Governor-General ... required. Is it certain that both the Federa... as well as some Provincial Legislature will ... pass a law dealing wholly or partia...

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

overlapping the same subject? It has been found in the case of Canada, as Prof. Keith points out, that "there has been no rule of disallowing merely because an Act may be doubtful in legality..." So that the Governor-General is likely to leave that to be settled by the law-courts. The Indian States are in a much happier position from this point of view, as they retain all powers which they do not definitely surrender in the Instrument of Accession.

Clause 118 is specifically included "in order to minimize uncertainty of law and opportunities for litigation as to the validity of Acts." Will it succeed in this purpose? It provides for a time limit in which "an Act may be called into question on the ground that exclusive powers to pass such legislation were vested in a legislature in India other than that which enacted it." After the time limit is over the validity of the Act, however much it might encroach upon the preserve of another legislature, is established. So that the Central Government and each of the provinces will separately keep a legal department ever watchful and to bring up at once any Act, where there is a doubtful point involved, to the law-courts for some sort of a *declaratory judgment*. If the Act was left unchallenged till a particular case arose, it may be too late to upset it. In the case of 'The John Deere Ploug Company *v.* Wharton' which arose with regard to the British North America Act the judges declared that

> the structure of sections 91 and 92 and the degree to which the connotation of the expressions used overlap render it . . . . unwise on this or any other occasion to attempt exhaustive definitions of the meaning and scope of these expressions . . . It is in many cases only by confining decisions to concrete questions, which have actually arisen in circumstances the whole of which are before the tribunal, that injustice to future suitors can be avoided. . .

Any such prudence will be impossible in the case of India if these proposals in the White Paper remain unchanged.

Section 122, though not very much to the point, may be referred to in passing. It prohibits any sort of discrimination except legislation "which prohibits sale or mortgage of agricultural land in any area to a person not belonging to some class recognized as being a class of persons engaged in, or connected with agriculture in that area or which recognizes the existence of some right, privilege or disability attaching to the members of a community by virtue of some privilege, law or custom having the force of law." We are not concerned to point out the reactionary nature of this clause but it is of utmost importance to note that any such Act may be brought up to the courts to examine whether it actually does deal with existing privilege, law or custom. It is these vague half-defined powers that are always the source of litigation.

This part of the White Paper is so unsatisfactory from a legal point of view that it is likely to usher in an era of litigation in India on constitutional questions, such as has not been experiened anywhere before. It is still time to define it better. Whether the residuary power is given to the federal legislature or to the provinces is a matter, though of great constitutional and political significance, which does not concern the legal aspect of the document. But whether it is the jurisdiction of the federal legislature or the provincial legislatures, that is defined, there must not be more than one set of powers enumerated, the rest belonging to the provinces or the federal legislature, as the case may be.

RAMMOHUN ROY

By MADAME L. MORIN

IT is with the deepest sympathy of heart and mind that I associate myself to this commemoration of Rammohun Roy's memory. Leaving aside my own insignificant personality, I am proud and happy that France should be represented here and also have the honour of paying homage to this great awakener of India. France has always struggled for and proclaimed the ideals of truth and liberty, the ideal of high and impartial knowledge, which were also his ideals. It is not without emotion that I recall how keenly conscious Rammohun was himself during his lifetime of this link between his ideals and those of my country.

I have been asked by the Indian Institute in Paris to convey to you their tribute of admiration and respect for the personality and the work of Rammohun Roy. The Indian Institute also celebrated the centenary in Paris, but only after I had sailed for this country.

All that I have seen and heard since I have come to your country, has encouraged and confirmed me in the intention of writing the life of Rammohun Roy in French. I have already been working on the subject for some time in France; and although Calcutta is really the place where one ought to study Rammohun Roy, I have been able to discover in French Libraries one or two facts which, if they had already been alluded to, had never been thoroughly established and accurately verified.*

When I first started the research, I was told by the most competent people that it was like looking for a needle in a haystack. And I must confess that I had to spend long weeks of patient perusal of reports, proceedings, and especially of the daily papers of the time before getting any results. But in the end I have been able to establish the exact date of Rammohun's presentation to King Louis-Philippe,—14th October, 1832—by the ordinary usher of the ambassadors. This date is mentioned by two different daily papers of the time.*

Further, by consulting the most ancient volume of the proceedings of the Asiatic Society in Paris, in manuscript form, I have been able to prove that Rammohun Roy was effectively nominated as a member of that learned body as early as the 5th of July, 1824. There are interesting details relative to that nomination, but it would be too long to mention them now.†

Another point upon which a little light has been thrown, is the question of the *duration* of Rammohun's stay in France. Miss Collet says, in her biography of the Raja: "We do not know when he went or when he returned."‡ In fact, the stay of Rammohun Roy had up to now only been located vaguely between the 31st of July 1832 and the 31st of January 1833, both these dates corresponding to letters written by the Raja from England.§

In Mary Carpenter's *Last Days of Rammohun Roy*, however, there is a photographic facsimile of one of Rammohun's letters dated 22nd September 1832 and written in Bengali. I had the idea of showing this letter to a Bengali scholar in Paris, Dr. B. K. Ghosh, and he was able to tell me that it had been written from England. Therefore, on the

2nd September 1832, Rammohun Roy was still in France yet. On the other hand, I found in the Paris National Library an article of Pauthier in the *Revue Encyclopédique*, dated December 1832, where Rammohun Roy's visit is mentioned *retrospectively*. These two points enable us to curtail the conjectural period of Rammohun's stay in France by at least three months and we are thereby able to limit the researches to the last week of September and the months of October, November and December 1832.*

A full-size photograph of the above-mentioned Bengali letter is to be found in the present exhibition of Rammohun Roy's relics organized for the duration of the centenary. In France we have a Victor Hugo Museum, a Rodin Museum, etc. If I may be allowed to express a wish, I would suggest that the precious relics of your national precursor should likewise become the nucleus of a Rammohun Roy Museum. They would thereby become available to scholars as well as to the public at large, instead of remaining dormant in the seclusion of private collections. If the expense of a separate building cannot be incurred, surely one of your public museums or libraries could spare a small room and give hospitality to those relics.

What seems to me the most striking characteristic of Rammohun Roy is his powerful personality—unique and admirably concentrated, and yet infinitely rich and diverse, dynamic as well as comprehensive. I consider him as the most wonderful prototype in modern times of your Indian genius, which is not limited as the Western genius is by the principle of contradiction, but manages to combine analysis and synthesis. Diversity, more often than not, results in dispersion. But, while Rammohun Roy concentrated a great diversity of interests, yet his mind remained so concentrated, his discrimination so lucid, that he could co-ordinate the various factors into a harmonious whole; and his purpose remained so firm that he could focus his magnificent ideals into practical realization.

He was powerful enough to draw from East and West, from every religion, from all cultural traditions, and clarify all these diverse elements, to wield them into a lofty and rational philosophy, a universal religion.

And yet, personally, I do not believe that Rammohun Roy's greatest achievement has been the creation of a new religion. Before him, India had had many outstanding philosophers and religious men; I know that he was very deeply religious at heart, but as far as his action and influence are concerned, he appears to me particularly significant as a social reformer. I am even strongly inclined to think that most of his outward religious activities (as distinct from his own inner life) were conducted in view of practical aims, ethical reform being viewed as the soundest basis for a new social and political order where Indians could enjoy higher cultural enlightenment as well as a better standard of health, welfare and general prosperity. This can be substantially inferred from many passages in his writings.

Some people stand for undiluted orthodoxy with all its nefarious forms of superstition; others, on the reverse, see no other way of salvation than doing away with religion altogether. Rammohun Roy was determined to do away with the superstitious practices which had undermined India's lucidity and vitality; but in his wisdom, he realized that the religious instinct corresponds to such a vital need, that it cannot be easily uprooted, either in individual man, or in the evolution of large collectivities. He realized through the study of history how potent that force had been in the development of human civilization. He understood that the right course was not to suppress it—it cannot be suppressed—but to purify and simplify it and to use it as a means to serve social equality and fraternity as well as political emancipation.

From a purely philosophical point of view his partiality to the Hindu doctrine is evident. He finds in the Gayatri, the Upanishads and

* It is however likely that Rammohun Roy had already returned to England by December, and even perhaps as early as November, since a letter of Adam Sikin written in October 1832 is the only letter which we know of referring to the Raja as being in Paris at the time; his presentation to the king took place on the 14th of October, and we can infer from certain letters that the Raja only stayed a few weeks in Paris, and that he curtailed his stay owing to difficulties arising from a language which was foreign to him.

the Vedanta all the spiritual nourishment that a human soul can crave for.

But, on the other hand, he is struck by the social welfare and political progress of Europe; he also becomes acquainted with the moral precepts of the Christian gospel, and he concludes that this simple code of morality has been one of the chief instruments of the social and political achievements of the West. This is not the place to discuss how far this inference is founded, but I feel certain that it was the basis of Rammohun Roy's eagerness to diffuse Christian ethics among his countrymen.

Many passages could be quoted to substantiate this view; I shall limit myself to one or two.

> I presume to think that Christianity, if properly inculcated, has a greater tendency to improve *the moral, social and political state of mankind* than any other religious system."
>
> "Everyone who interests himself in behalf of his fellow creatures would confidently anticipate the approaching triumph of true religion should *philanthropy* induce you and your friends to send to Bengal as many serious and *able teachers of European learning and science and Christian morality unmingled with religious doctrines*, as your circumstances may admit, *to spread knowledge gratuitously among the native community*, in connexion with the Rev. Mr. Adam...."* (Letter to Rev. Henry Ware, Unitarian minister of Harward College, Cambridge, United States, in reply to an enquiry of his, dated February 1824. Quoted in pages 87, 88, of Miss Collet's Biography). (Italics ours).

Every word of Rammohun's declarations has to be read very attentively, if one wishes to understand his real thought underlying the studiously cautious and courteous language.

His religious point of view can also be understood by a careful perusal of his "Humble suggestions to his countrymen Believers in the One true God," where he says about non-unitarian missionaries that "When they endeavour to make converts of us;...even then we should feel no resentment towards them, but rather compassion, on account of the blindness to the errors into which they themselves have fallen. Since it is almost impossible, as everyday's experience teaches us, for men when possessed of wealth and power, to perceive their own defects."

* Mr. Adam was Rammohun Roy's "convert" to Unitarianism. (*Vide* Miss Collet, p. 66).

Religion and Philosophy are opposed [illegible] some progressive Indians on the ground [illegible] they are a source of division among themselv[illegible] Another point that Rammohun Roy discern[illegible] with marvellous lucidity is that it would [illegible] far wiser and more realistic to make [illegible] great religious force of India a comm[illegible] instrument of unification, a common basis [illegible] constructive action. This can only be d[illegible] in the broad spirit of tolerance which anima[illegible] Rammonun Roy himself. And Rammoh[illegible] as a matter of fact, did not limit himself [illegible] preaching tolerance, which is only a first stag[illegible] he personally practised understanding.

He was the first Indian brave and h[illegible] enough to break the rules of orthodoxy a[illegible] cross the Kala Pani, to come and stu[illegible] the culture and institutions of Europe with [illegible] open mind, and to observe Europeans a[illegible] their mode of living with a critical-sympathetic—curiosity. And I believe t[illegible] intellectual curiosity has been one of the m[illegible] important traits of Rammohun's remarkab[illegible] personality. Without this universal criti[illegible] curiosity, he would no doubt never h[illegible] dreamt, and never have achieved as much [illegible] he did in every field of human thought a[illegible] activity. Curiosity leads to comparison, [illegible] confrontation of values, to eager desire [illegible] knowledge of all forms of civilization. T[illegible] is why Rammohun Roy was the first [illegible] perceive, by a prophetic and generous visi[illegible] what cultural fellowship between East a[illegible] West could bring to both parties if it w[illegible] understood in the right spirit: how much [illegible] could broaden the field of research, how fa[illegible] it could enrich experience and human und[illegible] standing, how enlivening it could prove a[illegible] mutual stimulant, how powerfully it co[illegible] foster international brotherhood.

Apart from all these exceptional g[illegible] Rammohun Roy was also endowed with [illegible] specific qualities which make a man a [illegible] leader.

First of all, he was a realist as well as [illegible] idealist. Everything that he preached by w[illegible] or pen was instantly translated by him [illegible] constructive action or active struggle. [illegible] personality is all aglow with inspiration, [illegible] it possesses also this healthy sturdiness, [illegible] sound and perfect balance, which only c[illegible] to those who do not refuse to act, but brav[illegible]

except to grapple day after day with hard and unpleasant realities.

Secondly, Rammohun Roy possessed an indomitable energy. He belonged to that type of people who are never curbed by circumstances, but who fight to dominate them until their aim is realized. This untiring perseverance in effort could be illustrated by more than one instance taken from the Raja's life. (Among other facts, let us recall how he created his own press amidst the greatest difficulties, when he was refused hospitality by the press that had printed his previous pamphlets relative to his controversy with the missionaries).

As all real leaders who deserve that appellation, Rammohun was a selfless man, he gave the first place to his cause and not to himself; he was always ready to recede into the background when he thought it necessary; his attitude in the fostering of educational reform is characteristic of this.*

Always tactful and courteous, he remained implacably firm when essential principles were at stake, thereby commanding respect from his opponents. In our time, many so-called leaders are apt to shirk responsibilities; Rammohun Roy had such a keen conscience in that matter that he would rather go out to meet responsibilities in anticipation, with the most daring courage. We are inclined to forget that Rammohun was a rebel in his own time; in this respect also, his example is a great lesson. He never allowed himself to be excessive or fanatical; he was a self-possessed, generous, realistic and intelligent revolutionary.

His was a fearless life,—a lonely life also,—but he was powerful enough to stand alone and remain all the greater; as sometimes, at dawn, a tall mountain peak appears in isolation against the pale sky, shining already while everything is still in darkness, proud and fully radiant as the first herald of the rising sun.

Mrs. Naidu, in one of her inspiring speeches, very appositely said that Rammohun Roy had felt the challenge of the past. I know that the Indians of today feel the challenge of Rammohun Roy's lucid and generous vision. Your great precursor has been dead for a hundred years, but his powerful ideals are alive in the heart and mind of everyone of you today. Some of the reforms which he has struggled for have already been realized; it will be your privilege to complete the work and reach the goal. May this date of Rammohun Roy's centenary inaugurate the incarnation of his prophetic dreams into tangible and constructive realities.*

* Evidence given by Dr. Alexander Duff, before the Select Committee of the House of Commons in 1853. Quoted by Mr. Hem Chandra Sarkar in his introduction to the last edition of Miss Collet's biography. Page xxxix and xi of Introduction.

CAUSATION OF NORTH BEHAR EARTHQUAKE

By D. C. NAG

The possible causes of earthquakes are:

(*i*) Fall of rock at the surface or underground.

(*ii*) Explosions generated by percolation of water through the outer crust to highly heated rock below.

(*iii*) Operations which result or tend to result in volcanic activities:

(*a*) Fracturing of solid crust.

(*b*) Intermittent growth of faults and development of fault-slips.

N. B. The first two are of minor importance.

The forces which cause crustal movements and fractures, are:

(*i*) Forces which produce tidal effects on account of relative position of earth and heavenly bodies.

(*ii*) Atmospheric pressure (liable utmost to a few pounds' variation per square inch).

(*iii*) Pressure developed by expansion and contraction through radioactivity and physico-chemical reactions in the crust.

(*iv*) Gravitational pressure of the crust resting on a viscous magma.

(*v*) Subcrustal magmatic pressure which uplifts and tends to burst the crust.

N. B.—The first two are of minor importance.

The constitution and strength of the crust are of considerable importance. Seismology shows that the crust is rigid and solid to a depth of about 25 miles. It consists of about 2 miles of sedimentary rocks (porosity 30 per cent), 7.5 miles of granitic rocks (porosity 0.4 per cent) and 15.5 miles of basaltic rocks (porosity 0.2 per cent). The strength and rigidity of the rocks increase with depth. At 25 miles there is a marked "discontinuity," perhaps due to the local temparature nearing the point of fusion of the basaltic substratum. Strength and rigidity decrease with depth below 25 miles in the underlying basaltic magma which is highly viscous just below the solid rigid crust. The magmatic pressure (which tends to burst the crust) is found to be about 200,000 atmospheric pressure at the present time, being estimated* from the density, chemical composition and condition of formation of the basic substratum (a product of crystallization from the magma at about 1200°C). The temparature of the subcrustal magma is between 1200°C-1400°C.

The thickness and rigidity of the solid crust are essential for maintaining the enormous subcrustal magmatic pressure which can by no means be due to gravitational pressure of the crust floating on the viscous magma. The gravitational pressure calculated from the average density (2.8) and thickness (25 miles) of the crust can utmost be about 11,000 atmospheric pressure. It is very probable that this high magmatic pressure is developed by ceaseless atomic disintegration by which the heavier elements are being transmuted into lighter ones and the material universe is slowly moving towards *annihilation* (महाप्रलय). This causes rapid increase of volume in the interior where the heavier elements predominate. The pressure increases steadily. Periodically, at irregular intervals varying from 30 to over 100 million years (average 50 million years), the pressure attains maximum intensity when it ruptures the crust and causes epoch-making geological disturbances (खण्ड प्रलय). Recently during Tertiary Age, it has been the cause of the Alpine and the Himalayan upheavals which incidentally developed along the bases of the high mountain-ranges the well-known fractured zone (a zone of weakness in the crust) which extends from the Pacific to the Atlantic right across the Old World. The zone which passes through North Behar has converted it into a seismic area. The weakness in the crust thus created is eventually utilized by Nature as safety valves through which the ever-increasing volume of magma and the enormous heat generated by the ceaseless atomic disintegration in the interior of the earth, are from time to time released particularly at times of periodic major and minor geological disturbances. The operations are essential for the growth of the crust, maintenance of climatic condition and thus the evolutions of this planet. The lava, poured out, supplies the materials (silicates, etc.) for the building up of the crust which is perhaps still growing thicker and stronger, and the earth (which is young yet) is probably increasing in volume while the Universe is expanding. The motive forces which cause terrestrial evolutions are inherent in atoms; they are released with atomic disintegration.

Some observations of Schuchert regarding close relation between the past geological disturbances and climatic changes are of considerable scientific importance. There was a marked change in the local climate immediately before and after the recent earthquake. Whether the change in the atmospheric condition was due to the earthquake or it was the local variations in the barometric

* *Quarterly Journal of Geological, Mining and Metalurgical Society of India.* Vol. IV. No. 2. —Co-relation between Specific Gravity, Chemical Constitution and Condition of Formation of Minerals and Rocks. By D. C. Nag.

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

pressure which caused the earthquake, needs very careful investigation. It is noteworthy that extensive sub-marine and sub-aeriel mountain-making and volcanic activities produced opposite effects on climates of geologic times. Geological and bio-logical evidences show (see *Climates of Geologic Times* by Schuchert, 1914) that extensive sub-marine activities generally accompanied by marine transgression (caused by elevation of oceanic beds) are followed by prolonged tropical climate while cold climate or glacial condition (even in tropical planes) appears as if *Suddenly* introduced immediately after periods of world-wide sub-aerial mountain-making and volcanic activities. Thus the grand Himalayan upheaval was immediately followed by extreme cold climate so that glacial condition prevailed in the foot-hills of Himalaya at low levels even considerably below 5000 ft. elevation. The Pleistocene Ice Age in Europe and other Ice Ages followed periods of great moun-tain-making and volcanic activities. Numerous instances are cited by Schuchert in support of his generalization. Evidently the amount of heat brought up from the interior during mountain-making and volcanic activities and *the way* the heat is dissipated from the surface primarily control the climates of geologic times. While under the submarine condition the heat is long retained by oceanic water, under sub-aerial condition it is quickly lost by radiation ; the two conditions thus bring about hot and cold climates immediately after the disturbances. Hence could it not be that the recent local climatic change was incidently the effect of the earthquake and not its cause as suggested by some ? The earthquake might have produced disturbances in the local temperature gradient and the heat brought up was quickly lost resulting in the marked hot and cold climate. This problem certainly becomes a very difficult one considering the insignificance of the recent earth-quake and of the actual climatic changes. Quick alternations of hot and cold climate might have been due to succession of fore-shocks and after-shocks which made the problem more complex.

Many theories have been recently advanced through newspapers to account for the causation of the earthquake in North Behar. It has been ascribed to *Isostasy* (a commonly accepted theory) suggesting that the Himalaya which has become lighter by constant denudation is behaving more or less like an isolated solid body floating in the denser subcrustal magma ; in other words, the rising up of the Himalaya to re-establish isostatic equilibrium is the cause of the earthquake. It is hardly possible now to prove definitely the actual rise of the Himalaya by any satisfactory evidence. The investigations of the Indian Survey and the Geological Departments may, in course of time, be able to throw more light on the matter. Seismology shows that the crust is rigid and about 25 miles thick. Considering the density of the sedimentary, granitic and basaltic layers and hence the available space at different depths, the fractures in the crust may be expected to develop only in the upper zone. The zone of cavity possibly extends to a depth of about 4 miles and that of fracture to 8 or 10 miles ; below this the weakness in the solid crust can be expected to exist in the form of local strains in molecular aggregation. At present the crust is apparently adequately rigid and strong to resist the gravitational effect and withstand an interal explosive force caused by 200,000 atmosphere magmatic pressure. The crust should probably remain in tact even if the interior were hollow, and so it should be too rigid for isostatic adjustment at the preasent time. But it is very probable that isostatic readjustments take place at times of periodic epoch-making geological disturbances when the basic substrata are more or less fused and the overlying layers are rendered considerably plastic by the enormous accumulation of heat in the subcrustal region. The plasticity should account for the wrinkling, warping and overthrusting of strata which are otherwise very rigid. Isostatic readjustment is more likely only a periodic phenomenon and as such it can as well explain the low density of rocks beneath the high mountains, a fact (established by the well-known geodesic pendulum experiments) on which the theory of isostasy has been principally based. The formation of lighter granitic rocks in the upper zone below high mountain-ranges can also be explained by the local magmatic temperature and pressure at times of formation—the predominance of temperature effect on density.

The severity of the shock in North Behar and its extension over nearly two million square miles suggest deep-seated origin of the earthquake. The primary origin of the earthquake is very likely some deep-seated plutonic intrusions which caused fault-slips and originated secondary centres, presumably, in a series of pre-existing faults at different levels in the upper fractured zone. In the geological history such intrusions through local planes of weakness at great depth in the crust are of frequent occurrence. Some-times they develop into volcanic outbrusts. The sulphurous fumes ?) in the atmosphere of the disturbed area would suggest new fractures extending to several miles' depth where the normal temperature should be a few hundred degrees centigrade—a condition more suitable for the generation of sulphurous fumes from the decomposition of sulphides in the rocks. The numerous hot springs may similarly indicate deep fissures and local weakness in the crust. Many of the fissures are, sooner or later, liable to be choked and closed up but the weakness in the crust remains. This leads to repreated local earthquakes at irregular intervals which may be eventually followed by volcaic eruptions perhaps millions of years hence, when the local weakness in the crust and the magmatic pressure below become considerably more. Volcanic

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

eruptions may at some distant future convert the afflicted area of North Behar into a highly mineralized zone traversed by many metalliferous veins and dykes which are now absent; precious metals are, as a rule, of eruptive origin.

Joly has very ably shown the importance of radioactivity in geological history, particularly its thermal aspect. He found that high temperature gradient goes with high radioactivity and low temperature gradient with low radioactivity of the country rocks. Temperature gradient mainly depends on local atmospheric condition, physico-chemical constitution of country rocks and the intensity of subcrustal magmatic heat. The average temperature gradient is about 1° rise per 100 feet depth. There are fair amounts of radioactive concentrations in the rocks near the surface. All rocks are now considered to be more or less radioactive. According to Joly the radio-thermal source of heat in the crust can produce local fusion and minor geological disturbances. Besides the thermal aspect, the volumatric changes resulting from the radioactive or atomic disintegration produce considerable effect. Thus radioactive concentration in a rock, through its tendency to increase more rapidly in volume, would produce considerable strain in the rock which would burst if situated near a fractured zone; want of sufficient available space or adjacent fracture would induce the formation of high pressure minerals such as garnet which is thus very abundant in the deep-seated Eclogite. The rock-bursting due to radioactive concentration may cause fracturing and fault-slips and thus earthquakes. The frequent disastrous rock-bursting phenomena in the deep Mysore gold-mines may be due to radioactivity but confirmative investigations are needed; the pegmatitic character of the gold quarts is congenial to radioactive concentration.

It may be noted that there is marked concentration of radioactive minerals and hot-springs along a zone running northwords from Ranchi through Hazaribagh and Gaya to Rajgir. The radioactivity of some of the hot-springs of Rajgir and Topoban and some of the local minerals (*e.g.* allanite from Bahia, Pitchblende from Singar, columbite, etc.) have been demonstrated by research works carried out in the Bose Research Institute, Calcutta. Unfortunately there is no definite knowledge about the radioactive concentration in the northern extension of the zone. Evidently Patna, Mozufferpur, Darbhanga, Sitamari, Motihari and Khatmundu lie on the northern extension. Monghyr, Jamalpur, Bhagalpur, Purnia, and Darjeeling are situated considerably to the east. All the above places were severely disturbed. The disposition of the severely disturbed areas suggests that there might be three principal faults, one running north to south through Mozufferpur, another running north-east to south-west through Monghyr and Gaya and the third running east to west along the foot of the Himalayas. These faults with a series of minor faults would [illegible] more or less isolated areas creating very suit[able] condition for fault-slips and local earthqua[kes]. Hot-springs are generally found along fault [lines] and so their relative positions may throw cons[ider]able light on the location of the faults. It may [be] worth-while alsoto investigate the radioactivity [and] local temperature gradient wherever practic[able]. The leakage of gold-leaf emanation electros[cope] like the one locally constructed and [used] in the Bose Research Institute, may be tried [for] the determination of local radioactivity.

Seismologists find that the centres of se[vere] earthquakes are very often about 25 miles be[low] the epicentres and thus probably are at or n[ear] the junction of the viscous magma and the s[olid] crust. Similar finding in the case of the N[orth] Behar earthquake would strongly support t[he] suggested view of the deep-seated plut[onic] intrusion as the primary cause of the earthqua[ke]. The centres of the after-shocks which are genera[lly] not so severe and extensive are likely to be fou[nd] in the upper factured zone within a few miles fr[om] the surface. The after-shocks may be ascribed [to] fault-slips and local fracturing caused by gravi[ta]tional force and local radioactivity: they are [of] secondary origin. De Montessus (1906) fou[nd] that about 95 per cent of the severe earthquak[es] have their origin along the recognized zones [of] weakness in the earth's crust. The shocks [are] repeated in the same locality at irregular inter[vals] and there is hardly any basis on which they [can] be foretold. Seismology may be expected to [do] wonders. Better organization, improved seism[o]graphic instruments and more careful study [of] fore-shocks may, at no distant future, lead [to] satisfactory prediction which will be a great bo[on] to humanity. Seismology has already given [the] most definite information about the interi[or] constitution of the earth.

The destructive effects of earthquake on buildin[gs] and the loss of life and property involved have [set] afoot important engineering problems. The failu[re] of buildings to withstand the shocks appear to [be] largely due to failure of the mortar used [to] withstand the jerks and the deviations of [the] structures from the plumb-line caused [by] oscillatory movements. This leads to horizon[tal] cracks and toppling down of the upper portio[ns] of the buildings. Perhaps greater damages are [as] often done by the shifting of sands fr[om] underneath the foundation developing unev[en] settlement of foundation, vertical fractures [and] collapse of buildings. The shifting of sands fr[om] the subsoil and their accumulation at the surf[ace] have rendered many rich agricultural lands in Nor[th] Behar into sandy barren tracts. Injection [of] water through fissures and the forcing [of] water-currents through subsoil greatly facilitate[s] the shifting of sands and their transportat[ion] to the surface. The soil has become loose an[d] must be allowed to settle before new buildi[ng] constructions can be safely undertaken.

In 1897, a severe shock was felt at Wari in ...ence. It was hardly possible to keep standing ...d the local buildings and compound walls were ...en oscillating making five to ten degrees angles ...h the vertical. The shock lasted for a few ...inutes. No serious damage was done to any of ... structures at Wari in spite of their being ...ade of brick masonry with mud mortar. On the ...her hand, many of the more substantially ...ilt buildings were either totally demolished ...r badly damaged in the southern portion of the ...wn situated on the bank of the Buri Ganga. ...e reason for such marked difference in ...e destructive feature in adjacent areas ...ay be ascribed to the difference in the ...il, that of Wari being red ferruginous ...ay while at the southern part of tne ...wn adjacent to the river it is sandy. ...e same reason probably accounts for the ...llapse of many buildings in Patna, Monghyr and other places situated along the banks of rivers. Evidently masonry buildings are very unsafe on sandy soil in a seismic area. A very thick bed of alluvium, as in Calcutta, has damping effect to earthquake shocks. Small thickness of alluvium is very dangerous as in the case of Monghyr. Structures on rock foundation should be quite safe against tremor if substantially made. For the construction of important masonry structures in a seismic area construction engineers should give special attention, while disigning, to foundation, reinforcement by steel and the quality of mortar. In case of sandy soil, if unavoidable, the concrete foundation should be considerably spread out, and pile driving may be necessary. Steel structure and reinforced concrete works are likely to be found safer for the superstructure.

EARTHQUAKE—ITS SCIENCE AND SUPERSTITIONS

By G. C. MUKHERJEE, M.Sc.

Introduction

"LIVING creatures, particularly men, may be compared to colonies of ants clinging for dear life to tiny fragments of a wrecked ship in a tumultuous sea and men have somehow been persuaded to the belief that they can hold out only by practising cannibalism on a large scale." In these words Prof. Saha described the precariousness of human existence in this Universe, in his presidential address to the twenty-first session of the Science Congress held at Bombay on January 3, 1934. Just twelve days later occurred the terrible earthquake in the northern Bihar attended with the most severe loss of life and property within living memory.

The fateful day of the 15th of January was a usual winter day cool and bright. The minor Hindu holiday that fell on that day, did not much disturb the daily routine of the majority of the people. At 2 o'clock, peasants were in their fields, shopkeepers were in the market, clerks were in their offices, everybody being busily engaged in his daily routine of life. Thousands of hands were working in the newly-built sugar factories, which were pulsating with full life, it being the height of their season. Only the womenfolk in urban areas were at home, engaged as usual in their domestic duties. In a word, there was not the faintest premonition of the impending calamity in the minds of the teeming population of North Bihar. At about 2-15 P.M. came the terrible earthquake with the suddenness of a lightning, and within a few seconds its work of destruction was complete. Before the people could fully realize what was happening and in some cases even before the awe-stricken women of the house could rush out of their crumbling houses, towns were razed to the grounds burying thousands of men, women and cattle under the debris, the majority of victims being women and children. Death cries and shrieks and groans of the wounded people on all sides filled the air. The catastrophe was no respecter of persons.

> "Sceptre and Crown
> Did tumble down,
> And in the grave was equal made
> With the poor crooked scythe and spade."

The gorgeous palaces of big magnates like the Maharajah of Darbhanga took no more time in kissing the ground than the huts of peasants. North Bihar had recently become a great centre of industrial activity owing to the sugar boom. Powerfully built factories of iron and concrete were hurled down as if struck by a Titan's hand, burying or crushing to death hundreds of workmen. The railway bridges made of steel girders and solid masonry designed to support the heaviest loads were broken and twisted like any structure of straw. The ground was rent at numerous places by fissures of various sizes, and moist sand, slime and water were belched out of the bowels of the mother Earth. In the whole of the northern Bihar, hardly a building escaped serious damage, and no considerable area could be found which did not bear on its face some mark of the sudden catastrophe.

The number of lives lost is not yet definitely known as dead bodies are being still recovered from under the debris but the total may go well over 15,000. The towns of Katmandu, Motihari, Muzaffarpur, Darbhanga and Monghyr have suffered most, though Patna, Gaya and other neighbouring towns too have been severely damaged. The shocks were practically felt all over the northern India and even as far south as Bombay and Madras.

Impressions Left by an Earthquake

Events like this cannot but create a lasting impression on the human mind, both in space as well as in time. Newspapers, during the last month and a half, have been full of the news regarding the details of the disaster, and sympathetic appeals for relief. And human nature was aroused on its better side, for the alleviation of the sufferings of the stricken people. This is as it ought to be. But at the same time along with the catastrophe a mist of superstitions seems to have flooded the country. Fortune-tellers have rushed to print, claiming that the disaster was predicted by them months ahead from the combinations of planets. Pseudo-scientists apparently educated and holding responsible positions are filling the papers with novel theories which are curious mixtures of mysticism and ill-digested modern scientific knowledge. After the disaster, when people are dazed and their minds are terribly shaken the stories of *pralaya* (world-cataclysm) almost daily predicted by astrologers are finding easy credence.

A large number of religious theories are afloat probably trying to justify the conduct of God Almighty to mankind, the latest being that the earthquake has been sent as a punishment for the perpetuation of untouchability in this country. But this theory does not explain why the calamity has not spared the Muhammadans

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

and Christians who do not believe in or favour untouchability or why South India, where untouchability is found in its most objectionable form, has escaped with a light shake. Had not the incident been so pathetic, a study of the current beliefs about the recent earthquake would have thrown interesting sidelight on the depths of silly credulousness to which the human mind can sink. The latest story current in Bihar attributes the earthquake to the Houston expedition which had recently flown over the Mount of Everest, reputed to be the abode of God Siva who had signified his displeasure by giving the earth a mighty shake.

This theory again fails to explain why the visitation should be upon the innocent residents of North Bihar, while the perpetrators of the shocked crime are perfectly hale and hearty and enjoying the reputation of their adventure in England.

Such wild stories are by no means confined to our own country alone, numerous such examples are found even in the Western countries. After the terrible Lisbon earthquake of 1755, which destroyed the whole city of Lisbon and swept 50,000 of the population into the depths of the sea within two minutes, the clergymen of Protestant Europe held that the disaster happened to Portugal because it persisted in remaining a Catholic country; while the Portuguese clergy who are Roman Catholics thought that God Almighty had inflicted the punishment on them because they had tolerated a few heretical protestants in their midst. As a precaution against future visitations of such divine wrath some of these protestants were forcibly converted and others killed or expelled. His Holiness the Pope tried to console the people by issuing a Bull in which the hackneyed theory was again reiterated that whatever God pleases to do is for the ultimate good of mankind. When Voltaire heard of this amazing theory, he remarked, "I am confirmed in my opinion that the priesthood arose when the first hypocrite met the first fool." The same thing can be said of the art of divination. It arose when the first hypocrite met the first credulous fool, and we have too many of both classes in our country.

Speculations Regarding Cause of Earthquakes

A catastrophic earthquake is such a terrible event that speculations regarding its origin have been active at all times, among all classes of people, the savage as well as the civilized. It would require a big volume to discuss or even to enumerate all these speculations, though such studies would prove to be of considerable interest to a student of social anthropology. We cannot, however, here resist the temptation of mentioning the amusing belief prevalent among the Garos of Assam, which was brought to light by Mr. R. D. Oldham after the great Assam earthquake of 1897. They believe that the earth is a square surface, suspended in space by four strings tied to its four corners, much like the pan of a balance. Some mice are continually trying to cut off these strings. To a blind demon has been assigned the task of keeping away the mice. As the demon is blind, the mice sometimes succeed in cutting a string or badly damaging it. The Garos thought that the great Assam earthquake was caused by the fact that the protecting demon so far forgot his duty that the string was allowed to be snapped into two and the pan standing for the earth was turned upside down. Under this belief, some of them rushed under a raised platform so that even though the earth was inverted, they might still have a solid floor to stand upon. Not far removed from this Garo belief is the popular Hindu belief that the earth is supported on one of the heads of a thousand-headed snake, and the earthquakes are caused when the snake-god transfers its burden from one hood to another. Even in the misty periods of medieval times, however, men with a rational bend of mind found it difficult to put any credence on these fanciful tales. Bhaskaracharya ridiculed the whole idea as follows. Said the old Pandit, "If it is found necessary to postulate a snake for supporting the earth, it is equally necessary to postulate another support for the snake. Let it be an elephant for which again a third support will be needed. Proceeding in this way we shall have to postulate an infinite chain of such supports and the supported, and still the original difficulty would remain. So, it is better to accept that the earth moves in space by itself."

In ancient Greece as well people believed that there was an Earthquake god and during an earthquake they tried to propitiate this god by offering prayers and sacrifices. Many savage people cry "We are here, we are here," when they feel the earth tremble beneath their feet. This is probably due to a belief that the God has fallen into a slumber, and has forgotten to care for the people assigned to his care.

Science of Earthquake

The phenomenon of earthquake did not receive much scientific attention in any country until very recently. Scientific study of earthquakes (or seismology, as it is called) really began only about 70 years ago, after the great Neapolitan earthquake of 1857, which shook the whole of Italy and took a toll of about 12,000 lives. An Irish engineer, named Robert Mallet, secured a grant from the Royal Society of London to proceed to the scene of disaster and to make a scientific survey of the catastrope on the spot. After a thorough and searching investigation he published his report in which the foundation of the modern science of seismology was laid. Since Mallet's time, seismology has been vastly developed specially by the scientists of Japan

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

and Italy, as of all the civilized countries, these two happen to be visited by the most frequent and destructive earthquakes. What the modern scientific investigations have revealed regarding the nature and origin of earthquake shocks, we shall see just now. But before that let us see how the earthquakes are caused.

There is a very widespread belief, specially among the educated people, that an earthquake is due to volcano either active, dormant or extinct. The recent disaster gave rise to a belief that North Bihar is developing into a volcanic region. All these ideas are absolutely fanciful and are without any scientific basis. As a matter of fact it is common knowledge that though the eruptions of volcanoes are generally accompanied by earth tremors, these are rarely felt over a large area (seldom exceeding 100 or 200 sq. miles). The seat of the disturbance too lies very near the surface. Most of the great earthquakes of the world, even when they occur in volcanic countries, have not much to do with volcanoes, but are, what is scientifically called *tectonic*, that is, due to defects in the formation of the earth's crust. A little digression here about the structure and history of the earth's crust will help us greatly in better understanding these phenomena.

The Formation of the Earth

We know from astronomical studies that originally our planet must have been a great swirling mass of gaseous matter in a state of white heat. For millions and millions of years it went on cooling till a solid crust began to form on the surface. The phenomenon is very much like the formation of cream over the cooling surface of hot milk. Those who have had the opportunity of observing the operations of a factory smelting iron, will understand the process better. When the surface of the molten iron cools, a crust forms on the surface. This is known as the slag and consists of sandy matter which is held in solution as long as the iron is hot, but is given out when the liquid iron cools. We may suppose that the formation of the earth was similar. The centre of the earth is full of nickel-mixed iron most probably liquid, called by the scientists the fluid magma over which has formed a thick crust of rocky matter called the lithosphere (from lithos-stone).

In those early days probably the whole of the water that the earth contained was in the atmosphere in the form of steam. But gradually as the crust cooled the water was precipitated on the surface and formed the oceans that we now see. In course of the cooling the earth also shrank considerably in size and the rocky crust over it underwent folding and crumpling at numerous places like the skin of a dried up apple. The comparatively elevated portions remained outside water and formed continents, while the wrinkles on the crust formed formidable mountain-chains of old days. During these times the surface of the earth must have been extremely monotonous and uninteresting, all the continents and mountains were made up of barren rocks and the rest was water. There was no variety in these rocks, there were no soil-bearing plants or animal life, not even a desert.

But there must have been plenty of rain giving rise to vast rivers, and a much vaster atmosphere giving rise to violent winds. It is due to this dual agency of river and wind that the monotony of that early scenery was broken. The rocks were decomposed into soil and became suitable for plant and animal life. The development of life on the earth continued through hundreds of millions of years, and four stages are distinguished by the geologists: (*i*) the Azoic (no life) (*ii*) Palaeozoic (early life) (*iii*) Mesozoic (middle life), (*iv*) Cainozoic (recent life), (*v*) Post-tertiary.

Geologists make certain sub-divisions in the cainozoic period. First comes the Eocene (meaning dawn of recent life when the climate was very warm), then the *Oligocene* (little of recent life), then comes the Miocene (some recent species) which was the great age of mountain building and when the temperature was falling. Then comes the Pliocene (more living than extinct species) and the Pleistocene (majority of living species) during which the World became mostly covered with ice. When the wind is charged with dust and sand their eroding power is very great and during the history of the earth many a desert has been formed in this manner. The great desert of Sahara was formerly a hilly region but much of it has been levelled down by the unrelenting action of powerful winds laden with sand. Rivers as well as glaciers decompose the rocks over which they flow much more powerfully than winds. The alluvial soil which is such a common feature of the earth's topography today, and which alone has made agriculture possible, is entirely due to the action of running water throughout the ages. Not only the soil which we find today in river basins and river deltas, but also the materials out of which the greatest mountain ranges of the present age have been formed consist of sediments brought down by the vast rivers of past geological epochs. The enormous amount of material that one river collects and brings down is really amazing.

Due to the existence of wind and river continents by this time would have been levelled down to vast plains but for the fact that new mountains are being periodically formed. The world has already passed through several such cycles of mountain-breaking and mountain-making. Prof. Joly describes the process as follows:

"At long intervals the continents sink relatively to the oceans, the water stealing in on the lands. Great inland seas are so formed and persist for ages. During this time the low lands of the continents continually shed

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

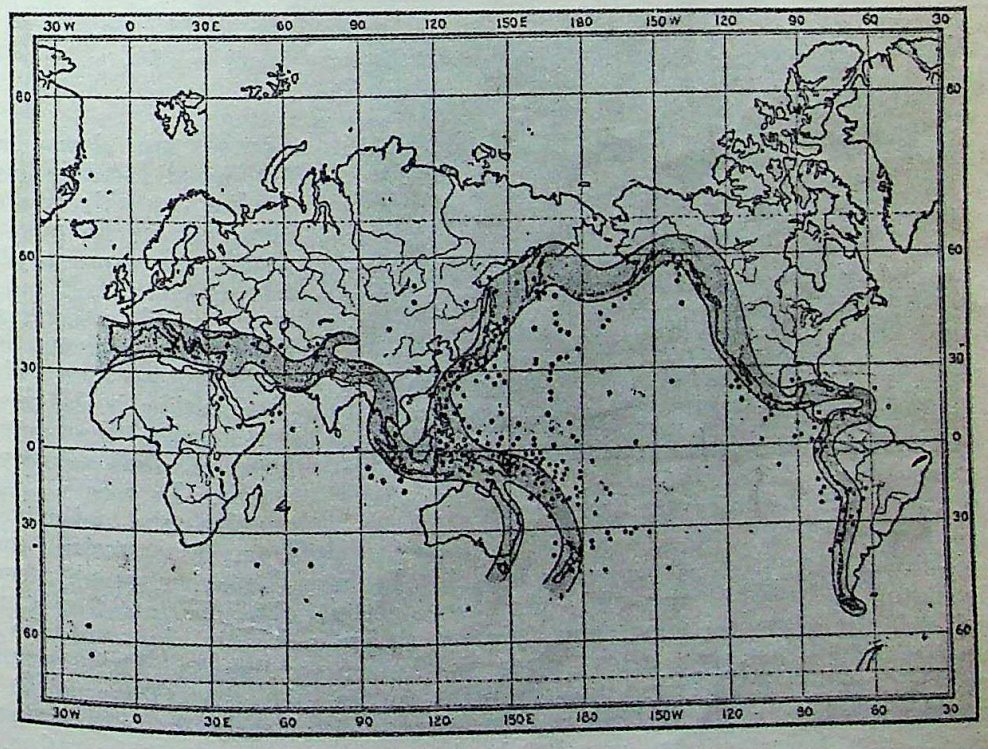
Digitized by Arya Samaj Foundation Chennai and eGangotri

of their denudation into the inland
so that great depths of sediment are
mulated, then slowly all is reversed. The
ntinents rise relatively to the oceans. The conti-
al seas disappear and gradually great compres-
forces acting laterally upon the continents fold
crush the sediments which had collected in
former continental waters. In this way
ntains arise where formerly had existed for
the expanse of the invading seas."

We are living at a time when such a mountain-
lding period has just closed. The latest mountain
ins so formed are the Himalayas and the
s in Eurasia and the Rockies and the Andes
the western hemisphere. Where the Himalayas
d today was, millions of years ago, a great
al sea,—the Tethys sea of geologists, was
nected with the Mediterranean sea and formed
central ocean which divided the continents of
northern hemisphere from the continents
the southern hemisphere. Southern India was
then not a peninsula as it is now, but was
nected with Madagascar and Africa and
med a vast land mass known as the
wanaland. The rising of the Himalayas
d the separation of India from Africa are not
very ancient, they probab-
took place after the
mmals had already
ppeared on the earth
the Oligocene age).
The close connection
between mountain forma-
ion and tectonic earth-
uakes will soon be
pparent. It cannot be
xpected that the great
ges of past ages which
olded and crumpled up
the solimentations of the
ean beds into huge
ountain chains of by-
one days have ceased
ow or left the rocky
rust in tact. In fact,
hese upheavals cause
umerous fractures or
faults in the earth's outer
rust and the huge rock
alls. Such faults are
miliar enough to miners
nd geologists and show
hat the rock strata have
een actually dragged
part or thrust together until they have
broken through. Due to the continuous influence
of the great compressional or tensional forces
which are always active in the lithosphere (the
outermost portion of the rock strata along these faults
segments of the rock strata along these faults
often take place. Such movements are generally
slowly and gradual but sometimes there are
sudden slips causing some underground cataclysms
like that crushing of rocky veins, or the opening
of fissures. When such an event takes place, the whole crust of the earth above it is agitated in the form of mighty waves, just as water is thrown into waves when a stone is dropped into it. These waves compress and distort the rocks and alluvia lying above, causing havoc according to the magnitude of the disturbance and distance of the locality from the place of disturbance.

Earthquake Regions of the Globe

From the above considerations it is natural to expect that most earthquakes are expected to occur in those regions where mountains have only recently come into existence. Because the cracks and fractures in older mountain ranges like the Vindhyas or the Aravalli Hills, or the Ghats in South India have done all they could do in the past and have now come to some sort of stable equilibrium, very few earthquakes have their origin in such old land masses. This is exactly what has been observed. About 95 per cent of all the earthquakes occur in the two great recently formed mountain chains surrounding the globe. One is the Alps-Caucasus Himalaya circle, and the other is the Andes-Rocky Japan-Malaya circle. This fact is a striking confirmation



Map of the World showing earthquake distribution

of the recent earthquake theories. Besides this, the evidence of underground dislocation of rocks during a great earthquake can often be seen on the surface in the form of long cracks (not the smaller fissures which are due to shaking) miles long. Sometimes the ground on one side of such a crack sinks down or is raised up by several feet, proving thereby that the bedrock has subsided or has been thrust up due to tremendous pressure from sides. Such a crack about twelve miles long,

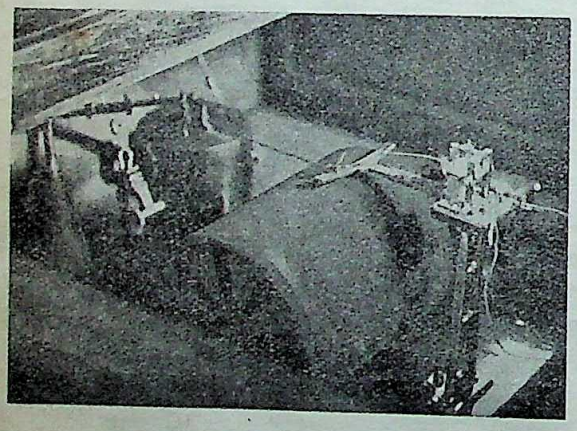
CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

was visible after the Assam earthquake of 1897. After the great Californian earthquake of 1906 which destroyed the city of Sanfrancisco the fault could be traced for 200 miles. The main cause of the majority of the earthquakes is some fault or fracture in the earth's crust, but a few others are suspected to be contributory causes, such as variations in atmospheric pressure, unusual difference in rainfall in mountains and plains or disturbance due to a distant earthquake though these theories have not yet been satisfactorily proved. These factors may be decisive when some fault is already at a critical stage. A great earthquake near Greenland last November and the coming of the cold wave (with accompanying disturbance of the atmospheric pressure) from the Panjab to Bengal between the 11th and 14th of January, have been suggested as the immediate causes of the Bihar earthquake at intervals of one week. Another big shock has been recorded somewhere in East Indies on February 15.

Instruments for study of Earthquakes

The instruments which are used in recording and studying earthquake motions are known as



Photograph of a Seismograph

seismographs. The type generally used in India is shown in the picture. The place inside the earth's crust where the disturbance giving rise to an earthquake actually takes place is known as the *focus or the centre* and the point on the earth's surface vertically above the focus is called the *epicentre*. As mentioned above the disturbance at the focus compresses the rocks and also gives them a twisting motion and these two types of waves spread out throughout the volume of the earth until they emerge on the surface. They are technically known as the longitudinal, or P-waves and torsional or S-waves. P denotes primary, S denotes secondary. But the disturbance reaching the epicentre gives rise to a third class of waves which throw the surface of the earth into violent undulations. They are known as the surface waves. They are the slowest but most destructive but they quickly get weaker and weaker on spre... farther and farther from the epicentre. ... this has been clearly illustrated in the a... panying diagram. Of the three types, the pr... or the P-waves travel with a velocity of ... six miles per second. The secondary or

Seismograph Record

Distances from other seismographic stations are similarly calculated: Kodaikanal 1400 miles, Agra 150 miles, Kew (London) 4600 miles. From these distances, Dr. Roy calculated the centre of disturbances to be roughly located at longitude 86° 15′ East, and at the parallel of latitude 26° 15′ North, which is a point a little to the east of Sitamari just on the Nepal border. This location agrees with the findings of the local report, for the region round Sitamari suffered most. But probably the disturbance took place over a large area as in the earthquake of 1897.

The actual position of the epicentre can also be known from one station from the direction in which the ground moves, and the distance of the epicentre. A more reliable method is to compare the reports of three or more different observations. But the best method of finding the position of the epicentral tract is by actual geological survey which has now been undertaken by the officers of the Indian Geological Survey in Northern Bihar.

No satisfactory method has yet been discovered for finding accurately the depth of the focus below the surface, though several approximate methods are in use. It has however been estimated that generally the focus may not be far from the surface up to a depth of 30 miles. Generally the Italian earthquakes have been very near the surface but the Indian earthquakes are distinguished by possessing very deep foci, sometimes reaching a depth of 450 miles.

Delicate seismographs have added immensely to our knowledge of the earthquake phenomena. We now know that about 30,000 shocks occur annually of which only a fraction is felt. So that the astrologer is quite safe in his predictions, for an earthquake takes place in every third year. But the number of big earthquakes is small and though we do not usually feel the shock for more than three or four minutes, yet the tremor really lasts for a much longer time and dies down only gradually. After a great disturbance, a series of milder shocks of varying intensities may continue for months or even years, because small adjustments of the earth's crust continue to take place and some time is needed to attain a stable equilibrium. This has also been the experience in Bihar. These after-shocks are rarely dangerous. In India seismographs have been installed at Calcutta, Bombay, Agra, Kodaikanal and Dehra Dun and are keeping records of earthquakes. But India as a whole has no seismological laboratory on the scale Japan or Italy has organized. In fact, these two countries suffer from more disastrous types of earthquakes than India. Here is a list of some terrible earthquakes which have visited these countries. A great Japanese earthquake in 1703 is said to have taken a toll of 200,000 lives. One in 1880 remined the city of Yokohama and led to the immediate establishment of the Japanese Seismological Society. The Mino-Owari disaster of 1891 cost about 10,000 lives. Still fresh in our memory is the terrible earthquake of 1923 in which about 100,000 were killed. Besides these, Japan has been visited by severe earthquakes in 1830, 1847 and 1896. Like Japan, Italy too has been the victim of many destructive earthquakes from time immemorial. Among those which occurred in recent years are the Calabrian earthquake of 1783 in which six violent shocks were felt within a period of a month and a half; the Neapolitan earthquake of 1857 which has already been mentioned, and the terrible Messina disaster of 1908 which destroyed about a hundred thousand lives within two minutes is an event of still recent date.

'How Can We Protect Ourselves From Earthquakes?

This is a question which is being now asked by everybody. It is, of course, possible in two ways, either if a forecast of the occurrence can be correctly made or if the destructiveness of an earthquake can be minimized. Can anybody

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

predict earthquakes? The astrologers have a ready answer. If something is paid them, the self-constituted agents of planetary gods, they would intercede with the gods on behalf of mankind. But the scientists' tale regarding this enquiry must sound like Cassandra's prophecies. As we have seen, the earthquakes are caused by internal movements in the earth's crust, and the sun, the moon or the planets have nothing to do with them. The forces which give rise to the quakes will remain present till probably mankind passes away from this globe, as so many other forms of lives have disappeared within geological periods. So earthquakes will come and cause devastation and it will never be possible to prevent them. The only service which science may render is their prediction in advance.

Even now the astrological almanacs, which exert so much influence on the minds of the superstitious public, contain an annual list of predictions. They predict numerous things in safely vague terms, and lucky coincidence is mightily boomed while the failures are forgotten. This article is not meant for those who would prefer to consult these encyclopaedias of superstition for earthquake prediction. The absurd methods and ridiculous beliefs of the almanac-makers are, however, far below being honoured with scientific criticism.

Scientists unlike astrologers or almanac-makers are keenly conscious of their limitations. They have to confess that in spite of their best efforts the prediction of earthquakes has not yet been achieved. But there are hopeful lines along which progress is being made. As the danger mainly lies along the existing faults, a great part of the problem would be solved if all the major faults could be completely located. When they are visible on the surface they can be mapped out by geological survey but as they are usually hidden underground far below the soil a simple survey is not of much use.

Nowadays, extensive surveys of these faults are being carried out with the aid of the gravity-variometer, a very sensitive apparatus invented by Baron von Eotvos of Hungary, which enables us to find out extremely small variations in the value of gravity in different directions. If the gravity is found to increase in a certain direction, it is presumed that below the soil, there are heavy rocks; if it decreases, the conclusion is that alluvia extends over great depths, or there is some underground cavity. In this way, the Japanese have been surveying their island, and have found that their country is situated along the length of a very dangerous fault parallel to the sea-coast whose movements give rise to destructive earthquakes.

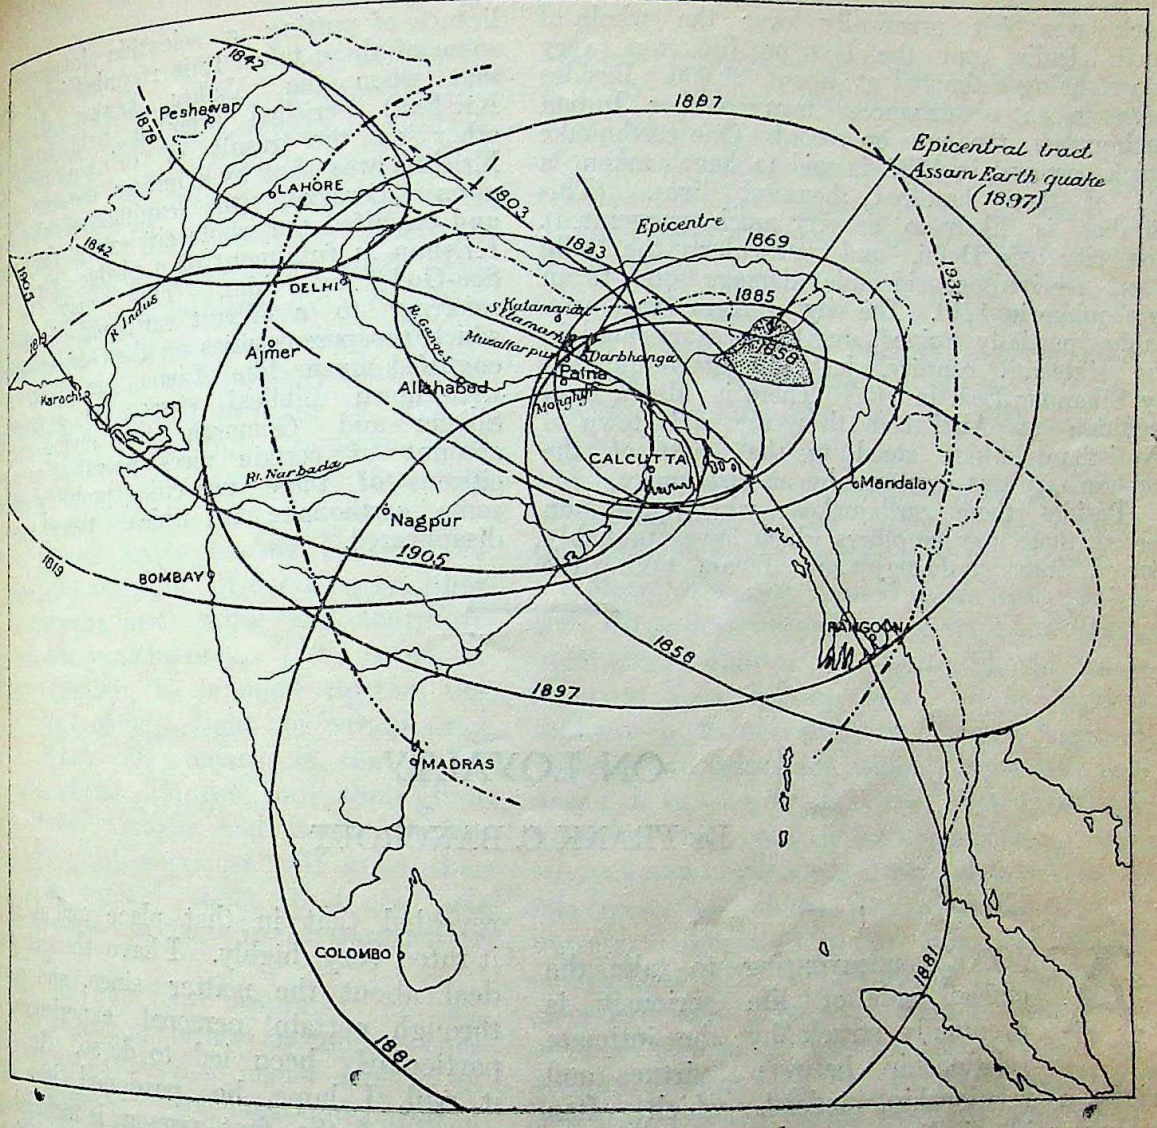
Another method of locating dangerous faults depends on the fact that, before a great catastrophe takes place much smaller movements frequently occur all along the fault. These minor disturbances can be accurately detected by delicate seismographs, and from a study of these seismograph records, the position and the extent of the fault in question can be quite definitely ascertained. Unfortunately however, the mere location of the faults solves only the problem of 'where,' but the problem of 'when' defies the scientific effort. Many attempts have been made to find some periodicity in the occurrence of earthquakes, and several periods of various lengths have been discovered. These, however, do not hold good for destructive earthquakes and are, therefore, of little general interest. It has been said that in the northern hemisphere, big earthquakes tend to occur more frequently after intervals of 11, 22, 33 and 66 years. The phases of the moon which loom large in astrology and in the imaginations of the superstitious people, like the full moon or the new moon, or the conjunctions of planets have not been found to have any connection with earthquakes.

It has been suggested that just before a shock along some interval crack takes place, some slight of distortions might be observed on the surface with the help of some vertical pillars planted in the ground.

Any earthquake, however severe it may be, is rarely directly responsible for any loss of life. All the deaths are generally due to collapse of heavy buildings made of brick or stone, as are now common in all modern towns. Therefore, the practical method to lessen the destructiveness of an earthquake is to choose proper sites and to design buildings in such a way that they may resist the strongest shocks. These questions of site and design should be specially borne in mind by the house-builders and engineers of the northern India which has repeatedly been the victim of earthquake disasters. In Japan the engineering colleges include a special course on these problems. It has been found from experience that buildings built over soft soil are more damaged than those built on hard rock. So, therefore, in choosing a site, soft ground is to be avoided as far as possible. Grounds with unsupported sides, like the edge of a hill or bank of a river, should also be avoided. As regards design it has been seen in Japan that after the severe earthquake of 1923, both *wooden houses* and the *buildings of reinforced concrete* stood the shock well, while the ordinary brick buildings were completely destroyed. But in the fires which followed, the wooden houses were rapidly burnt up. It may, therefore, be said that the buildings of reinforced concrete are the most construction in an earthquake zone, the wooden houses are the next best. The famous seismologist Prof. Milne sums up his views in these words: "Having obtained our site, we can follow one of the two general systems of construction either to give so much rigidity to a structure that it may be likened to a steel box or to erect a building which is light but which has so much flexibility

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri



Map of India

that it may be compared to a wicker basket." In either of these structures we ought to have lightness specially in their upper parts. Even in a brick house, much can be done to improve its shock standing capacity by making the roof light by avoiding projecting balconies and by making walls thicker at the bottom and tapering at the top. One portion of the building should not be too heavy while another portion is very light and arches are to be avoided as far as possible.

The recent earthquake in Bihar, however unexpected it might have been to the general public, did not come as a surprise to the geologists. Northern India being a recent geological formation has been quite frequently visited by disastrous earth shocks while Southern India being the remnant of the old Gondwanaland has been practically undisturbed. The geologists know from past experience that the earth's crust under the Himalayas is still in tension and severe earthquakes may take place any day along this region. The map of India which is reproduced here has been redrawn from the memoirs of the Geological Survey of India by R. D. Oldham. It shows the big earthquakes which have visited India since 1800. The black lines represent the areas over which the shock was felt. Particular attention may be drawn to the earthquake of 1819 in which land bordering the Rann of Cutch on the West, having an area of 2000 sq. miles, was submerged. It contained a medieval fort called *Sindri* held by some Rajput Chiefs. Even now, at low water, the top of the Sindri Fort is sometimes visible. The great Assam earthquake of 1897 was one of the most severe, but as the epicentre, shown as a black triangular area, was in a *jungly* region the loss of life was not so severe though the town of Shillong was completely destroyed and many towns in East Bengal were severely damaged. Even at Calcutta many buildings collapsed. The next great earthquake in India was in 1905 with its principal epicentre near Simla in the Kangra valley. The

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

shock was felt practically over the whole of North India and the loss of life was very heavy, being estimated at about 20,000. Besides these recent disturbances, many earlier Indian earthquakes too are on record. One earthquake which occurred in 1737 is said to have taken a toll of three hundred thousand lives. (This number is likely to be very much exaggerated). The city of Delhi, and particularly the Delhi Fort, received considerable damage due to an earthquake in 1719. The city of Agra was probably partially ruined due to the same cause in the sixteenth century, just after its foundation by Sikandar Lodi in 1490. There is also a local tradition at Allahabad that the old town of Pratisthan which stood to the east of the modern city was destroyed by an earthquake.

Besides these earthquakes which are on record, there may be others which have probably passed into mythology and I am taking the licence of putting a scientific interpretation some of these tales. It is recorded in the Pura that when the Yadav heroes (kinsmen Krishna) perished after a fight amongst other as the result of drinking carnival, Krishna was shot by a hunter, the sea encroa upon Dwarka, the capital of the Yad and engulfed the whole city except the palace Krishna in fulfilment of a pledge given to Sea-God by him. This may be d referring to a distant earthquake in the pas which prosperous cities on the Guzerat coast engulfed much like Lisbon in 1755. Ano well-known Biblical story, the destruction Sodom and Gomorah by divine angels account of certain vices prevalent amongst citizens of these two cities, probably referred some earthquake in which these two ci disappeared.

ON LOYALTY

By FRANK C. BANCROFT

I

ANYONE endeavouring to take the ethical side of life seriously is eventually struck by the intimate relationship between virtues and vices, a relationship, indeed, which often makes an identical act seem praiseworthy and reprehensible to two persons of equally good character. Perhaps no complex of human attitudes more eloquently illustrates the point than those which cluster about the word "loyalty." Generally reckoned to be a good thing, not a little can be said to prove that it is far from being the royal road to everything desirable in life. What follows is an effort to assay it, as far as possible judiciously, bearing upon both its advantages and disadvantages.

Some years ago, in connection with a news competition in Princeton University, I approached ten leading academic personalities, ranging from the president to the janitor, asking what, in their opinions, were the six most important words in the English language. Prepared independently, six of the lists gave "loyalty" the leading position, which at least revealed that in that place and at that ti it rated very highly. I have thought a go deal about the matter since, and recent through certain personal experiences, ha particularly been led to do so. According it will, I hope, be pardoned, if a certa amount of the first person is included in t analysis, for in such matters we are influenc by nothing so much as the actual choic which we ourselves are called upon to make.

There are various agencies to which man's loyalty is from time to time solicited spontaneously offered and it is largely up the basis of his reactions in these connecti that he is considered loyal or the revers like all the other virtues (if such it be) loyal can be truly known only in action, or at le in attitude. No one is abstractly either lo or disloyal. Let us begin then with the sta which is one of the largest agencies to wh the individual is connected and, incidental the one in relation to which loyalty is m commonly discussed. Should a man at s times be loyal to his country; and, if s what does such loyalty involve? Recen I had a conversation with a member of

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

country's diplomatic service in which he inferred that certain actions of mine jeopardized American business interests in another country and were hence disloyal. I could think of no answer but that my actions seemed right and that business interests, whether American or otherwise, would have to arrange themselves accordingly. Not long ago thousands of English university students in many institutions stated publicly that under no circumstances would they go to war to fight for their king and country. And recently, several years back, a noted Canadian internationalist and divine was refused citizenship in the United States because he reserved in his conscience the right of deciding whether future wars were just wars, and therefore worthy of his participation. The acme of loyalty to country is summed up in the phrase: "My country, right or wrong—my country." What this means is that in a certain area of his life the individual gives up both critical thought and moral choice, and surrenders his innermost self to another agency. Many would claim that at just this point he ceases to be either a rational or a moral being.

Leaving till later any appraisal of this situation, let us look at loyalty in another very close connection, that of a man's fidelity to his creed. Most of us are born and baptized (by one rite or another) into one of the five great classical world religions. Does loyalty demand that we should live and die by this creed and do our best to start our children in the same direction? It so happens that I am a *padre* in the Anglican Church, born in America as the Episcopal Church. I took this step because I genuinely believed that in so doing I could use my life to the best advantage, both personally and socially. I suppose later I should come to feel that not only do not wish to be a professional theologist, but that one or more of the other religious systems has much to offer me—perhaps even more than that to which I was born? Am I a disloyal person if I espouse that which seems to me more ample and more true, or if I try to work out for myself a synthesis of the best teachings of several? To quote popular theology again, there is a much-beloved spiritual which runs: "Gimme dat ole-time religion—it's good enough fo' me." *Is* it good enough, necessarily? The question is, if anything, a more serious one than that of national patriotism. Most of the time one's relations to his country are quiescent and demand little thought; but if religion be anything today it is an attitude toward life as a whole and can never for a moment be left aside. Saying the old religion "is good enough for me" is tantamount to parading the fact that in every thought, attitude and deed one has bound up his judgment in a little packet and handed it over to the past, quite regardless of the offerings of the present or the intellectual and spiritual allurements of the future.

Many of us are related as students, professors, directors, or alumni to some institution or other of higher education. Should we be loyal to it, and if so, how? It so happens that my own university in America flagrantly violates two principles which I personally hold dear; it is one of the very few great universities which has never admitted a Negro student and never means to; and it is supported from its oldest foundation-stone to its newest collegiate gothic pinnacle by the endowments of super-affluent capitalists, a class I dislike. Should I wish to send a son of mine to a place which excludes one of the greatest sectors of the American population and should I year after year pay class insurance which goes to swell the already tremendous endowments? Is it disloyal of me thus to write about my Alma Mater in the public press? A similar saw can be quoted in this connection, one which for some time has been quoted in America against perfervid college loyalty: "I'd die for dear old Rutgers." As one looks back over the class-reunions he has seen in his own university, he can think of many middle-aged men for whom college loyalty was the warmest affection enshrined in their breasts. This might be regarded as an earnest of a deeply loyal nature; or, on the other hand, it might seem to some a sign of retarded adolescence, an indication that greater and more inclusive loyalties had failed to come along and put this one in its true perspective.

Once more, there is the question of loyalty to that institution in which one earns his living. If one works for National Biscuit or the Rockefeller Foundation or Santiniketan or

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

Tata Steel, how much and what kind of loyalty is forthcoming from him? Must he praise everything which they do, make, or say, even when he believes the exact contrary? And is it indecorous for him to say in public what he believes about their major policies? In the negative this much can be said: There is a possible philosophy of employment which would call only for a man discharging the duties for which he was engaged to the utmost of his ability; meanwhile he is free to think and say what he wishes about the whole, it being clearly understood, of course, that he runs the risk of being discharged as a result. Has a high official in the Public Works Department the right to publish adverse facts about the Education Department, or does the fact that he receives a salary from H. M. I. G. mean that he forfeits the right to an opinion in public on any and all of its departments? Put in its broadest sense the question becomes: When a business concern purchases the services of a man, does it also purchase his conscience, his intelligence, and his human right to express himself in public?

Lastly, we come to the most difficult arena of life in which to compute the value of loyalty, *i. e.*, that of the family. In India, where families ramify indefinitely and where loyalty to them has traditionally been considered one of the very great virtues, the issue is an even greater one than in the West, where it is severe enough. There are many kinds of family loyalty, including obligation to pay back to parents economic hardships borne by them in the child's infancy; shaping one's life so as to carry on the family's traditions and aims; obeying the will of parents in marriage; and upholding a family member when one knows that he is entirely in the wrong. This aspect of loyalty reaches its apogee in marriage, and if it can be shown that even here complete loyalty is not necessarily a good thing, perhaps this will indicate that the other relationships can also bear inspection. We will leave aside such matters as the rapidly-growing acceptance of divorce in the West, and experimentation with *trial-marriage* (both of which are corollaries to the proposition that instantaneous, complete, and eternal loyalty are not necessarily involved in marriage). Let us think of a single pair. If, after ten years conjugal union resulting in three children being born, the husband begins to beat the wife, to neglect the children, to give himself to all the major vices, and to absent himself from home for weeks on end, is the wife called upon to be loyal to the end? And even if after two years and the birth of no children at all, the husband finds that the wife is a chronic shrew and nag, that she shares none of his life-interests, and that living with her only prevents his becoming anything that he might become, should he be loyal for the next forty?

I can well remember the day eight years ago when I came to an understanding with my mother about loyalty. I told her plainly that though I would find the deepest joy in contributing to her happiness when possible, I should, in all matters which seriously affected my own life, make my own choices, even if they were diametrically opposed to her wishes. Although to some this may seem a breach of loyalty, in our own case it only put the relationship on a firmer ground of comradeship, and thenceforth I always valued and sought her advice even more than theretofore.

II

What has preceded is intended by no means as a wholesale indictment of loyalty. No society of any kind is possible without certain adhesions which engender loyalty. The opposite of any kind of loyalty at all is the sheer individualism of the pre-man wandering through the jungle in search of food. Obviously, if there is to be common enterprise, there must be loyalty of some kind. If most of us would agree that crass individualism of this type is undesirable, perhaps there will also be some unanimity that 100 p. c. loyalty in any of the relationships dealt with above is hardly more palatable, and of course it would be very easy to show how terrific conflicts between those two agencies would make it impossible, and eventually throw the matter back upon private judgment. Instances are unnecessary, but just to make the point clear we will recall the case of a man who felt patriotically impelled to go to war but knew that it was to kill his father if he did; or of one whose re-

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

ous convictions drew him further and further apart from his wife. Galsworthy has already dealt sufficiently with this point in *Conflicting Loyalties*. It may all be summed up by saying that even if this type of loyalty were desirable, it is clearly impossible.

But loyalty there must be, and it now remains for us only to describe the form which it should take. But "form" it will *not* be, for individuals and societies vary, and one man's meat is another man's poison, one country's is another country's, etc. The trouble arises from seeing the question too narrowly and demanding of all others that they should have the same kind, quantity, and intensity of loyalty as ourselves—or the same lack of it. Loyalty is not so much a virtue or vice as a type of temperament, and there will naturally and inextricably be more or less of it in certain individuals. Although such loyalty may not appeal to us, how many noble books have been written about family loyalty and how many noble lives have been offered at its shrine. Some people's whole psyches are tied up with their own family groups, and if the aims and standards of the families be high, such deep affection and co-ordinated effort produces very valuable results. A few months ago an aged and revered teacher of Santiniketan passed away. He was one of the original staff of the institution and had poured more than forty years of his life into it. There are men in high positions all over Bengal today who look back to his leadership with grateful affection. No doubt in forty years he must have witnessed a good many things which were not as he or anyone would have wished them; this is inevitable in such an institution. But I imagine he never wrote a word against the *Ashram* in his life. It lay too near his heart. Who could deny that such loyalty to an institution has its uses, both in its inner life and in the contribution it is able to make to society as a whole? Again, take patriotism. There is a certain stage in the evolution of national life in which it seems the highest of the virtues. Recently we honoured the memory of C. R. Das, who stated plainly that his religion was patriotism. Garibaldi will always be honoured in Italy, George Washington in America, and Lenin in Russia—all as great patriots and as men who were willing to lay aside lesser loyalties and give themselves to the one great issue at hand—the freeing of their countries. And then there are the Jesuits. Some time back it was my pleasure to meet a group of young Jesuit fathers in Kurseong. Most of them were my countrymen, and they had a warm affection for their motherland, but it was nothing as compared with the deep fire of their loyalty to the Catholic Church. For centuries Jesuits have known no jungle too thick to penetrate, no desert too dry to traverse, and no sea too wide to encircle, in their effort to carry the Gospel to the whole world. Whether or not one can agree with their theology, he cannot deny that they have brought great blessings, both temporal and spiritual, to millions of needy people. Even college loyalty has something to say for it, especially when it represents a forward step in widening loyalties. I can remember three girls at a student Christian conference in America who took a considerable plunge in deciding that they should stop being loyal to their sororities (women's fraternities) and begin to be loyal to the greater good of their university as a whole!

But there is a possible loyalty beyond any or all of these, and it is its adherents who are sometimes branded disloyal by members of the other cults. It is the loyalty to truth in its fulness and to mankind in its entirety. If one once admits that individual development is along lines of expanding loyalties, it is the only logical stopping place. Many who would not feel particularly guilty in jeopardizing American business interests might stop at economic practices and standards which endanger the well-being of man as a tribe. Likewise, those who will not in all cases and under all conditions obey their parents' will might prove considerably interested in measures to humanize child-birth or to provide widows' pensions. And even those who desert their creeds and churches may still maintain a considerable thirst for the truth about God, man, and their relationship. Only they see things dynamically, and are, therefore, chary of hooking themselves up to any specific and limiting loyalties lest these prove lethal to the larger and more universal ones.

The Hindu religion has always been wise

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

in realizing that there are at least two kinds of good life on the earth; that which is attached and that which is unattached. There has always been the "holy" man and the "worldly" man. Few of us today would care to be either holy or worldly, but there is nevertheless a good deal of meaning in the ideas behind the words. Some will be agriculturists and herdsmen and some explorers, and both will contribute to human economy. But none will entirely fall into either group, at least none whom we shall take seriously. If a few wish to plunge into fanatic loyalty on the one hand or to fly away into the unreal freedom of the recluse on the other, let them do so. The rest of us will be found somewhere along the middle distances of attachment and detachment. But this much (at least) is sure (to paraphrase the famous lines of Shakespeare): loyalty to any person or agency is worth but little to him or it, to oneself, or to the world, if it be bought at the price of a fundamental disloyalty to the truth as one sees it.

ALL-INDIA ART EXHIBITION—CALCUTTA

By J. K. SEN

THE All-India Art Exhibition held in the Indian Museum this year attracted considerable notice owing to some extraordinary features associated with its success. Calcutta is accustomed to exhibitions and pageants every year during the X'mas holidays and a huge public flock to the many attractions of the city. Some art-exhibitions also naturally open their doors at this time, when the season is in full swing. The All-India Art Exhibition held this year owes its inception to some new ideals. It was held under the auspices of the Academy of Fine Arts—an institution recently started in Calcutta. It invoked a storm of resentment in some other parts of India for no other reason than that it ventures to crystalize an All-India Organization consolidating the multifarious art activities of India as a whole. One would have scarcely suspected that any such institution whose avowed object was an adjustment of the vast field of Art could arouse jealousy or heart-burning in any other place. Coteries and cliques there must be here and there and new schools or passing vogues must exact their homage in their own ways. There could, however, be no question that some place to study all these movements as a whole from year to year is a necessity. A vast amount of art-activities is controlled by the Government of British India and those of the Indian States and they should not be allowed to stand alone, for their co-operation is a *sine qua non* to the success of any All-India Art Exhibition worth the name. The success of this year's affair could be gauged by the fact that the leading Indian Princes not only graced the Exhibition with their presence but extended to it their warm patronage. Their Excellencies the Viceroy and Lady Willingdon also evinced a keen interest in it and their visit was intended practically to put on a firm footing the foundations of this concern. Sir John Anderson too, so long unknown as a lover in this quarter, came forward to shower his blessings and in a neat speech remarked that the Jubilee of this Art Academy would be an accomplished fact in future. These and other features seemed to have created a halo of hope round the activities of the Academy of Fine Arts, one of whose Secretaries undertook the arduous task of visiting the leading centres of art in every part of India so as to enlist their enthusiastic support for the cause.

The scope of the Exhibition was happily wide enough to embrace within it the art activities of both Eastern and Western types and also the new forms of beauty through which the world is now eager to shadow forth its new experiences. The authorities also made arrangements to exhibit original paintings of some western masters, such as those of Sir Edward Burn Jones and Alma Tadema and these produced a great impression on the visitors who had never an occasion in India to see a genuine original masterpiece of this type. There were also types from oriental orthodox and archaic schools and as usual they monopolized the attention of the foreigners who are fond of the "curios" in the East. In fact the corridors of the Indian Museum constituted for a time a picture gallery of an entrancing nature. The range of pictures reflected the many moods India is passing through and the mosaic of her experience got reflected in the many specimens of creative enthusiasm exposed to public view. The common ground of beauty of every type or class could, however, never be lost sight of in

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

exhibition of this type. Beauty is not to be relegated from racial or territorial view-points and is a common possession of humanity. No one fails to enjoy a St. Sophia or a Taj—an Ajanta or a Horyuiji—because of their ethnic or racial background. It would be shocking to introduce these limitations in a consideration of the cosmos of beauty. In this Exhibition all the schools that have any chance to impress the Indian mind—the most go-ahead and the most archaic—had their chance to secure the approval or praise of the visitors who thronged the Indian Museum. We noticed the brush-creations of the ultra-modern expressionist of India in a field filled up with specimens of solemn and restrained beauty of Indian ancient type. In fact India confronts today a parting of ways. The lovers of the old and the antique, the bizzare and the archaic die hard and India is hardly free to breathe in the new atmosphere that has overtaken the world as has been the privilege of Japan, China and Turkey who refused to compromise their present outlook with the lingering love for the ancient and the defunct, which had no doubt their unquestionable draws. The nations of the world today whether in the East or the West are confronted with problems that were unknown and unthought of only a few years ago and they are out to express their new experience in fresh terms and settings. This has resulted in the cementing of a common fellowship in the world today. While the other nations have in a common creative call taken on their back—Atlantas-like—the burden of a common aesthetic urge, it does not behove India to remain aloof from this forward march which would mean to her a loss of a most vital nature. The world today is ready in shreds and tatters and it is only the visionaries of both the hemispheres who are trying to create a cosmos out of a chaos. No doubt the tongues of war and disruption are at their sinister business forging weapons for mutual destruction but let no one forget that the infinite man behind is not idle but is rapt in weaving new visions of beauty in the term of the man of today on his Cross. Out of the travail of today the coming order is casting its shadows and the very fetters of the age might prove the charters of a new freedom tomorrow. Not the flicker, the shadows and the mock phantasies of yester-day, whether of the East or the West, but the grim realities frowning ahead that must find their rhythmic imprints on the canvas of modern art. Not fiddling away with the past order becoming itself out before our very eyes but angering forward the joyous ensign of today—that should be the task of the artist today. From Europe is not today what she was a decade ago. New hopes have emerged, new visions flickered and new cycles evolved out of the agony and chaos of a war that left a heritage of strange wealth for ages to come. In the East the shock of that explosive outburst reverberated in no small measure. In Japan the world realized a new transfiguration through the shadows of her wonderful art, which visionaries stirred with hashish of modernism hurried to offer to the world. China also came forward with a grim response born of a realization of actualities which gave no quarter to effete and antiquated dreams. There is no scope for idling away with fantastic dreams, finding solace in a pigtail philosophy offering a questionable solution—nor a fez-worship within the harem of a Turkish bath following the smoky trails emerging out of pipe and conjuring up Arabian Nights with demons coming of pitchers. These were the lullabies to soothe the orientals of yesterday and keep them out of harm's ways. The epoch of 'shorts and shirts' however spells a new philosophy even in the East where the new generation has hurried forth from his home in the quest of a new mirage in the burning sands and under a scorching sun: Who knows what glad tidings of great joy await these new pilgrims on their journey?

The role of India in these new settings must, therefore, be seriously considered. Is she to remain outside the pale of the new march? Should her artist while away their precious soul-force in search of touchstone lost for ever? It is a pleasure to find in this Exhibition silent forces at work which reveal the unity and the universality of the growing world-consciousness. Even India seems to be suffering from the malady of the world and she seems to be anxious to express herself in the new language of art that is getting itself broadcasted from day to day. The world is nearer today to man than at any time in past history; swift means of locomotion, of transference of news, in fact, of expression as a whole have worked out a new miracle undreamt of yesterday. These must have their reflex in the shaping of a common culture today. The age of machine is exacting its toll of victims and while it is effecting a new metamorphosis in international relationship through breakdowns outside and unemployment at home its invasion of our hearths and homes has none the less been less acute. In India a curious amalgam of ideas and an indecision of thought hound every home in no uncertain ways. Some of her people are yet found to harp on the glory of yesterday and thus create a type of pseudo-orientalism based on mock sentiments which are taken quite seriously. The western partiality for oriental curios produced a type of commercial art in Japan and the same has happened in India too. On the other hand, every home is getting daily filled up—there could be no denying the fact—with photographs turned out in their hundreds and hailed in every home. This call for the photo-graph—the most hollow type of realistic rendering—reveal that the outlook in India too is not the same as it was yesterday when the drawings of artists only found universal favour through their old world charms. The orthodox oriental mood,

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

therefore, seems to have got suffocated with the pressure of this new lure. This is leading to a steady deterioration of the creative impulse itself. The call of beauty fails under the circumstances to function in a normal way if the artists are harnessed to produce things after defunct forms. The age that has ebbed away must not dictate the terms of the figuration of today. The violation of natural laws leads to a chaos which could never be remedied easily. There is no question about the exceeding beauty of creations of the classic age, but unfortunately the realities of today are different. In this Exhibition we find some of the artists tackling these new problems with courage and vigour. Indian culture, however, must have always in it the creative flavour and aroma of ages gone by and even in expressions through the aesthetic language of today that aroma is not lost and the subtleties of Indian psychology leave their muslin-like impress. Even in the field of portraiture an Indian artist offer rhythmic qualities which it would be difficult to encounter elsewhere. This Exhibition furnishes us with an idea as to how India might contribute to the wealth of creative beauty in the terms of the modern age. In fact, one gets astonished at the achievements of some of the young artists. The black-and-whites, water-colours and the etchings reveal successful fields in which the artists have used their brush with success. In fact, the new nationalism of India is really working itself out in a sphere in which the world can appreciate her at her best. The West, in fact, offers her the hand of fellowship in this new brotherhood in the realm of beauty. To omit these new types of expressions from the category of modern expression even in India means a lamentable blindness to realities that must have their say and probably must sweep away some day the mummied doctrines of a fossilized age. The new desire for world-fellowship in art is working surely but slowly. In India Tagore the Poet came forward to express India's response to the call of the world and he couched it in a language intensely modern—certainly not his own. The music of this poetry was heard from the farthest corners of the earth. His paintings too cast after the modern expressionist type had their queer urge in a kaleidoscopic series of figurations. G. Tagore with his painting was another link to connect India to the world of today while even Abanindra Tagore with his portraits and animal figures show that he refuses to remain for ever in the cell of an oriental hermit away from the multi-coloured expressional epic which the world is anxious to figurate. Neither the world of a Shakespeare, an Angelo or a Dante in the West—not that of an Ajanta or a Genzi in the East—but a world intensely alive and burning with the rush of live problems and forces dashing past us and suffocating us by their urge—should be the immediate concern of this age. In India the problems of the world and their expressions take a new colour in the light of her synthetic outlook. She has always been the haunt of the artists of the world, for her wealth of beauty has no parallel elsewhere. Why should not Indian artist be alive to it so that its many phases might be delivered as messages from the East? The artists of the Exhibition, organized by the Academy of Fine Arts, deserve well of the world. Through them the world of art must be freed from the coarse commercial octopas that is eating into the very vitals of Indian figurations. A ramble through the exhibition gave one an idea of the weird of Indian atmosphere—the weird gifts of nature the marvellous colours of the sky and the dramatic situations with which one is confronted so easily in this country. The panorama of bathing ghats, the village pageants, the misty mornings, the scintillating glows of vanishing twilights, the sun-burnt desert and the variety of ethnic forms—all crowd the canvases in a bewildering way. In no single centre of the world could one find rhythmic wonders of such divergent types. The artists of the west therefore always flock to India for inspiration. It is proper that her artist too should explore the fountain of her expressive beauty. The expressions of India must not satisfy merely the lovers of the antique and the curious who seek to stifle the inspiration of the passing hour. The organizers of the Academy have however given sufficient scope not only to the new artists wielding modern weapons but also to the erratic enthusiasts of the orthodox oriental school. Promod Chatterji, Sarada Ukil, Ramendra Chakravarty, Bhuban, Barman and others are there to occupy a decent niche with their haunting dreams. The charming presentations of an old-world idealism always find a response in this country for the present age is to some of us a nightmare of the worst type. Like *kirtan* music, Vaishnava poetry and old folk-paintings, they have a music of their own that could never be dismissed or rivalled in their own field. Perhaps Jamini Roy's archaic school reveals a stronger creative vigour which must find response in these days of weak sentimentalism and sophisticated fads. Productions of this type produce an effect similar to enacting a Shakespearean drama on a modern stage with which one feels disgusted at this time. But the attempts of other artists in different fields to put new feathers to their caps are very significant too. Excellent landscapes in a setting with wonderful warmth of colour not often found in western products, appeared as revelations before the visitors. Their subtle charm and subdued tones could only be supplied by Indian artists alone. The artist of the West and of India have come and joined hands in an attempt for an expression of universal beauty. The universal language of art is a common medium for all. Let not artists from the East falter and grow nervous when they find new forces, ideals

...modes of expression before their eyes. The ...ctural possessions of the worlds are now in ...e melting pot. The heir-looms of yesterday ...e suffering a strange metamorphosis. A thing of ...ary ventures today to transcend the limitations ...h which it was fettered in days gone by. The ...setting offered today in a common world ...sciousness is far-reaching in the gestures and ...ental propositions are being put forward ...in new colours and rhythms. It is a ...sure to find in this exhibition how divergent ...s have been brought together to constitute ...erb aesthetic feast which all could partake. ...ndranath Prodyot Kumar Tagore, through whose ...s the function had been a great success, must ...ngratulated and the secretaries too should ...e their due share of commendations for their ungrudging labour in this connection. The well-known artist Mr. Atul Bose has been a leading spirit in connection with the organization not only of the Academy of Fine Arts started under happy auspices but also of its offspring, *e.g.*, the All-India Art Exhibition which has been accepted as a great venture of the day. One hears that the sale of the pictures brought in a sum of nearly 25,000 rupees which is not a mean sum for poor artists suffering from neglect and poverty. In fact, it has been a great achievement which has catered to the spiritual hunger of the people and has been instrumental in offering the greatest possible support to artists of all types in these days of depression. We hope that the Academy would continue its beneficent activities in these lines in future as well.

LIQUIDATION OF ILLITERACY IN SOVIET RUSSIA

By Dr. G. S. KHAIR, M. A. (Bombay), A. M. (Columbia), Ph. D. (New York)

Education For All

WHEN I visited the headquarters of the Liquidation of Illiteracy Society in Moscow, the directors told me a touching experience. An old woman ...ed near a department store with a big ...-board over it. She saw this sign a ...sand times in her life, but the big bold ...ers did not mean anything to her. She ...ed one of the literacy circles. After three ...ks, she walked in one evening and burst ... tears. Today she could read the sign-...rd, an unexpected event in her life. This ...y is typical of the transformation going ... in the adult population of the Soviet ...ion.

Russia has produced the educational ...vel of the twentieth century. Within less ...n fifteen years, she has wiped out the shame ... illiteracy from her society. In 1917, ...enty per cent of her people could not read ...d write. After fifteen years of strenuous ...k, the percentage of illiteracy has been ...ught down to twenty-six. This includes ...y old people and those that live in remote ...ts of the country. These unfortunate ...ple lost their chance of learning the letters when they were young. Now the school is being brought within their reach. Take an evening walk through any of the city streets in Russia; you will see hundreds of grown-up people going busily with brief-cases in their hands. They are going to school. If you peep through the lighted windows opening on the streets, you will see one or two schools in each block. Men and women are sitting with books and writing materials in front of them. Thousands of such evening classes are scattered all over the country—in factories, on the farms, in the red army, wherever three or more people can come together and learn the mysteries of the three R's.

Literacy Under the Czars

Today the Russian people seem to be hungry for education. For centuries, they were kept in ignorance and illiteracy by the Imperial Government of the Tsars and their bureaucracy. Occasionally there was an enlightened monarch who favoured education and introduced some free schools. But on the whole education was looked upon with suspicion. The rulers were afraid that ... would only help the forces of freedom dormant

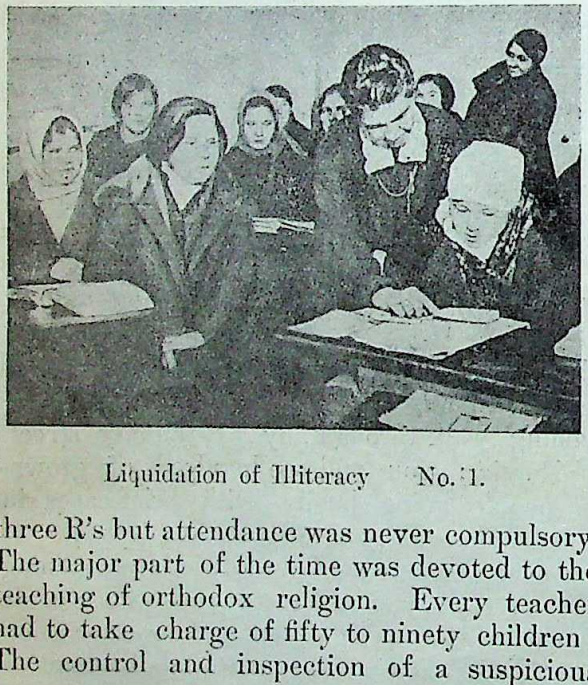
among the people. Shishkov, the Educational Minister of Alexander I, revealed the mind of the Russian rulers when he said, "To teach the mass of people or even the majority of them how to read, will bring more harm than good." No wonder that in the scale of Western nations, Russia stood lowest in the field of education. In 1904, the percentage of school-going population was three in Russia, as contrasted with twenty-three in the U. S. A., nineteen in Germany and sixteen in France and England. A few free schools imparted instruction in religion and in the



Liquidation of Illiteracy No. 1.

three R's but attendance was never compulsory. The major part of the time was devoted to the teaching of orthodox religion. Every teacher had to take charge of fifty to ninety children ! The control and inspection of a suspicious bureaucracy was so thorough that it crushed out of the system everything that had the possibility of enlightening the people.

Education as a Social Tool

Educational change follows in the footsteps of a political change. The United States, after their separation from England, started on a new experiment of democratic education. When the monarchy collapsed and a new form of Government was set up in Germany, the old educational system was overhauled. The recent National Socialistic regime in Germany is ushering in drastic changes in the educational programme. The same is true of Fascist Italy. In Russia, the political change of 1917 was followed by a change on all fronts, including education. I no other country has the cultural change be so thorough-going as in the Soviet Union.

The Russian leaders were faced with t task of uplifting a hundred and fifty milli people, kept in illiteracy, ignorance, a poverty, for centuries. At least a centur more would have been required to teach thes people to read and write through the proces of a normal cultural evolution. The Russian wanted an instrument that would bring abo a speedy transformation in society. Th took hold of education as a means of soci uplift. The development of the Sovi educational machinery with all its varie and immensity, is simply unparalleled in th history of human culture. Many countri have used education as an instrument t achieve national ideals, but no one has be so logical, so definite, and so thorough in th application of this principle to a conscio social purpose.

The political change in Russia had est lished a new social order. To insure the l of this new society, the leaders wanted t educate the proletariat in its underlyi philosophy. Keen students of the histor of radical changes all over the world, th Russians wanted to avoid the errors commit by their leaders. Most of these changes have be followed by reactions, because the comm people were never thoroughly initiated in the principles of the new social changes. T avoid that mistake, the Soviet leaders ha been very quick in taking hold of the educa tional machinery and moulding it in favou of the new ideals. Education in Russia i something more than learning the three R and the other subjects of the school curricul

During the Tsarist regime, the worke and farmers had little opportunity for educa tion. When, therefore, the champions of t proletariat came into power, the gates learning were thrown wide open to the mass of workers and peasants. The emancipati of the people from illiteracy became an im portant item in the programme of the ne regime. On December 26, 1919, Le signed the decree ordering the liquidation illiteracy in all the states of the Soviet Uni For a nation which has to liquidate illiteracy of more than three hundred milli

...ople, the recent educational activity in ...ussia is worth careful perusal.

Organization for Literacy

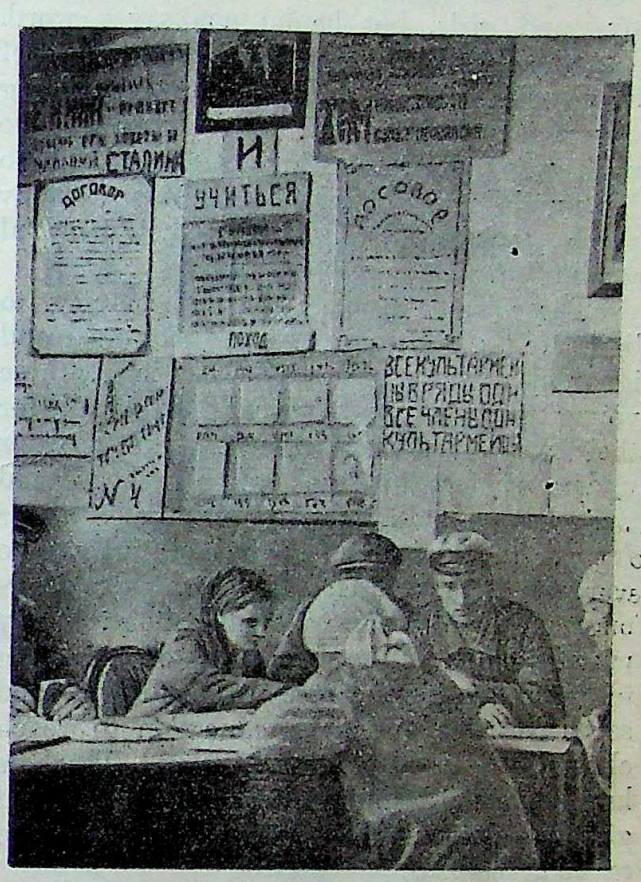
It is important to note that the movement ...w called "Down with Illiteracy," is carried ...o mostly by voluntary agencies backed up ...d encouraged by the State. It is the work ...f the party in power and its branches through- ...the country. The personnel of the move- ...nt is organized on the basis of free service ...the Youths and members of the party. ...the head of the whole organization is the ...preme Council to plan and direct the ...vement. Below this are the Provincial ...ncils and the Regional Councils to carry ...the policies and programmes laid down ...the Supreme Council. To attend to the ...ils of the movement the Supreme Council ...organized into various departments :

(1) Department for organizing Schools
(2) Department of Study and Curricula
(3) Department for mass Activities
(4) Finance Department
(5) Planning Department.

...ll the Provincial Councils have similar ...partments or brigades.

...The local councils start their work by ...ing out the extent of illiteracy in their ...a. Public opinion is then organized in ...our of carrying on literacy activities there. ...th literate and illiterate persons participate ...the movement. Units or Clubs are estab- ...ed in factories, in workshops, on the farms, ...the army or wherever it is possible to ...ther a few persons anxious to learn. To ...rm a unit, it is enough to have at least three ...mbers. There are a number of people ...o are half literate or who have lapsed into ...eracy. Once out of the school, they had ...casion to use their training for a number ...years. These people now attend the ...eracy centres.

The whole movement is self-supporting. All ...e members pay a certain amount of regular ...scriptions. Factories and other organizations ...ve contributions. The subscriptions and ...ntributions of the members are sufficient to ...y educational materials and to defray the ...all expenditure of the local establishments. ...The sincerity and enthusiasm of the ...vement is shown by its symbolism. Buttons ...d insignia of various types are given to the workers of this cultural enterprise. The dynamic force of the activity is shown by the military terminology borrowed for a peaceful propaganda. The departments of the District



Liquidation of Illiteracy No. 2.

Councils are called 'brigades' and the voluntary teachers are called the 'Cultural Army'.

I visited some of the centres where this work is carried on, and there found persons of all ages, men and women. The directing and organizing work is generally undertaken by elderly persons and the responsibility of teaching is accepted by the Komsomols. This is an organization of the party for young people of the age of thirteen to twenty-four. These youths attend to their school or college work during the day, and devote their evening time to social work, literacy being the main item at present. While I was in Moscow last October, I visited a Secondary School by day. Curious to know what these young people did in the evening, I again visited the school at night and found the building alive with human beings. In one of the classes, I saw about fifty boys and girls, about the age of fourteen to eighteen. One of the boys was in the chair

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

and two or three others were making some impressive arguments. The Russian language seems especially fitted for fluent speech! A teacher was sitting at the back among the boys and girls, but he did not say a word. The guide explained to me the proceedings of the meeting. The boys and girls were working to promote literacy in their district. The work was not progressing satisfactorily. So the pupils were trying to find out ways by which they could discharge their social responsibility more efficiently.

These are the people that are helping to liquidate the illiteracy of the backward and ignorant masses of Russia. Sometimes, these young teachers are physically so small for their work, that they have to take a chair under their feet to reach the blackboard and write letters for their grown-up pupils. It is funny, but unique for its sincerity. To conduct literacy circles, voluntary teachers ought to have necessary qualifications. They must have had at least four years of schooling to teach the first stage adult students and seven years of previous education to teach classes of second stage literaey. Teachers have to pass also through training courses that give them some elements of pedagogy and teaching methods.

The age of students learning at these centres of literacy ranges all the way from sixteen to fifty. In the beginning they are very pessimistic about their ability to learn at this age. As the veil of mystery over the letters is lifted up, they grow more and more confident. No fees are charged, and even books are supplied free. Owing to the greater percentage of illiteracy among women, most of the work is done among them. When mothers cannot go out of their houses, social nurses visit them at home to give the necessary training.

Eighteen months is the minimum time required to make a person literate, with nine to eleven hours of work per week. The New Russian week has only six days.

Students have to pass through two stages before getting the certificate of literacy. The first stage is reached after nine months when the adult student finishes the two years work of children. A test is given in simple reading and elementary arithmetic. The second stage comes after eighteen months when the stud... has finished the four years curriculum of t... elementary school. He is given a second te... in fluent reading, grammar, arithmetic, histor... and geography. But the Soviet concepti... of literacy does not stop with reading, writi... and arithmetic. In Russia education is nothi... if it is not accompanied with a social ideolog... The definition of adult literacy is given b... M. Kaliniki, Chairman of the Down wi... Illiteracy Society:

> Under the present conditions, to wipe o... illiteracy does not only mean to teach people t... read and write, but it is necessary to make th... understand what they have read, to teach them t... digest the printed matter in their heads, to mak... a man politically literate, to create a new m... You cannot now teach without creating ne... men.

The force of this statement will be realize... when it is known that the text-books for adu... education deal with contemporary soci... political, and economic problems and socialis... ideas. The apathy and indifference of th... masses towards learning is the greate... difficulty in such a movement, especially i... India. Russia overcomes this obstacle b... creating an environment whereby the farmer... and the workers feel that some valuab... experiences are awaiting them when the... learn to read and write. To stimulate th... desire for learning, various programmes s... organized in addition to the regular classe... There are excursions to local museums, movi... libraries, discussions, and the famous Russia... wall newspaper which is practically a featur... of every organization.

Evidence of Progress

One is apt to become suspicious about th... success of an organization which rests mos... on voluntary efforts. The figures show... the rapid fall in the percentage of illitera... during the last fifteen years will speak f... themselves.

Year.	Percentage of literac...
1897	28.9
1920	44.4
1926	52.8
1931	73.6

The special schools for the wiping out... illiteracy have been so popular that in t...

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

years the number of students has more than trebled.

Year.	Number of Pupils in special schools.
	456,000
1921-22	1,554,000
1926-27	13,631,000
1931-32	

Even these figures seem cold testimony to the growing literacy in Russia when one sees the living evidence of an intellectual awakening among the people. Coming through Europe and walking through the streets of Moscow and Leningrad, I was struck by the number of book-shops along the streets, all crowded with young and old people. The output of literature in Russia is tremendous because the number of readers is rapidly increasing. There is no fear that these people will revert back into illiteracy. Their interest in reading is constantly kept fresh by the publication of literature on living problems affecting the farm, the factory and the army. The publication of the wall newspaper is also a great stimulus for reading and writing. I wanted to test the reality of this advertised literacy. Armed with a Russian dictionary, I walked through the streets of cities. When in difficulty, I showed the Russian printed word to question any person who came across. During my short experience, I did not meet a person who could not read. There is not the slightest doubt that literacy has rapidly spread in Russia. The Soviet leaders are confident that illiteracy will be completely wiped out of the country during the next few years. Dr. Chatsky, one of the leaders of Soviet education, said to me with the conviction of experience, "In five years, our country will be one of the most educated countries."

Literacy is an instrument for building up a common ideology among people to hold them together for a common purpose. The printed word is a powerful means of communication in the twentieth century, but ninety-two per cent of India's people are still unable to make use of it for their enlightenment. The farmers and workers of Western countries are raising up their educational level. This is bound to affect the modes of material production and the standards of life. Can the illiterate farmers and workers of India stand competition with them? To make the whole Indian population literate would take more than two generations even through the immediate introduction of free and compulsory education. To accomplish the same task in a single generation, it must be organized as a mass movement. If the call comes from the right direction, the spirit of voluntary effort and youthful enthusiasm are present in India.

MR. K. P. JAYASWAL AT THE ORIENTAL CONFERENCE

By K. K. ROY, M. A.

DR. Arthur Berriedale Keith, writing to the President on the papers of the Sixth Session held at Patna, observes (31-1-34):

> I have glanced at a number of the articles from which I learn with pleasure that, as India is prepared to take over the control of her government from British hands, so she is amply endowed to carry on, apart from Western aid, research into the inexhaustible mass of records of Indian achievement in literature, thought, science, architecture and history. This is all the more desirable, since in this country there is clearly visible a diminished interest in research, and since it is clearly easier to accumulate in India the necessary material for serious research.

The contribution of Indian scholarship at the last (seventh) session of the Conference, held at Baroda, will be found still more striking.

The presidential address of Mr. Jayaswal was heard with rapt attention by an audience of some two thousand people gathered on the floor and the galleries of the magnificent Hall of the Nyayamandir (the Baroda High Court); His Highness the Maharaja Gaekwad, himself a finished speaker, at the close of Mr. Jayaswal's address broke the printed programme by taking the President's permission to speak once more, and in an extempore speech which was appreciated more than even His Highness' first address, declared that the President had marched from point to point in triumph as his name implied.

H. H. the Maharaja Gaekwad's Opening Address

His Highness Shrimant Sayaji Rao III, Maharaja Gaekwad of Baroda, made the occasion of the presidential address a state affair. His Nyayamandir was tastefully decorated and at its Rajput gate was held the State *naubat* music. The President arrived and was received at 4-45 P. M. after the audience had taken their seat An interval passed after the arrival of the President; His Highness accompanied by Her Highness the Maharani Saheba arrived in State in his famous gold coach drawn by four black Arab horses, escorted by a body-guard of horsemen. The National Anthem of the Gaikwad was played and the heralds (*Nakibs*) announced the presence. Their Highnesses were led to a seat placed next to the platform of the President.

In opening the Conference as its patron, His Highness gave a survey of the field of research in general lying before the country, described his "own humble efforts" and pointed out the vastness of the work of publishing texts yet lying ahead of his own Oriental Institute He struck a novel note in pointing out the necessity for making the results of researches available to the general public through vernaculars. The Gaekwad is always practical and he rightly told the country to make the science of history an applied one.

Asiatic Culture

The same note of originality runs through his cosmopolitan suggestion regarding Asiatic culture:

> While we Indians should know our own history to see it in proper perspective, it has to be studied as a part of Asiatic history and requires at the same time some insight into the cross fertilization of cultures and the migration of races both eastwards and westwards, with the consequent conflict and synthesis of cultures. It is time our universities appreciated this aspect of modern education. The countries of Asia must understand one another and prepare to work out a new partnership in the light of past cultural relations.

Chief Points in Mr. Jayaswal's Address

Mr. Jayaswal opened his address with a brief but happy expression of felicitation at the Conference being held at Baroda under the patronage of His Highness the Gaekwad. Describing His Highness as the "modern Bhoja" Mr. Jayaswal said:

> King Bhoja made gems of ancient Hindu literature available to his contemporaries through his treatises and cyclopaedias: Maharaja Sayaji Rao III is repeating the process through his world-famous Oriental Series. He has led Indian renaissance by various measures including personal discourses, the latest being one before the Parliament of Religions at Chicago. The great Hindu Prince of Peace—Lord Buddha—you find installed prominently in his magnificent capital. A bust of R. C. Dutt is honoured in the Hall of Audience at the Lakshmi Vilasa Palace where Dr. Tagore, Sir C. V. Raman and other scholars have almost annually lectured. In his State every village possesses books; in his capital his subjects have at their disposal one of the largest libraries in India.

March of Indian Scholarship

In reviewing the march of Indian scholarship he said that he was relieved of the task as Prof. Sylvain Levi, a former President of the Oriental Conference, had just done it in a letter addressed to him, dated November 7, 1933 in which Prof. Levi said that since 1921

> Indian scholarship in India has made wonderful progress.....The many periodicals now

CC-0. In Public Domain. Gurukul Kangri Collection, Haridwar

Digitized by Arya Samaj Foundation Chennai and eGangotri

published by Indian savants, can, almost all of them, compete with the best scientific journals published in the West.

Inviting Indian scholars to the study of the Avestas Mr. Jayaswal said :

Iranian and Hindu are the twin pulses of that whole grain which is known as Aryan civilization. In the person of Sir Jivanji the two were united and his personality was a constant reminder of that unity in the sessions of our Oriental Conference. That unity, I am glad to see, is being realized both here and in modern Persia which has deputed Prof. Pour-e-Dawood, the leading Persian scholar to Santiniketan whom we have elected as one of our Sectional Presidents.

Pre-Historic Period and the Flood

Turning to the field of Indology proper Mr. Jayaswal observed :
